

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

PREFACE.

THE INTERNATIONAL YEAR BOOK for 1901 is the fourth volume in the series. Its three predecessors have been received in a manner to justify the view of the editors and publishers that a work of this kind would be widely useful and favorably regarded. It was expected that it would meet with some criticism in detail and that suggestions would be made as to possible means of improvement; but in the numerous and for the most part highly commendatory press notices and reviews there has been little of such criticism or suggestion. As indicating approval, both of the plan and of its execution, this has been most gratifying to the editors. At the same time criticism of a constructive sort would be most welcome and would undoubtedly suggest means for enhancing the usefulness of the book to its readers. The YEAR BOOK for 1901, while not departing from the plan of its predecessors in essentials, has aimed at a greater degree of condensation, and to this end has altered somewhat the method of treatment in the articles on the States of the United States. Certain classes of statistical matter formerly given under the separate States have been tabulated under general heads. Thus, instead of including in every article on a State a separate paragraph on Educational Statistics, the figures are given in consolidated tables under the following heads: EDUCATION IN THE UNITED STATES; SCHOOLS; NORMAL SCHOOLS; PROFESSIONAL SCHOOLS; and UNIVERSITIES AND COLLEGES. This method admits of the introduction of more general discussion pertaining to the subject as a whole, and offers a means of comparison. Again, the statistics of the Crops will be found in the articles on the crops themselves (BARLEY; CORN; WHEAT, etc.), which sum up the yield by States so far as the figures are available. And the same rule applies to Banking Statistics, which will be found in the articles BANKING; STATE BANKS; PRIVATE BANKS; NATIONAL BANKS; SAVINGS BANKS, and TRUST AND LOAN COMPANIES; to RAILWAYS, and to the principal minerals (COAL, COPPER, IRON, etc.). The space thus gained has made it possible to include in the articles on States an account of the progress of Industries, based on the Census Reports on Manufactures, most of which were published in 1901, and to notice the great body of State Legislation. Since most of the State legislatures meet in the odd-numbered years, the latter subject has necessarily received more extended treatment than in 1900.

In the political history of the year, the matters of most interest to Americans are naturally those which have to do with the pacification and government of the new possessions of the UNITED STATES. Chief of these was the decision of the Supreme Court in the insular cases. Next in importance were the beginnings of civil government in the PHILIPPINES, the adoption of a constitution for CUBA, and the progress of PORTO RICO under her new government. The industrial record was remarkable for the formation of the largest trust of modern times, the UNITED STATES STEEL CORPORATION; for one of the largest STRIKES of recent years, the Steel Strike; and for the taking of an important step toward the ARBITRATION of labor disputes by the formation of the National Civic Federation. The financial record, instead of being scattered under different heads, is in this volume comprised in a single article, the FINANCIAL REVIEW OF THE YEAR. Among the important topics in foreign affairs are the advance of RUSSIA in Manchuria, PERSIA, SERBIA, and the BALKAN PENINSULA; the discussion of GERMANY's new tariff measure; the passage of the Associations Bill in FRANCE; the settlement of the indemnity question in CHINA; and the continued war in the TRANSVAAL. In GERMANY the results of the 1900 census became available during the year, and in FRANCE and GREAT BRITAIN the census returns for

1901 were published. In AUSTRIA-HUNGARY the Reichsrath for the first time in years enjoyed a period of orderly procedure, compressing in that interval much important legislation. The legislative record for AUSTRALIA and the Australian states during the first year under the federal constitution has an especial interest. In the department of biography the death roll includes the names of QUEEN VICTORIA, MCKINLEY, HARRISON, LI HUNG CHANG, VERDI, CRISPI, ROWLAND, FISKE, etc. Some of the features of the scientific record are: The progress in AERIAL NAVIGATION; Loeb's and Mathews's experiments in PHYSIOLOGICAL CHEMISTRY; Marconi's successful application of WIRELESS TELEGRAPHY; in PHYSICS, the foundation of the Bureau of Standards at Washington to serve as a national physical laboratory; in ASTRONOMY, the discovery of a new star in Perseus; in MEDICINE, the continued progress of SERUM THERAPY; in MAMMALOGY, the discovery of a new species of mammal, the Okapi; in PSYCHICAL RESEARCH, the renewed interest in the famous Piper case. Interest in ARCTIC EXPLORATION was sustained by Peary's report of a nearer approach to the Pole, and by the departure of the magnificently equipped Baldwin-Ziegler Expedition; and in ANTARCTIC EXPLORATION the operations of the year were the most important that have been undertaken for more than half a century. In the literary record of the year an attempt has been made, not only to describe briefly the principal books, but to reflect so far as possible the current discussion of their qualities. Thus, the article on LITERATURE, AMERICAN AND ENGLISH, avoiding on the one hand the character of a mere catalogue, and on the other that of an essay on a few selected books, presents a running commentary on a large number of the most important books of the year. The addition to the staff of contributors of a government official and authority on agricultural matters has made it possible to present in the articles AGRICULTURE, HORTICULTURE, and DAIRYING, as well as in the separate articles on the crops, an adequate treatment of the scientific and practical progress of the year.

The International Year Book 1901

ABBEY, EDWIN AUSTIN, the American artist, was commissioned in 1901 to paint the coronation scene at the crowning of King Edward VII. in 1902, and also finished his important series "The Quest of the Holy Grail," for the Boston Public Library, during the year. He was born in Philadelphia, April 1, 1852, and received his art education at the Pennsylvania Academy of Fine Arts. In 1871 he was engaged by Harper and Brothers as a staff artist, and in 1878 was sent by them to England, where he has lived almost continuously since. The first of his pictures to be exhibited at the Royal Academy was "A May Day Morning" (1890). Others of his notable works are "Fiametta's Song" (1894); the first part of the series of decorative panels for the Boston Library (1895); "Richard III. and the Lady Anne" (1896); "Hamlet" (1897); and "King Lear's Daughters" (1898). Besides these he has illustrated editions of *Herrick's Poems*, *She Stoops to Conquer*, the *Comedies of Shakespeare*, and other works. Mr. Abbey's work is characterized by its decorative quality, as well as by a graceful and romantic conception, especially in the illustration of Shakespeare and Goldsmith.

ABBOTT, EVELYN, English scholar and teacher, died at Malvern, England, September 7, 1901. He was born in England in 1843, and was educated at Balliol College, Oxford, where he graduated in 1866. He was elected a fellow of Balliol College in 1874, and subsequently became tutor and librarian, filling the office of classical moderator in 1883, and again in 1893-94. Mr. Abbott was extremely popular as a tutor and lecturer, and he gained a large influence over his students by his sympathy and interest in their work. He wrote much, principally on Greek philology and history. Among his works are, *Elements of Greek Accidence* (1874); *Index to Plato* (1875); *Hellenica: Essays on Greek Poetry, Philosophy, History and Religion* (1880); *A History of Greece* (1888); and a translation of Max Duncker's *History of Antiquity* (1887-91).

ABDURRAHMAN, or **ABDUL-RAHMAN**, Ameer of Afghanistan, died at Kabul, October 3, 1901. Eldest son of Afzul Khan and nephew of the late Ameer Shere Ali, he was born about 1830, and received a thorough economic and political training. In the civil war of 1864 he played a conspicuous part in his father's struggle to wrest the control of the country from Shere Ali, being in fact the organizer and director of these campaigns. Afzul Khan was placed on the throne in 1867, but proved incompetent and died from the effects of dissipation a year later, whereupon Shere Ali regained control of the government and Abdurrahman fled to Russia where he lived in seclusion. In 1879 Shere Ali died and was succeeded by his son Yakoub Khan, who was driven out by the British after a reign of less than a year, in punishment for the assassination of British envoys to his court. Seizing the opportunity thus afforded, Abdurrahman returned from retirement, and because of assistance rendered to the British and the eagerness of the latter to concern themselves only with affairs in India at that time, was recognized as Ameer by Great Britain and shortly afterward gained the submission of his subjects. Throughout his reign Abdurrahman governed with unusual vigor and wisdom, nominally under the control of the British government, but actually retaining considerable independence. He was a vigorous political organizer, and enforced with a strong hand the laws for punishing illicit traders and gamblers. He reorganized the army, crushed out revolts against his power with unsparing severity, and by his efforts raised the social, industrial, and

agricultural welfare of the country to the greatest excellence it has ever known. He was succeeded by his son, Habibullah (*q.v.*).

ABRASIVES. The production of natural abrasives in the United States in 1899 and 1900 was as follows:

Material.	1899.	1900.
Oilstones, whetstones, etc.....	\$208,283	\$174,087
Grindstones	675,586	710,026
Buhrstones	28,115	32,858
Infusorial earth.....	25,302	24,270
Crystallized quartz.....	39,000	40,705
Garnet	98,325	123,475
Corundum and emery.....	150,600	102,715
Totals.....	\$1,225,211	\$1,205,073

Of the artificial abrasives, the value of the crushed steel produced for this purpose in 1900 was \$47,250. The quantity of carborundum produced in 1900 was 2,401,000 pounds, the value of which is not given. The imports of grindstones in 1900 were valued at \$92,581, while those of oilstones and whetstones amounted to \$39,306, and of buhrstones to \$28,904. Attempts are being made to find good stones for grinding wood pulp in the United States, and for this purpose the Peninsula and Tippecanoe grits of Ohio sandstone are being used. Pulp stones are broader than grindstones, and those now in use have been imported from Newcastle-on-Tyne, England. The imports of these stones in 1900 amounted to 553 tons, an amount which was probably exceeded in 1901. Among the recent publications dealing with abrasives is one by J. H. Pratt on the abrasive materials of the United States, *Mining and Metallurgy*, xxiv, p. 347, 1901.

ABYSSINIA, an independent country of eastern Africa, separated from the sea by Eritrea and French, British and Italian Somaliland. The capital is Adis Ababa.

Area and Population.—Abyssinia proper consists of four provinces, Tigré, Shoa, Amhara, and Godjam, the combined area of which is estimated at 100,000 square miles; dependent territories aggregate some 50,000 square miles. Both of these estimates are perhaps too small. It was reported in the fall of 1901 that the boundaries between Abyssinia and the Egyptian Soudan had been fixed; the only Abyssinian frontiers remaining undetermined were in the region of Lake Rudolf and the Juba valley; and in November it was stated that the British government had despatched engineers to survey a proposed boundary in these districts. The population is estimated at about 3,500,000. There are few towns of more than 5,000 inhabitants; Harar, however, has a population of about 35,000. The state religion is Christianity. Education, which is in the hands of the clergy, is not in an advanced condition.

Government, etc.—In 1889 the King of Shoa became the ruler of all Abyssinia under the title of Emperor Menelek II. He is practically an absolute monarch, but maintains a sort of feudal political system with the *rases*, or princes, under whom are governors of districts and chiefs of villages. The most important *rases* constitute a state council. Besides territorial troops and irregulars there is an army of 150,000 men made up of contingents from the several provinces.

Industries, Commerce, etc.—To a small extent the inhabitants engage in agriculture, but the raising of cattle and sheep is the principal industry. The imports consist chiefly of cotton and woollen goods, cutlery, glassware, matches, provisions, and arms. In the fiscal year 1900 the imports and exports at Harar, the commercial centre of the country, were estimated at 3,822,650 dollars and 2,691,000 dollars respectively. (The Abyssinian silver dollar is worth about fifty cents in United States money.) Customs duties are imposed on both imports and exports.

A railway from Jibouti, on the coast in French Somaliland, to Harar, 186 miles distant, is under construction; the line has entered Abyssinian territory, and on December 17, 1901, was completed to the 125th mile. In 1901 a telegraph line was projected between Massowah, on the coast of Eritrea, and Adis Ababa, and a tramway between the latter town and Adis Halem.

Foreign Influence.—For some time it has been felt that Franco-Russian influence is in the ascendancy in Abyssinia. Several years ago King Menelek appointed the Russian adventurer, Count Leontieff, and a French prince governors of his equatorial province. This appointment, according to a report published in April, 1901, had been reaffirmed, as far as M. Leontieff was concerned, who after an absence from Abyssinia was returning thither to take command of the forces to be raised in the equatorial province. Gold was recently discovered in that province, and in June, 1901, an associate of Leontieff's, Baron de Chedeuvre, sailed from France with a number of engineers to explore the fields. On the other hand British influence

seemed to be on the increase in 1901. It was reported that several English companies had arranged to provide funds for a railway to connect Adis Ababa with the coast. For the military alliance, which is more significant, between British and Abyssinian troops, and the operations in the field, see **SOMALILAND**.

ACADEMIE FRANCAISE, founded in 1635 by Cardinal Richelieu and reorganized in 1816, is the first and most eminent of the academies forming the Institute of France (*q.v.*). It is composed of forty members (known as the "forty immortals") who are elected for life, after personal application and the submission of their names to the head of the state. The members receive an annual stipend of 1,500 francs, the permanent secretary 6,000 francs, and 6 members on the dictionary committee receive each annually besides 1,000 francs for their work. The Académie has also the disposal of a prize of 12,000 francs annually, alternately for poetry and eloquence, besides a number of smaller prizes. The chief office is that of the permanent secretary; the present incumbent is Marie Louis Antoine Gaston Boissier, who was elected to the Académie in 1876 and has a life tenure of his position. The Académie meets twice a week at the Palace Mazarin, 23 Quai Conti, Paris. Two members were elected in 1901, viz.: Charles Jean Melchior, Marquis de Vogüé, to succeed the Duc de Broglie, and M. Edmond Rostand to succeed M. Bornier. A chair in the Académie is the ambition of the literary men of Paris.

ACADEMY OF MEDICINE, AMERICAN, founded partly with the object of encouraging intending physicians to pursue a regular course of study leading to a bachelor degree before entering on the study of medicine and partly for the investigation of various problems of medical sociology. Membership, honorary and active, 634. President, Victor C. Vaughan, University of Michigan; secretary and treasurer, Charles McIntire, M.D., Easton, Pa.

ACADEMY OF POLITICAL AND SOCIAL SCIENCE, AMERICAN.
See **POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF**.

ACETOSPYRIN is a new salicylic compound which, unlike other salicylates, is insoluble in the gastric juice, but readily soluble in the intestinal secretions. It is a combination of aspirin (aceto-salicylic acid) with antipyrin, and occurs as a white, crystalline powder, with a slight acetic odor, and is almost insoluble in cold water. It has been used by Winterberg in the General Hospital in Vienna with great success in cases of rheumatism.

ACTINOTHERAPY. See **PHOTOTHERAPY**.

ADAMS, HERBERT BAXTER, American educator and historian, died at Amherst, Mass., July 30, 1901. He was born at Shutesbury, Mass., April 16, 1850, graduated at Amherst College in 1872, and received the degree of Ph.D. at Heidelberg in 1876. Upon his return from Germany he became a fellow (1876) at the newly established Johns Hopkins University, and in a few years assumed charge of the departments of history and political science, a position he held until failing health compelled his resignation a few months before his death. From 1884, the year of its organization, Professor Adams was secretary of the American Historical Association, in the foundation of which he took a leading part. Early in his university career he founded the *Johns Hopkins University Studies in Historical and Political Science*, and edited, with fine judgment, some forty volumes in the series. From 1887 he edited the series of *Contributions to American Educational History*, published by the United States Bureau of Education, and was also a contributor to it. The *Life and Writings of Jared Sparks* (1893) was his only published book, but among his many important monographs may be mentioned *The Germanic Origin of the New England Towns*; and *Thomas Jefferson and the University of Virginia*.

ADEN, a territory in southwestern Arabia about 100 miles east of Bab-el-Mandeb. The total area, including the small island of Perim, is 80 square miles; the population (1891), 41,910. Aden is a dependency of the Bombay Presidency and is administered by a British political resident, who is commander of the troops; it is a point of British protection over the neighboring Arab tribes which are independent of Turkish rule. Aden is an invaluable British possession, since it affords an important coaling station and practically commands the entrance to the Red Sea, thus protecting the trade with India. The commerce is almost entirely in transit. Imports and exports in the fiscal year 1899 amounted to 41,694,011 rupees and 33,289,895 rupees respectively; in 1900, 43,264,556 rupees and 35,244,515 rupees respectively.

On July 14, 1901, an expedition numbering about 500 British and Indian troops under Colonel Harrison left the port of Aden for Al Dareja, about seventy miles inland, to destroy a fort built by Turks under Mahomed Nussar in the territory of the Haushadi, who are under British protection. Although the Porte disowned the act of the Turks, the Haushadi were unable to obtain possession of the fort, and

hence the Indian government interfered. After overcoming some opposition the British force destroyed the fort in the latter part of the month. It was announced in November, 1901, that Great Britain had accepted in principle the proposal of the Porte for the appointment of a mixed Anglo-Turkish commission to mark the boundary between the hinterland of Aden and the vilayet of Yemen.

ADRENALIN is the name given to the active principle of the suprarenal gland by Takamine, of New York, who isolated the new drug in 1900. It is claimed to be the most powerful astringent and hemostatic known. One drop of a solution of Adrenalin in water, of the strength of 1 to 10,000, will blanch the normal conjunctiva in from one-half to one minute. Takamine states that the intravenous injection of 0.000016 gramme of Adrenalin chloride in a dog weighing 30 pounds raised the blood pressure to nearly nine millimeters of mercury. It is thus 625 times stronger than suprarenal extract. It is not irritating, poisonous, cumulative, or injurious. It has a wide range of applicability in treatment of the eye and of the nose, and has already proved useful administered internally in asthma, laryngitis, Addison's disease, exophthalmic goitre, and in certain heart diseases. Reichert, of Philadelphia, has experimented successfully with Adrenalin in opium and morphine poisoning, in collapse during anæsthesia, and in allied conditions where circulatory failure exists. He finds that it has prompt and positive action upon the respiratory movement of the heart, the arterial pressure, general metabolism, and the body temperature. Adrenalin is described as a light, white crystalline substance, with a slightly bitter taste and a numbing influence on the tongue; stable when dry; slightly soluble in cold water, though readily soluble in hot, and with a faint alkaline reaction. See SUPRARENAL EXTRACT.

ADULTERATION. See FOOD.

ADVANCEMENT OF SCIENCE, AMERICAN ASSOCIATION FOR THE, was organized in 1848 and has a membership of over 3,000, including some of the best known scientific men in the country. About fifteen leading scientific associations are affiliated with the association, which serves as a centre for the meetings of these societies. The association meets in sections which cover the field of science. These are: (a) Mathematics and Astronomy; (b) Physics; (c) Chemistry; (d) Mechanical Science and Engineering; (e) Geology and Geography; (f) Zoology; (g) Botany; (h) Anthropology; (i) Social and Economic Science; (k) Physiology and Experimental Medicine. The annual meetings of the association are held each time in a different city, the last six meetings having been held at Buffalo, Detroit, Boston, Columbus, New York, and Denver. The next meeting will be held June 28-July 3, 1902, at Pittsburg, Pa., at which Professor Asaph Hall, Cambridge, Mass., will preside. At the New York meeting, by unanimous vote of the council, it was decided to send *Science*, a scientific journal of 2,000 pages, free to members beginning January, 1901. The Association for the Advancement of Science held its fiftieth annual meeting at Denver, Colo., during the week commencing August 24, 1901, under the presidency of Professor Charles S. Minot, of Harvard University. This was the first meeting held west of the Mississippi River, and was well attended. There were ten sections represented and two hundred and twenty papers read at the meeting. The address of the retiring president, Professor R. S. Woodward, of Colorado University, was mainly devoted to the consideration of *The Progress of Science*. Professor C. R. Van Hise read a paper on *The Geology of Ore Deposits* and Mr. Gifford Pinchot, chief of the Bureau of Forestry, on *Irrigation and Forestration*. In the section of Chemistry, Professor J. H. Long, of Northwestern University, delivered an address on the development of the teaching of chemistry in the United States. In the section of Mechanical Science and Engineering, John H. Brashear, acting chancellor of Western University, of Pennsylvania, described plans drawn for the Carnegie Technical College in Pittsburg, which will call for an endowment of from \$10,000,000 to \$20,000,000. In the section of Zoology, Professor Charles B. Davenport, of the University of Chicago, discussed the quantitative study of variation, and in the section of Anthropology, Amos W. Butler, of the Indiana State board of charities, described the methods applied under his direction to the care of the feeble-minded, with some scientific deductions on heredity. In the section of Social and Economical Science, Professor C. M. Woodward, of Washington University, St. Louis, read a paper on *A Change of Front in Education*. A new section of the Association devoted to physiology and experimental medicine was organized, and will hold its first meeting for the reading of papers in 1902. President, Professor Charles S. Minot, Harvard University; permanent secretary, L. O. Howard, Washington, D. C. See ZOOLOGICAL SOCIETIES.

ADVANCEMENT OF SCIENCE, BRITISH ASSOCIATION FOR THE.
See BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE and ZOOLOGICAL SOCIETIES.

ADVANCEMENT OF SCIENCE, FRENCH AND SOUTH AFRICAN ASSOCIATIONS FOR THE. See ZOOLOGICAL SOCIETIES.

ADVENTISTS, popularly known also as Millerites, a name derived from that of their founder, have, according to late statistics, 88,705 communicants, 1,505 ministers, and 2,286 churches included in the following six branches: Evangelical, Advent Christians, Seventh Day Adventists, Church of God, Life and Advent Union, and Church of God in Jesus Christ. In numerical strength the Advent Christians, with over 25,000 members, rank next to the Seventh Day Adventists.

Seventh Day Adventists, organized in 1844, have a membership of 75,767 (nearly 60,000 in the United States), with 510 ministers, and 1,892 churches. This body, whose headquarters are at Battle Creek, Mich., maintains 5 colleges, 12 academies and industrial schools, and 10 publishing houses. There are 45 or more conferences throughout the world, and the missionary work, carried on in some 40 fields, covers an extensive territory. A system of parochial schools has been projected in the interests of which an educational conference and summer school was convened at Lake Gognac, near Battle Creek. During the first six months of 1902, four important union conferences will be held in various parts of the United States, and later the General European Conference will meet in London, England.

AERIAL NAVIGATION. Renewed attention was called to the problem of aerial navigation during 1901 by the experiments made with a dirigible balloon by M. Santos-Dumont, a young Brazilian, resident in Paris. Indeed it was publicly proclaimed by the French newspapers, because of these experiments, that a final solution of this fascinating problem had been devised. This claim certainly cannot be allowed, and it is not at all plain to experts in aeronautics from the facts so far made public that M. Santos-Dumont has established a right even to the claim of having advanced the dirigible balloon to greater perfection as a device for navigating the air than it already possessed. A brief summary of previous experiments with dirigible balloons will present some exact facts with which to compare the results obtained by this latest experimenter. The evolution of the dirigible balloon began in 1852, when Gifford ascended in one 144 feet long, equipped with a 3 horse-power steam engine weighing 462 pounds, and attained an independent speed of 6.71 miles an hour. In 1872 Dupuy de Lôme ascended in a balloon 118 feet long and attained a speed of 6.26 miles an hour, with man power. In 1884 Tissandier attained a speed of 7.82 miles an hour in a balloon 92 feet long equipped with an electric motor of 1½ horse-power, weighing 616 pounds. A year later, in 1885, Renard and Krebs, using the balloon *La France*, 165 feet long, provided with a 6 horse-power electric motor, is said to have attained for an instant a speed of 17 miles an hour. The last Schwartz, with a balloon 157 feet long equipped with a 16 horse-power benzine motor is said to have attained for an instant a speed of 17 miles an hour. The last of the experiments to be noted before coming to those of M. Santos-Dumont is that of Count Zeppelin, made in 1900, with a balloon 480 feet long and 39 feet in diameter, provided with two benzine motors of 32 horse-power, and weighing 1,430 pounds. With this balloon, its designer attained a maximum speed of 18 miles an hour. Both Renard and Krebs and Count Zeppelin were able with their machines not only to maintain the independent speeds in direct flight which have been stated, but also to beat against the wind and to turn at will and describe loops and circles in the air. Turning now to the experiments of M. Santos-Dumont, it may be stated at the outset that the work which culminated in the notable flight of 6½ miles around the Eiffel Tower in 1901 was begun in 1898. The first balloon, which was built in 1898, was in the form of a cylinder terminated at each end by a cone; it was 82 feet long, nearly 6 feet in diameter, and could lift 450 pounds, including its own weight of 66 pounds, or about 380 pounds net load. Beneath the balloon was suspended a light basket containing the propelling machinery and accommodations for the aeronaut. The motor was of 1½ horse-power, operated by gasoline. To trim the balloon fore and aft so as to ascend and descend a bag of ballast was attached to a rope hung from the fore part or the after part, tilting the balloon up or down as desired. The first serious attempt at flight with this machine came near being fatal to the aeronaut. To compensate for the condensation and dilatation of the gas in the balloon by changes of temperature, the inventor had placed a small compensating air balloon inside the gas balloon, which by means of an air pump could be inflated and deflated at will. In the first flight the air pump failed to work, and the gas balloon became flabby through condensation and began to double on itself and finally fell. Through sheer good luck no damage resulted to the aeronaut. Previous to the accident the operator had thorough control of his machine and was able to manœuvre it in circles and loops at will. The second balloon built by M. Santos-Dumont was similar in construction to the first, but was somewhat larger. No ascension was made with this balloon, as the inventor had come to the conclusion that a change in model was desirable. Balloon No. 3 was accordingly constructed in 1899,

with a length of 66 feet and a diameter, at its greatest section, of $11\frac{1}{2}$ feet. In it illuminating gas took the place of hydrogen, and the compensating air balloon was omitted altogether. As a precaution against the balloon doubling on itself, a 30-foot bamboo pole was fixed lengthwise to the suspension cords above the car and beneath the balloon. The first trip made with this balloon is thus described by the inventor in an interview published in the *Century Magazine*: "On November 13, 1899, I started from Lachambre's atelier in Vaugirard with the No. 3 on the most successful trip I had yet made. From Vaugirard I went directly to the Champ de Mars, over which I practised describing figure 8's. The air-ship obeyed the rudder beautifully. After circling round the Eiffel Tower a number of times, I made a straight course to the Parc des Princes at Auteuil; then, making a hook, I navigated to the manœuvre-grounds of Bagatelle, where I landed." In this balloon the motor proved too weak, and the whole machine was found to be clumsy. Balloon No. 4 was built in 1900. It was 95 feet long and 9 feet in its greatest diameter. In place of the bamboo stiffening pole of No. 3, the inventor substituted a long, slender framework to which the propelling and controlling machinery was attached and on which the operator sat in a seat like a bicycle saddle, there being no basket. The motor used was a $7\frac{1}{2}$ horse-power petroleum engine. Numerous trips were made with this balloon during the Paris Exposition period of 1900. The fifth balloon of M. Santos-Dumont was constructed by adding a section to the middle of No. 4 so as to increase its length to 109 feet. The stiffening frame or "keel" was a carefully designed framework of wood and metal and was 60 feet long. Into this "keel," 20 feet from the stern, was fixed a 16 horse-power petroleum motor, connecting it with the propeller by a long, hollow steel shaft. The operator's basket or car was located 23 feet from the front or stern of the "keel," and from it cords led to the various operating devices. The most important trip undertaken with this balloon was made on August 8, 1901, in competition for the Deutsch prize of 100,000 francs to be awarded to the first dirigible balloon or air-ship that, between May 1 and October 1, 1900, 1901, 1902, 1903, and 1904 shall rise from the Parc d'Aerostation of the Aero Club at St. Cloud, and without touching ground, and by its own self-contained means describe a closed circle around the Eiffel Tower and return to its starting point in 8 minutes 50 seconds, turned in 40 seconds, and was on his way to the starting point when the balloon became deflated and fell onto the roof of the Trocadero Hotel in such a way that the "keel" remained suspended and preserved the life of its occupant. A previous trial trip made with the balloon on July 12 is described as follows in *Engineering News* of July 18, 1901: "The balloon was steered from St. Cloud to the Longchamps race-course; this course was circled six times at an average speed of 25 miles per hour, and the machine was made to descend to the ground and rise again. The operator then started for the Eiffel Tower and owing to some slight accident he descended easily in the Trocadero Gardens and repaired damages. He then rose again, made a complete circuit of the tower and returned to Longchamps. Including stoppages, the voyage lasted 66 minutes. M. Santos-Dumont uses no ballast and yet easily maintained his altitude of from 100 to 270 meters." On July 13, the trip of the preceding day around the tower was repeated, the distance of seven miles from St. Cloud to the town and back, being covered in 39 minutes. To take the place of balloon No. 5, which was destroyed on August 8, 1901, M. Santos-Dumont built a longer and thicker balloon, the sixth one constructed by him. On October 19, 1901, the inventor undertook to win the Deutsch prize with this balloon. The results of this trip were described as follows in *Engineering News* of October 20, 1901: "The dirigible balloon constructed by Santos-Dumont succeeded on October 19 in making a trip from St. Cloud to and around the Eiffel Tower, and then back to the starting point in 30 minutes 40 $\frac{1}{4}$ seconds. The first part of the trip to the tower was with the wind, and was made in 8 minutes 45 seconds, but the return trip was against the wind and required 20 minutes 30 seconds to complete. The remaining 1 minute 40 $\frac{1}{4}$ seconds was consumed in descending. The trip was undertaken as the result of a prize of 100,000 francs offered the inventor should he succeed in making the journey in 30 minutes. According to the press despatches, the balloon pitched somewhat when going against the wind, and Santos-Dumont, when he descended, said the motor suddenly stopped while the balloon was at a little distance from the tower. He thought he might have to descend, but luckily he succeeded in getting the machine started again. From that time on the motor worked satisfactorily." To sum up briefly the experiments of M. Santos-Dumont, the following conclusions seem to cover all that has actually been accomplished: Several balloons have been built with which the inventor was able to ascend and descend and to turn around a fixed point at will; in all but a few trips some accident has occurred to the whole or a part of the balloon; of the two trips (July 13 and October 19) around the Eiffel Tower, which were accurately timed, the journey of seven miles was made once in 39 minutes and once in 30 minutes 40 $\frac{1}{4}$ seconds. These facts are truly notable, but it should not be

FLYING MACHINES.—Santos-Dumont, French (upper). Kress, Australian (lower)

forgotten that the dirigible balloons of Renard and Krebs in 1884, and of Zeppelin in 1900 accomplished practically the same results. In 1901 M. Deutsch began the construction of a dirigible balloon to be operated by a motor of 60 horse-power, by far the most powerful engine that has as yet been actually planned for a flying machine of any sort.

AFGHANISTAN. A monarchy lying east of Persia, between Russian Turkistan and British India. The capital is Kabul.

Area and Population.—The total area of the four provinces, Kabul, Herat, Turkistan, and Kandahar, and the Badakshan district, comprising Afghanistan, is something over 215,000 square miles, and the population about 4,000,000. The inhabitants do not form a homogeneous nationality, but comprise several races or tribes; most of these, however, are united in religion—that of the Suni sect of the Mohammedans.

Government, etc.—Government is directed by the Ameer, whose will theoretically is absolute. From 1880 to 1901 the Ameer was Abdurrahman (*q.v.*), grandson of Dost Mohammed, the founder of the present dynasty. Abdurrahman died October 3, 1901, and was succeeded by his eldest son, Habibullah Khan. Afghanistan is practically under British influence; it has no foreign relations except with the government of British India, maintaining a political agent at Calcutta and accrediting a British resident (who must be a Mohammedan) at Kabul. The provinces are administered by governors. Extortion and dishonesty prevail in the collection of taxes; the amount of the annual public revenue is unknown. The ameer receives from the Indian government an annual subsidy of 18 lakhs of rupees (£120,000). The strength of the army is estimated at 44,000 men; the late ameer declared that at any time he could put into the field 100,000 trained soldiers. The military equipment, which is ample and of good quality, is supplied by the factories established by Abdurrahman at Kabul.

Industries and Commerce.—The inhabitants give considerable attention to agriculture, raising cereals, lentils, fruits, etc. Various minerals occur but are little developed. Manufactures include silks, carpets, and articles made of camels' and goats' hair. Statistics of commerce are not available, but the total annual trade with India is estimated at £800,000. The leading imports include cotton goods, dyeing materials, sugar, and tea; the exports: asafoetida, grain, horses, wool, silk, cattle, and hides.

History.—Abdurrahman's death, though reported on October 3, 1901, is said to have occurred two days earlier and been concealed by his successor to insure a peaceful accession to the throne. Habibullah Khan, "the Beloved of God," chosen by the late ameer, succeeded him, apparently without opposition from his brothers, and was favorably received by the people. The new ameer did not come into power without knowledge of rule; for several years he had been intrusted with the administration of important state affairs, and early in 1901 his duties were increased. His father, who practically made Afghanistan what it is to-day—a country of definite boundaries with a comparatively strong central government and an army able to defend them—was more feared than loved by the people. The new ameer is a man of gentler disposition than his predecessor, and in spite of his assurance that he would follow in the latter's footsteps, it was expected that his rule would show more leniency and effect various reforms. Shortly after his coronation he raised the pay of the soldiers, released certain prisoners from the jails throughout the country, and promised a reduction of taxes. There were indications that he would attempt to revive the former flourishing trade with India, which Abdurrahman's fiscal policy had largely destroyed. Since Afghanistan is a buffer state between the British and Russian empires, it has a large political significance, and the Afghan succession was, before Abdurrahman's death, a subject of much concern. The belief has been common that Russia did not favor Habibullah, but that government gave no evidence of such feeling on his accession. The new ameer was born at Samarkand in 1872, his mother being the daughter of the Mir of Badakshan. He is allied, through his wives, with several of the important chiefs of Afghanistan.

In 1901 Mr. Frank A. Martin, engineer-in-chief for the Afghan government since 1895, was engaged in extensive engineering works; canals and other irrigation works were in process of construction near Kabul, and an important road was being built toward the Oxus. In that district, it was reported, Abdurrahman had been erecting a number of forts, "well equipped with the most modern appliances, including electric searchlights." At the same time it was stated that he had ordered several heavy Krupp guns, while a nearly maximum amount of work was being done in the Kabul workshops, the output including smokeless powder.

AFRICA. So large a part of Africa is not known sufficiently well to admit of even approximately accurate estimates of area and population that figures for the area of the continent as a whole and its total number of inhabitants are little better

than guesses. The estimates of the several divisions that on the whole appear to be most trustworthy show an aggregate area of about 11,604,000 square miles and a population of about 156,780,000.

Independent Africa comprises Morocco, in the northwestern corner of the continent, Abyssinia in the east, Liberia in the west, and the Congo State in the central equatorial region. The total area of these territories is placed at 1,344,000 square miles and the population 39,000,000. It should be noted that the Congo State, so far as native influence is concerned, cannot be regarded as really independent.

One of the distinctive features of the close of the nineteenth century was the partition of Africa among the European powers. British territory, that is, colonies, protectorates, etc., includes Gambia and Sierra Leone, on the Atlantic, Gold Coast, Lagos, and Nigeria on the Gulf of Guinea, a part of Somaliland on the Gulf of Aden, the immense region extending from the Cape of Good Hope to Lake Tanganyika, and the still larger region extending from Egypt (the 22d parallel) to Victoria Nyanza and the Indian Ocean. The total estimated area of these territories is about 3,031,000 square miles and the population about 52,647,800. Egypt also, with about 400,000 square miles and 9,734,000 inhabitants, is practically under British influence. During 1901 the policy of the British government toward its African colonies and protectorates was severely criticised. It was alleged that, after new territory had been placed under British supremacy and some form of administration instituted, little further attention was given thereto by the imperial government. Imperial subventions, when not evaded, were made as small as possible, and often paid in such small instalments that they fell far short of meeting the real needs of the dependencies. As results of this "unintelligent parsimony" there were cited such disasters as the mutiny of the unpaid Soudanese troops in Uganda, and numerous outrages necessitating punitive expeditions. When so serious a thing as mutiny occurs, the government is ready to expend any amount of money needed to set matters right again; then affairs, it is held, are allowed to slip back to the same old channels. Adverse criticism was made against a colonial office that allows its colonial administrators to remain almost alone among savage and hostile tribes. In commenting upon the frequent murders of such unprotected officials, a writer said: "At once there is a punitive expedition organized; valuable lives are lost; a couple of hundred thousand pounds are spent; the natives are 'punished,' and the supplementary estimate necessitated by the 'little war' is made the excuse for exercising a still more rigid economy than the ordinary estimates for the protectorate." The *London Times* said editorially: "A penny-wise and pound-foolish policy is tolerated in the management of the greatest machine of government that the world has ever seen."

British efforts in African colonization, however, are distinctively more successful than French and German. French Africa extends from Algeria and Tunis southward, touching at various points the Atlantic and the Gulf of Guinea north of the equator and the Atlantic again south of the equator. In addition, France holds a small part of Somaliland. The total estimated area is about 3,326,000 square miles and the population about 32,682,000. In this territory French rule has been most successful in Algeria, which, it should be pointed out, is regarded administratively as an integral part of France.

German Africa includes Togoland on the Gulf of Guinea; Cameroon, extending from that body of water to Lake Tchad; German East Africa, lying between Lake Tanganyika and the Indian Ocean, and German Southwest Africa, bordering the south Atlantic. The total estimated area is 930,760 square miles and the population over 12,300,000. Thus far German colonial progress in Africa has been decidedly disappointing. The German population of these territories is surprisingly small, amounting to only a few thousands. The Germans seem to have a genius for commerce, but not for permanent settlement in new and undeveloped lands; and where German immigration is large, as in the United States, the newcomers readily lose political affiliations with the Fatherland. In addition to the inherent difficulty in the problem of German colonization, the projects of the Berlin government are further impeded, and seriously, by opposition in the *Reichstag*. This body refuses to vote the needed subsidies and guarantees for colonial works. This is conspicuously true with regard to the projected railways of German East Africa, the construction of which became in 1901 all the more important, from the German point of view, by the completion of the Uganda railway in British East Africa.

Portuguese territory includes the large colonies on the east and west coasts of southern Africa and the small colony of Portuguese Guinea bordering the north Atlantic. The total estimated area is about 790,000 square miles and the population 8,059,000. During 1901 fears were expressed in some quarters that the British advance in South Africa is destined to absorb, at least in part, the East African possessions of Portugal.

Italian Africa comprises Eritrea, on the Red Sea, and a portion of Somaliland, the extreme eastern part of the continent, the combined area of which is estimated

at 188,500 square miles and the population 950,000. Though Italy has been conspicuously unsuccessful in Africa colonization, she seems intent on further enterprise. It is certain that she covets Tripoli and Benghazi, which she hopes to transform into a kind of Italian Algeria. During 1901, and especially toward the close of the year, a Franco-Italian agreement was rumored, whereby French influence would dominate the Tripolitan hinterland and Italian rule would be instituted in Tripoli and Benghazi proper. This alleged agreement occasioned no little surprise, since the attitude of the Sultan of Turkey, in whose dominions the country is included, was apparently left out of the question.

Spanish Africa consists principally of Rio d'Oro, on the Atlantic south of Morocco, and a small district on the Gulf of Guinea. The area of the latter is stated at 1,000 square miles, and of the former 243,00 square miles. The actual area of Rio d'Oro, however, will doubtless prove to be much smaller when the boundary determined by the Franco-Spanish convention of 1900 is finally demarcated. The population of Spanish Africa is estimated at only a little over 100,000. See FERNANDO PO.

Turkish Africa comprises Egypt and Tripoli, including Benghazi. The total estimated area is about 799,000 square miles and the population upwards of 11,000,000. Though not nominally, Egypt is practically a British protectorate.

Events of 1901.—As in 1900 the most striking events in Africa in 1901 were connected with the Anglo-Boer war, which is treated in the article TRANSVAAL. But other military operations of more or less importance were carried on during the year. A punitive expedition on the part of the British, who were for a time assisted by French troops, was carried out in Gambia. British punitive expeditions also took place in both Northern and Southern Nigeria, in British East Africa, and in Somaliland, where a joint Anglo-Abyssinian campaign was carried on against the "Mad Mullah." In the French Soudan the French suppressed the uprising of an Arab tribe near Lake Tchad and defeated the remnant of Rabah's forces. In the Ogowe region of French Congo, a revolt of some 18,000 Pahuins took place, and in Wadai a rebellion broke out resulting in the assassination of the native sultan of that state. Uprisings occurred in the Congo Free State, in Algeria, and in Morocco.

A considerable number of exploring and surveying parties were at work in 1901. More accurate surveys, even in the better known parts of Africa, are a recognized need. During 1901 the region between the Sobat and Lake Rudolf was explored by Majors Austin, Bright, and Garner. The expedition, which proceeded across British East Africa, reaching Mombasa in September, suffered severely from the want of water and supplies. The frontier of the Egyptian Soudan was surveyed by Major Gwynn. In the Galla region south of Abyssinia work was carried on by Baron von Erlanger and Herr Oskar Neumann, who have added considerably to the geographical knowledge of that part of Africa. Corrective surveys of Victoria Nyanza have been made, and in Uganda Sir Harry H. Johnston made a number of journeys which resulted in important zoological discoveries (see MAMMALOGY). A German-Belgian expedition conducted surveys in the region of Lake Kivu, and districts further to the west were explored by Commanders Siffer and Sillye. Explorations were also carried on in West Africa; MM. Huot and Bernard were at work in northeastern French Congo and M. Lesieur nearer the coast. In northern Cameroon expeditions were conducted by Captain Ramsay and Captain Schimmelpfennig, and in the southeastern part of the territory by Lieutenant von Stein. In southern Morocco there were expeditions under Professor Fischer and under Mr. Bishop, and in Tripoli under M. Malthuisieulx.

For details of the various parts of Africa, see the articles on the several countries; also CAPE-TO-CAIRO RAILWAY, and, for commerce with the United States, UNITED STATES (paragraph Commerce).

AGARDH, JACOB GEORG, Swedish botanist and for many years a professor in the University of Lund, died January 17, 1901. Professor Agardh was born at Lund in 1813, and was educated at the University in that town, where he became professor in 1874. He was one of the greatest phycologists, authorities on sea-weeds, the great work of his life being the *Species, Genera, et Ordines Algarum*, which, begun in 1848, was finished in 1876. He was also the author of *Till Algernes Systematik* (1872-1890), and numerous other valuable works dealing with sea-weeds.

AGASSIZ, ALEXANDER, the American scientist who was elected president of the National Academy of Sciences in 1901, was born at Neuchâtel, Switzerland, December 17, 1835, the son of Professor Louis Agassiz, the famous naturalist. Removing to the United States with his father in 1849, he graduated at Harvard in 1855, and at the Lawrence Scientific School two years later. As assistant on the Coast Survey he went to California in 1859, and in 1860 he was made an assistant in the Museum of Comparative Zoology at Cambridge, a position which he retained until 1865. Then he made a venture in coal mining in Pennsylvania, which led to his connection with the development of the Calumet and Hecla Copper Mines on Lake Superior, from which he gained a large fortune. The years from 1865 to 1869 he spent at the mines, and then devoted a year to studying the museums of Europe, returning to take the position of assistant curator of the museum at Cambridge, and upon the death of his father in 1873 he became curator. In 1885 he resigned this position on account of ill health, after valuable work in developing the museum, and retained only an unofficial connection with the institution. Mr. Agassiz has spent much time with the Coast Survey in deep-sea dredging, and has headed a number of scientific expeditions. Among his publications are *Marine Animals of Massachusetts Bay* (with Elizabeth Agassiz, 1871), *North American Acalephæ* (1865), *Revision of the Echini* (1872), *North American Starfishes* (1877), *Report on the Echini of the Challenger Expedition*, and numerous monographs on deep-sea fishes.

AGRICULTURE. The season of 1901 was an unusually prosperous one for agriculture, considered as a whole. The wheat crop was one of the very largest, if not the largest, which this country has produced, and the prices, which depend upon the world's supply, were good, so that the total value of the crop of this country is placed at \$150,000,000 above that of the preceding year. There was a falling off in the cotton crop in a number of States, which brought the total yield down considerably below the average. The oat crop was a fair one and has commanded high prices. The corn crop was the disaster of the year, owing to a severe drought during the early summer. The total yield is estimated at nearly or quite 700,000,000 bushels below the average. The potato crop was short, and making necessary an unusual importation. The high prices, however, made up for the deficit. The prices of farm crops in general were very good, owing in part to the shortage of corn, which increased the demand for all sorts of feed stuffs. The *American Agriculturist* estimates the total value of the farm crops at \$400,000,000 over that of the preceding year. The shortage of the corn crop forced the heavy marketing of stock from the drought districts, and the high prices have tempted many farmers to ship their stock. There was an active market for animals and animal products throughout the year at satisfactory prices.

Plant Production.—The progress in plant production has been chiefly along the lines of greater diversification, more intensive cultivation, and the improvement, introduction, and management of new crops, from which has resulted a remarkable advancement in agricultural industries. This has been promoted by the efforts of the national Department of Agriculture to seek out and introduce plants or varieties better adapted to the conditions of different sections of the country, and to build up new industries, and by the great activity that there has been in the scientific improvement of plants by breeding and selection. In the plant-breeding work which is carried on by the Department of Agriculture and a number of the agricultural experiment stations, the effort is either to improve the quality or productibility of the plant, or to produce a strain or variety more resistant to unfavorable environment conditions or serious insect ravages. A great deal has already been accomplished with wheat, corn, cotton, and other staple crops, and the work is expected to exert a profound influence on agriculture. The Illinois Station has improved the quality of corn and the Minnesota Station has given to that section several varieties of wheat and corn which are more productive than the common varieties and possess more desirable qualities. In Illinois and Iowa organizations have been formed among farmers, who, under the instruction of their experiment stations, are engaged in breeding corn, establishing distinct types, and growing seed corn in accordance with scientific principles.

The macaroni wheats which the Department of Agriculture has introduced and disseminated have been found well adapted to a wide extent of territory in the West and Northwest. In 1900, when other wheats were almost a complete failure in the Dakotas, the macaroni varieties produced a good yield and grain of excellent quality, and these results were confirmed during 1901.

The rice industry in Louisiana and Texas has developed very rapidly during the past few years, not less than \$20,000,000 being now invested in that industry. During the past two years there has been an increase in the rice production of nearly 75,000,000 pounds, which has been accompanied by a falling off in the importation of rice of nearly one half. The rice is there grown under irrigation, the water being

pumped from wells or streams for that purpose. It is believed that in a few years this country will not only cease to import rice, but will be exporting it.

Great interest has been aroused, especially in 1901, in the reclamation and improvement of the ranges of the West and in finding or breeding forage plants adapted to them. The great success which has attended the trial of smooth brome grass (*Bromus inermis*) has led to the planting of this on a large scale in certain sections. While this is partly due to the demand for seed, many farmers are planting tracts of 50 to 100 acres for the production of hay.

The growing of tea in South Carolina is a demonstrated success. About 4,500 pounds of high-grade tea were produced at Summerville, S. C., in the season of 1901, for all of which a ready market was found in the North. The labor conditions have been so far overcome that the profit on this crop averages from \$30 to \$40 an acre.

In connection with the various studies that have been continued on the sugar beet and its adaptation to different sections of the country, an extensive résumé has been made by the Department of Agriculture showing the influence of environment on the sugar content of the beet, especially the soil and seasonal influences which brings out a number of interesting points. Studies of the effect of environment on the gluten content of wheat have shown that even in the course of a single year the influence was so great as to cause a variation of 50 per cent. or more from the original gluten content, usually a decrease.

The growing of Sumatra tobacco under shade in the Connecticut Valley, which gave such favorable results in 1900, was continued on a larger scale in the following year, about forty acres being grown under proper supervision. The results were even more favorable than in 1900, and show conclusively that when properly managed a wrapper tobacco of high quality can be grown in this country at a good profit. About \$2 a pound was realized for the product at auction. A company has been organized which will plant 100 acres in 1902, and it is said that cloth has been contracted for to cover over 500 acres. In the curing of tobacco there has been great progress, coming from a better understanding of the nature of the fermentation and the conditions for the development of black rot and other unfavorable changes. Bulk fermentation has been shown to be very superior to the old method of fermenting in the case, both in improving the quality of the leaf and in controlling the dreaded black rot.

Soil Studies.—During 1901 a soil survey under the supervision of the Department of Agriculture was undertaken on an extensive scale. Beginnings have been made in a number of States, and the work will be vigorously prosecuted with a view to mapping the soil areas so as to show the different types of soils represented and to determining methods of soil management and cropping. A considerable amount of work has been done in studying the alkali of the West—the way in which it injures or prevents the growth of plants and the tolerance of different plants for it. The rôle of micro-organisms in the soil in rendering plant food available, decomposing organic matter, and nitrifying nitrogenous matter, is now better understood, and it is recognized that the real object of the cultivation of the soil is very largely the bringing about of conditions favorable to the activity of these beneficial organisms. These investigations have an exceedingly important bearing in shaping the practices of soil management.

The benefits of a rotation of crops in maintaining soil fertility, as compared with continuous wheat growing, have been forcibly brought home to the farmers of the Northwest during the past two seasons. The system of continuous wheat culture with summer fallow has been shown by Snyder at the Minnesota Experiment Station to result in heavy loss in nitrogen and humus, the loss of the latter changing the physical properties of the soil and causing it to be less retentive of moisture. Bare summer fallow, which is common in the wheat-growing regions of the Northwest, has been shown to cause a heavier loss in nitrogen than continuous wheat growing. A condition has been reached, both in the wheat lands of the North and the cotton fields of the South, where a system of rotation must be employed to secure good results. Experiments carried on for six years at the North Dakota Experiment Station show that continuous wheat culture is unprofitable, while wheat in rotation increases in yield and improves the fertility. Three crops of wheat and one of clover gave in four years almost as much wheat and more profitable returns than four successive crops of wheat. The results of the past two years have shown the marked advantage of rotation, and they are gradually having their effect in changing the practice and doing away with the wasteful summer fallow system.

Live Stock.—The census returns of the enumeration of farm animals, issued during 1901, show that the number of farm animals is increasing relatively more rapidly than the population, indicating an increased production of live stock in recent years. The effect of this has, however, not been apparent in the prices received. The prices of live stock in general have been good, and the report of the Union Stock Yards at Chicago shows the business of the past year to have been almost

unprecedented. The total number of cattle received at the yards, over 3,000,000 head, was larger than in any year since 1893. For the first time in the history of the yards the receipts of sheep and lambs reached the 4,000,000 mark, and the number of hogs exceeded 8,000,000. The stock received at the yards during the year represented an estimated value of nearly \$284,000,000, which was an increase of more than \$20,000,000 over 1900. There was a notable increase in the number of cattle and sheep exported from this country in 1901, the former being greater than in any year since 1898, and the latter the largest since 1896. The exports of animals and animal products during the year amounted to nearly \$254,000,000.

The discovery of a practicable method of immunizing northern cattle to Texas fever has led to the introduction of a large number of high-bred animals into the South for the improvement of the herds. In recent years a marked improvement has also taken place in the general character of the animals raised on the range, and in breeding beef animals to meet the demand. A notable instance of this improvement is found in the fact that at the Fat Stock Show at Chicago in December, 1901, the champion carload lot of fat steers were produced on a Texas ranch and were largely of Hereford blood. Another change in stock raising has come from the worn-out condition of the open range and the gradual selling and fencing in of the public domain. While there is much interest in the renovation and improvement of these ranges, time will be required to overcome the effects of the continued overstocking, and the changed conditions brought about afford encouragement for intelligent stock raising in the East. With the superior prices for high-grade beef, rapidly grown and of the type best suited to the butcher, the opportunity for profitable beef production in the East is believed to be good and the conditions more favorable to it than they have been for many years past.

The Russian government has taken steps in the direction of improving the character of the live stock and the live-stock industry of that country. An appropriation of \$2,000,000 was made in 1901 to begin this work, together with a regular appropriation for its continuance.

The exhibition event of the year was the Second International Live-Stock Exposition, held at Chicago early in December, which was one of the largest and most successful live-stock expositions ever held. Practically 12,000 animals competed for premiums amounting to \$110,000, and these were viewed by over 400,000 people. The exhibition animals included cattle, horses, sheep, and pigs. Among the beef cattle the Aberdeen Angus, which carried off the prizes last year, were this year outclassed by the Herefords. The grand champion of the show was a pedigreed Hereford steer, and the champion carload lot of steers, as mentioned above, was composed of grade Herefords. The latter brought at auction \$12 per hundred weight. The auction sales of breeding cattle brought some unusually high prices. A Shorthorn cow sold for \$6,000, a Hereford cow for \$4,500, a Galloway bull for \$2,000, and a Shorthorn bull out of the royal herd of England sold privately for the highest amount, it is stated, ever paid in America. A Berkshire boar sold privately at the remarkable price of \$2,500.

There has been renewed interest in the Angora goat, resulting in a considerable demand for this variety in those sections of the country which are suffering from the encroachment of brush and briars upon the farm and pasture lands. As the Angora produces annually a fleece worth from \$1.00 to 1.50, and its skin with the fleece attached is worth from \$1.50 to \$2.50, it would seem that Angora goat raising is likely to develop into a permanent industry in certain sections of this country.

The investigation in the line of animal production has continued along much the same lines as in previous years and has covered the whole range of commercial and home-grown feeding stuffs, the economical production of beef, mutton, and pork, using farm-grown feeds to a greater extent, and more intricate problems connected with the physiology of animal nutrition. In this connection it may be mentioned that a respiration calorimeter, which is the first apparatus of its kind for use with large animals, has been completed at the Pennsylvania Experiment Station, and experiments have been commenced with it in a preliminary way.

Literature.—Of the new literature of 1901, the following books may be mentioned: *Agriculture* (Volumes 1, 2, and 3), by William P. Brooks; *Agricultural Bacteriology*, by H. W. Conn; *Text-Book of the Physics of Agriculture*, by F. H. King; *Feeding of Animals*, by W. H. Jordan; *Judging Live Stock*, by John A. Craig; *Study of Breeds in America*, by Thomas Shaw; and *Breeds of Poultry*, by G. C. Watson.

UNITED STATES DEPARTMENT OF AGRICULTURE.

The great development of the administrative and scientific operations of the Department of Agriculture under the administration of Secretary James Wilson has necessitated its reorganization in accordance with the plan followed in the other departments of the National Government. Congress has therefore authorized the

establishment of four new bureaus: the Bureau of Plant Industry (comprising the former divisions of botany, vegetable physiology and pathology, agrostology, pomology, seeds, gardens and grounds, and the section of seed and plant introduction); and the Bureaus of Soils, Chemistry, and Forestry (taking the place of the former divisions of the same names).

The annual appropriation for the department for the fiscal year ending June 30, 1902, is \$3,862,420, exclusive of the regular appropriation of \$720,000 for the State agricultural experiment stations. The number of its paid employees is over 3,500, of whom more than 2,000 are engaged in operations connected with its scientific work. During the year 1901 it issued 606 publications, aggregating nearly 8,000,000 copies. The *Year Book* has an edition of 500,000 copies. Plans have been drawn for a new main building, provision for which is made in a bill now before Congress. Among the important advances in the work of the department during the past year are the following:

The Weather Bureau has established cooperation with Europe in the interchange of weather forecasts and has extended the distribution of forecasts to farmers through rural free delivery. Progress has been made in perfecting a system of wireless telegraphy for use in the weather service. Meat inspection is now maintained in fifty-one cities where nearly 37,000,000 animals were inspected in 1901. Investigations in plant breeding have been much extended and the problems of the improvement of the western ranges are being widely studied. Satisfactory results have been obtained in the growing of macaroni wheats, Egyptian cotton, the date palm, and tea. With the aid of the department, Sumatra tobacco is being successfully grown in the Connecticut Valley and Florida. The survey of soils of different States with reference to their agricultural capabilities has been greatly extended. Investigations on the adulteration of food products have been extended to include imported foods. The investigations on the nutrition of man include dietary, digestion, metabolism, and cooking experiments. The work in forestry has been enlarged to include the study of forests, forest fires, forest grazing, commercial trees, lumbering, and forest products for the Federal and State governments, and for private individuals. Expert assistance is being given in the management of forest reserves as well as of private forest lands. Much progress has been made in studies of the irrigation laws and institutions in the arid States and the distribution and use of water for different crops in both the arid and humid regions. The survey of the life zones and crop belts in the West has been continued in connection with which it has been ascertained that a species of agave grows in great abundance in Texas which may take the place of large quantities of fibre now imported, mostly from Mexico. The inspection of the importation of birds has been systematized under the provisions of the Lacey Act. The investigations which resulted in the introduction and establishment in California of the fig fertilizer insect (*Blastophaga grossorum*) have been completed and already a considerable amount of figs fertilized in this way have been put upon the market. The original home of the San José scale has, it is believed, been found in Northern China, where it is held in check by a lady-bird beetle (*Chilocorus similis*), which will be introduced into this country in the hope of thus repressing this pest. See FORESTRY.

AGRICULTURAL EDUCATION.

Considerable progress was made during 1901 in broadening and strengthening courses in agriculture in the colleges in the United States. The movement for the division of the general subject of agriculture into specialties to be taught by different instructors still continues. The Committee on Methods of Teaching Agriculture of the Association of American Agricultural Colleges and Experiment Stations completed its syllabus for the college course in agriculture. This divides the subject of agriculture into agronomy (plant production), zootechny (animal production), agrotechny (agricultural technology, especially dairying), agricultural engineering and rural economics. Thus far comparatively little attention has been given to the two latter branches of agricultural instruction in our colleges. There is, however, increasing interest in these subjects, and therefore good reason to believe that with the increase of resources of these institutions, more adequate courses along these lines will be provided. Notable recent advances along the line of agricultural engineering have been the establishment of a department of irrigation at the University of California, and the offering of special courses for irrigation canal superintendents and State water commissioners at the State Agricultural College of Colorado.

A new step of progress in agricultural education in this country is indicated in the plans for a Graduate School of Agriculture to be held in the summer of 1902 under the auspices of the Ohio State University and in cooperation with the United States Department of Agriculture and the Association of American Agricultural Colleges and Experiment Stations. The purpose of this school is to give advanced

instruction in the science of agriculture, and particularly in the methods of investigating agricultural problems and teaching agricultural subjects.

There has been a considerable increase in the total number of students attending agricultural courses in the colleges, but the great majority of these students are still unwilling or unable to complete the four years' course leading to the bachelor's degree. There is an increasing demand for short and special courses, and the colleges are meeting this to a greater extent than heretofore. A much larger amount of college extension work in agriculture is now being done than ever before. This includes, besides the wide dissemination of information through the experiment station publications, such things as nature-study lectures and leaflets, press bulletins, correspondence courses, farmers' institute lectures, exhibits at State and County fairs, and excursions of farmers to the colleges.

In providing for maintenance and new buildings at the agricultural colleges, the various State legislatures meeting during 1901 were more than usually liberal, so that in the aggregate these institutions now have materially increased resources. The State support of these institutions is changing from a temporary to a permanent basis. Colleges and universities receiving the benefits of the Acts of Congress of July 1, 1862, and August 30, 1890, are now in operation in all the States and Territories except Alaska, Hawaii, and Porto Rico. The total number of institutions in the United States maintaining courses in agriculture is 62; the aggregate value of the permanent funds and equipment of the land-grant institutions in 1901 is estimated to be \$67,060,000, of which \$1,928,000 was added in 1901, and their income was \$7,401,000. Out of a total attendance of 42,104 students, 6,860 were taking courses in agriculture.

The movement for the establishment of secondary agricultural schools and the introduction of nature study and elementary agriculture into the rural schools has increased in importance. Alabama continues to support nine Congressional district agricultural high schools, which annually accommodate about 2,000 pupils at a cost to the State of \$22,500. Minnesota has for a number of years supported a successful secondary school of agriculture in connection with the State university, and the legislature of 1901 appropriated \$2,000 a year for two years for the introduction of agriculture into the rural schools. The University of Nebraska has recently inaugurated a similar school of agriculture with a three-year course. A recent law in Wisconsin provides for the establishment of county agricultural high schools. In Missouri increased attention is being given to carrying out the provisions of the law requiring agricultural instruction in rural schools, and to prepare teachers for this work departments of agriculture have been established in three normal schools of that State. Through the efforts of the committee for the promotion of agriculture of New York a school of practical agriculture and horticulture has been put into successful operation at Briar Cliff manor, N. Y.

In many States the problem of improving the rural schools is causing general discussion, and there seems to be a marked tendency toward concentration; that is, the elimination of small schools and the establishment of centralized schools, often with free transportation for pupils living at a distance from the schoolhouse. This movement has in several cases resulted in the establishment of rural high schools, with the township or the county as a unit. Reports coming from sections where centralization has been tried show for these schools better supervision, better teaching, better buildings and other facilities for instruction, better health and morals on the part of the pupils, more regular attendance, a longer continuance of the large boys and girls in school, and considerably enriched courses of study. It is believed that this movement for the consolidation of rural schools will be an important factor in securing the general introduction of nature study with special reference to agriculture in the country schools.

The farmers' institute movement is growing in importance, attendance at the meetings is increasing, and State appropriations for this work are becoming more liberal. The institutes are now held in 43 States and Territories. In 19 of these they are under officials of agricultural colleges or experiment stations; in 17 they are under State or county officials; and in 7 they are under the joint control of State officials and the college or station officials. Successfully conducted institutes are found under each system of management. Some 2,000 institutes are now annually held in the United States, with an aggregate attendance of at least half a million farmers.

AGRICULTURAL EXPERIMENT STATIONS.

These are now in operation under the Act of Congress of March 2, 1887, in all the States and Territories and in Alaska, Hawaii, and Porto Rico. In Connecticut, New Jersey, New York, Hawaii, Missouri, Alabama, and Louisiana, separate stations are maintained wholly or in part by State funds. A number of substations are also maintained in different States. Excluding the substations, the total number

of stations in the United States is 60. Of these, 54 receive appropriations provided for by Act of Congress. The total income of the stations during 1901 was \$1,231,881. The stations employ 719 persons in the work of administration and inquiry.

The activity and success of the stations in bringing the results of their work before the public continued unabated. During the year they published 445 annual reports and bulletins. These were supplied to over half a million addresses on the regular mailing lists. A larger number of stations than formerly supplemented their regular publications with more or less frequent issues of press bulletins, and most of the stations report a large and constantly increasing correspondence with farmers on a wide variety of topics.

In Alaska stations have been continued at Sitka and Kenai, and a new station has been established at Rampart in the Yukon Valley. A preliminary agricultural survey of the Copper River region indicates that agricultural operations may be successfully conducted over a wide area there. It was shown that considerable quantities of hardy vegetables, such as potatoes, cabbage, cauliflower, turnips, lettuce, and radishes are already being grown in the interior, and there are large areas which may be used for this purpose and also for the production of grasses and forage plants. At the station at Rampart, rye and barley were matured. At Sitka the experiments with cereals, forage crops, and vegetables were continued and a considerable number of varieties were successfully grown. Good silage was also made of native grasses and stored in a log silo. At Kenai the experiments with cereals and vegetables were continued with considerable success. Seeds were distributed to 400 persons living in different parts of Alaska, and a considerable number of reports were received of those grown during the season of 1900. It is evident that the efforts of the government to aid in the development of agriculture in Alaska are greatly appreciated by residents of that Territory, and that they have already received substantial benefits from the work of the Alaska experiment stations.

In Hawaii a station was established by the national government in 1901 at Honolulu. Land has been cleared, buildings erected, and experiments begun. The station's work will include investigations in horticulture, coffee and taro culture, stock raising, poultry, diseases of plants and animals, and irrigation. The station for the sugar industry, supported by the Hawaiian Sugar Planters' Association, has been continued on an independent basis.

In Porto Rico a station has been begun but not yet permanently located, and experiments in coffee culture have been undertaken at Rio Piedras. Studies of injurious insects and plant diseases have been begun, and a soil survey of a portion of the island is in progress. Improved varieties of seeds and plants are being distributed.

The stations in Alaska, Hawaii, and Porto Rico are directly managed by the United States Department of Agriculture through the Office of Experiment Stations, which also continues to act as a central agency for all the stations in the United States. In 1901 this office issued Vol. XII. of the *Experiment Station Record* and numerous other publications largely based on the work of the stations. A collective station exhibit was made at the Pan-American Exposition. The stations in general were unusually prosperous in 1901. Their work was increased in extent and efficiency, especially by a closer affiliation with the Department of Agriculture and by the material enlargement of the resources of the colleges with which they are connected. The appreciation of the results of station work which practical farmers show increases from year to year.

A Bureau of Agriculture has been created by the Philippine Commission to conduct investigations and disseminate information regarding the agricultural resources and development of the Philippine Islands. Prof. F. Lawson-Scribner, formerly agrostologist of the United States Department of Agriculture, has been appointed chief of this bureau.

During 1901 there was much governmental activity for the advancement of agriculture in other countries both in the Old World and the New. The Russian Department of Agriculture and Imperial Domains inaugurated a system of commissioners of agriculture who will correspond in a general way to our commissioners of agriculture or to our secretaries of State board of agriculture. Each commissioner's office will have connected with it a corps of agricultural specialists who will work among the landowners and peasants. The Russian Department of Agriculture and Imperial Domains is also displaying considerable activity in its soil and forestry investigations and in the establishment of stations for the investigation of special subjects, such as the growing of flax, cotton, olives, etc.

In England the Board of Agriculture has made larger grants than formerly to agricultural colleges and societies for conducting agricultural investigations, and a private experiment station has been established in Lancashire. In Australia the Victorian Department of Agriculture is undergoing reorganization.

The Austrian government has recently established several experiment stations, notably the station for plant culture at Brünn, the station for investigations in plant and animal production at Otterbach, and an agricultural physiological station, with divisions of chemistry, physiology, and bacteriology, at Prague. In Hungary an experiment station for the analysis and study of wines was established in 1901 at Fiume.

France has established at Nogent-sur-Marne a Colonial Garden to have administrative control over French colonial stations and botanic gardens in different parts of the world and to furnish these institutions with seeds and plants. During the year oenological stations were established at Toulouse and Beaune and an agricultural station at Besançon.

In Germany two new stations have been established—a flax culture station at Sorau and a viticultural experiment station at Weinsberg. The West Indian Department of Agriculture, Barbados, has established three new stations at Montserrat and one at Tortola. Brazil has recently established a botanical garden and experimental demonstration field at San Vicente, and the Argentine Republic has decided to establish four experiment stations on the same general plan as those in the United States. A department of agriculture, with a small staff of experts, has been organized at Bangalore by the government of Mysore, India; also a dairy station at Gembloux, Belgium; a veterinary pathological institute and animal vaccine institute at Christiania, Norway; and an irrigation experiment station at Calgary, Canada. See DAIRYING, HORTICULTURE, and IRRIGATION.

AGUINALDO, EMILIO, the leader of the Filipino insurrection against the United States, was captured March 23, 1901, by Brig.-Gen. Frederick Funston (*q.v.*), at Palanan, in the island of Luzon, while in command of a temporary headquarters there. On April 2, he took the oath of allegiance at Manila and issued a proclamation to the Filipinos, in which he advised them to lay down their arms and acknowledge the sovereignty of the United States. He was assigned to quarters in Manila, under careful surveillance, and continued to advise peace among his old followers, it being his opinion that the Filipinos who held out against the American troops were ignorant of the real strength of the United States and unfamiliar with what had already been done toward restoring order in the islands. Aguinaldo was born about 1870, of Spanish parentage, and as a child served in the household of a Jesuit priest, where the opportunity to obtain an education was afforded him. At fifteen he entered the College of St. John de Letran at Manila, where he studied medicine, and in 1888 went to Hong Kong for further study. In 1896 he became prominent as a leader of the Filipino insurrection against Spanish rule, was exiled to Hong Kong, it is said in the pay of Spain, and when the American forces first occupied Manila in 1898, he cooperated with them. But his demand for Filipino independence, the condition of further aid from him, was denied by the American authorities, whereupon he set up a rebel government, of which he was the head. From that time (June 23, 1898) until he was captured, Aguinaldo directed the rebel forces with considerable ability, maintaining his supremacy by the exercise of an unusual shrewdness. His motives have been questioned, but he has generally been regarded as a shrewd guerilla fighter and a man of intelligence and force. Although at first in close confinement at Manila, his consistent friendliness toward the Americans soon gained him considerable liberty.

AHERNE, JAMES. See **HERNE, JAMES A.**

AIR-SHIP. See **AERIAL NAVIGATION.**

ALABAMA, one of the Gulf States of the United States, has an area of 52,250 square miles. The capital is Montgomery. Alabama was organized as a territory March 3, 1817, and admitted as a State December 14, 1819. The population in 1900 was 1,828,697, while in June, 1901, as estimated by the government actuary, it was 1,862,000. The population of the three largest cities in 1900 were: Mobile, 38,469; Birmingham, 38,415; and Montgomery, 30,346.

Finances.—The receipts for the fiscal year ending September 30, 1900, were \$2,656,350.78 and the disbursements \$2,198,420.17, leaving a surplus for the year of \$597,399. For the fiscal year ending September 30, 1901, the receipts were estimated at \$2,547,500, and the disbursements at \$2,526,970. The bonded indebtedness on September 30, 1900, amounted to \$9,357,600, entailing an annual interest charge of \$448,680. The total value of property in the state as returned for taxation in 1900 was \$266,893,288. At the same time, the tax rate was 7 1-2 mills, of which 5 1-2 mills was for general purposes and two mills for school and pension purposes. For the banking interests of Alabama, see **BANKS BANKING.**

Steel and Allied Industries.—Although Alabama is primarily an agricultural State, the census tables show that there has been a large growth in manufacturing and mercantile industries during the last half century. The population has increased during these years from 771,623 to 1,828,697, or 137 per cent., while the average

number of industrial wage-earners has increased from 4,936 to 52,902, or 971.8 per cent., aggregating in 1900 2.9 per cent. of the total population. The total amount of capital, exclusive of capital stock, invested in 1900 in mercantile industries was \$70,370,081, and the gross value of products, excluding material to the amount of \$21,844,174 re-used in the process of manufacture, was \$82,793,804. The large increase in the manufactures of Alabama is in a great measure due to the development of extensive deposits of iron, coal, limestone, and dolomite, which are found in unusual proximity and quantity in the Birmingham district. Directly dependent upon these natural resources is the manufacture of iron and steel, whose products in 1900 were valued at \$17,392,483, or 21 per cent. of the total value of the products of the State. Related to the iron and steel industry is the manufacture of foundry and machine-shop products, whose output in 1900 was valued at \$5,482,441, an increase of 149.7 per cent. since 1890. This industry has been stimulated by the large production of pig iron, and has in turn reacted to increase that production. Other important correlated industries are the manufacture of cast iron pipe, stoves, car wheels, boilers, engines, wire nails, tubing, and cotton ties. Owing to the fact that six railroads centre in Birmingham, car-shop and construction work has largely developed, the production in 1900 being valued at \$4,172,192, an increase during the decade of 163.9 per cent. Connected with iron manufactures is the manufacture of coke, whose products in 1900 were valued at \$3,726,433, giving Alabama third rank in the Union in this industry. It is noteworthy that the great development of manufactures in the northern part of the State has taken place largely without the advantage of navigable water for the cheap shipment of products. For years efforts have been made to connect the Birmingham district with tidewater at Mobile Bay by means of the construction of a canal and locks on the Warrior River. Of the five locks projected three were completed in 1895, and a route for the canal has been surveyed by United States engineers. It is estimated that water communication with Mobile would reduce freight charges on iron by 90 per cent.

Other Industries.—The manufacture of lumber and timber ranks second in importance among the industries of the State, the product in 1900 being valued at \$8,507,971, an increase of 51.2 per cent. in the decade. Dependent upon this industry is the manufacture of turpentine and resin, whose products in 1900 were valued at \$2,033,705. Notwithstanding the increase in the timber industry a considerable portion of Alabama's forests have never yet been cut. The lower part of the maritime pine belt is considered equal in extent and quality to the timber lands in the corresponding parts of Florida and Mississippi, and is said to be unsurpassed by the most favored sections of Atlantic pine forests. The third considerable industry in the State, the manufacture of cotton goods, is dependent upon Alabama's cotton crop, which in 1899 amounted to 1,103,690 commercial bales, or 11.4 per cent. of the total production of the United States. Cotton goods manufacturing is a recent industry in the State and has increased in the great ratio of 172 per cent. within the decade; products in 1890 being valued at \$2,190,771 and in 1900 at \$5,962,365. Allied to this industry is the manufacture of cotton-seed oil and cake, the products valued in 1900 at \$2,985,890, an increase during the decade of 148 per cent. Other industries are flour and grist milling, with products valued in 1900 at \$3,310,757, and the manufacture of fertilizers, the products in 1900 valued at \$2,068,162.

Constitutional Convention.—In accordance with the results of the election held in August, 1900, at which time the question of calling a convention to amend the constitution was affirmatively voted upon, a constitutional convention met in Montgomery in May, 1901, to revise or rather to rewrite the constitution. The most important work of the convention and the purpose for which it was primarily called was to draw up a new franchise law. For when the State constitution was adopted in 1875, the negro's right to vote was specifically guaranteed, in accordance with direction of Congress. As a result, extensive intimidation and ballot stuffing were practised to maintain the supremacy of the whites. That the whites did remain supreme is shown by the message of Governor Johnston to the legislature on May 2, 1899, in which, opposing the proposed convention, he said: "There is not a negro in all the Commonwealth holding an office under the present constitution, nor a justice of the peace, nor a constable, nor a single member of the General Assembly, nor has there been for nearly a generation." But it was thought by the State leaders that an end should be put to ballot stuffing and fraud, and that the disenfranchisement of the negroes should be accomplished by legal methods. The Democratic State platform, upon which the convention was elected, promised the voters to secure the legal maintenance of white domination without disenfranchising any white man except for crime and without violating the constitution of the United States. Owing largely to the excellent educational work done at Tuskegee Institute, Ala., and to the tact and ability of its president, Booker T. Washington, there was less antagonistic race feeling in Alabama than in several other southern States, and for this reason the proceedings of the convention were regarded with special interest. Shortly after

the convention opened a memorial, understood to have been drafted by Booker T. Washington, was presented, recounting the homely virtues of the negroes, their fidelity to their masters' interests at the time of the civil war, the errors and efforts they had since made, and concluding that while they knew that the task before the convention was a "delicate, trying, and perplexing one," they asked for such laws as would discriminate justly between good and bad citizenship wherever found and would not "merely change the name and form of fraud." This memorial was ordered by the convention to be immediately printed, and in other ways manifestation was made of a desire to remove from the convention all racial animus. Nevertheless the convention considered that negro suffrage should be restricted, and as this could not be done directly without violating the constitution of the United States, it was done indirectly and "ingeniously." See paragraph on Suffrage and Elections.

Other important and necessary changes made in the constitution, as stated by a committee of the convention in an open letter issued previous to the election of November 11, 1901, are as follows: The constitution of 1901 appropriates of its own vigor about eight times as much as the old constitution for public schools. In fact, the new constitution appropriates each year for this purpose nearly one-half of all the taxes levied and collected in the State, and it further directs the legislature to increase this fund from time to time as the resources of the State may justify. And although the new constitution prohibits a child of either race from attending a school of the other race, that provision of the old constitution is strengthened which provides that the public school fund shall be used equally for the benefit of both races. Under the old constitution, the legislators were so immersed in private and special bills to the exclusion of general bills that they came to represent almost solely their respective localities and not the State as a whole. Bills were habitually passed giving every manner of undue advantage to counties or corporations, and these local bills became an intolerable abuse. Under the new constitution, this evil is believed to have been absolutely annihilated, local and special bills being prohibited, and in order to prevent too frequent changes of laws, the legislature is to meet but once in four years. The governor also is believed to be saved under the new constitution from improper motives by the lengthening of his term to four years, making him ineligible to succeed himself, and denying him during his term of office and for one year thereafter the right to election or appointment to the United States Senate or any office under the State. The financial stability of counties and cities is protected by the provision that no county shall become liable for an amount including existing indebtedness of more than $3\frac{1}{2}$ per cent. of its assessed property; that cities and towns with a population of less than 6,000 cannot incur an indebtedness exceeding 5 per cent. except for the purchase and construction of public utilities, for which an additional 3 per cent. may be incurred; that cities of over 6,000 cannot become indebted for more than 7 per cent. of their assessed property except for improvements noted above, and that cities and towns of over 6,000 are forbidden to grant any municipal public utility franchises for a longer period than thirty years. Private corporations can no longer be chartered by a special act. The legislature is required to provide for the payment of a franchise tax by corporations, and when this tax is levied on foreign corporations, it must be in proportion to the amount of capital stock employed by the corporation in the State. Railroads are forbidden to give free passes or sell tickets at a discount to members of the legislature or any officer exercising judicial functions under the laws of the State. Special authority is given the governor to refund the State debt, and it is declared in substance that any appropriations made by the legislature shall not hinder the State from using all money in the treasury, if necessary, to protect the public faith. With these provisions removing the uncertainties of the present constitution, it is believed that there is no doubt that the State debt may be refunded at a much lower rate of interest, saving many thousands per annum to the taxpayers, and many times the cost of the convention. Amendments to the constitution may be proposed by three-fifths of the members of each house instead of as at present by two-thirds.

Provisions of the Constitution—Rights and Guarantees.—From the new constitution are omitted several of the features of the bill of rights of the old constitution adopted under the military pressure of the reconstruction days. Among these omitted provisions is that declaring that no educational or property qualification for suffrage or office shall ever be enacted; also, one announcing that the people of Alabama accept as final the established fact that there can be no secession from the Union, and, finally, one declaring that all citizens of the United States and of Alabama shall possess equal civic and political rights. In the new constitution the clause of the old constitution prohibiting the legislature from granting irrevocable grants of privileges, is strengthened by adding that "every grant of a franchise, privilege, or immunity shall forever remain subject to revocation, alteration, or amendment." In order to do away with some of the difficulties that have been encountered in criminal trials in the State, especially those where negroes have been

defendants and public feeling against them has run high, the new constitution provides that the legislature may by a general law provide for a change of venue at the instance of the defendant, and that such trials may be determined without the presence of the defendant if he is imprisoned elsewhere, and that while no person may be twice put in jeopardy for the same offense, yet judges may discharge juries for cause and the prisoner shall not then be deemed to have been placed on trial.

Legislature.—The new constitution changes the time for State elections from August to November; both State senators and representatives are to be chosen for four years and the legislature, instead of meeting biennially as before, is to meet quadrennially. To insure so far as possible honesty and efficiency in the legislature, several novel and interesting stipulations are made in the constitution. The most important of these are as follows: No one except legislators and press representatives may be admitted to the floor of the House except by unanimous vote—thus excluding lobbyists; no bill may become law until it has been referred to a standing committee of each House, acted upon by such committees and returned by them, and the action of the committee noted upon the journal of each House; no revenue bills may be passed during the last five days of the session, or, as it might be more properly put, "railroaded through during the closing hours of the session;" with a few excepted cases, the legislature is prohibited from passing special or local laws; but the legislature is directed to enact laws for the reasonable restraint, prohibition, and regulation of corporations and trusts, so as to prevent the unreasonable scarcity of articles or the restraint of competition or unreasonable increase in the prices of commodities. In the interests of both races, the legislature is prohibited from ever passing any law to authorize or legalize any marriage between any white person and a negro or descendant of a negro.

Suffrage and Elections.—The most important provisions of the new constitution were those restricting the suffrage with the avowed purpose of eliminating the ignorant or venal negro vote. The old constitution, as stated by a committee of the convention in an open letter to the people before the election of November 11, 1901, had been drawn up in 1875 when the North was still convinced that an electorate controlled by negroes was both possible and justifiable. This old constitution provided in the matter of the suffrage that all residents, not insane, who had not been convicted of crime were entitled to vote if they were citizens of the United States. The new constitution intended to adjust the suffrage to the actual needs and conditions of the State, provided a double electoral qualification system so that, first, all white persons then in the State might be registered, and that, second, all other persons might register whose qualifications would make them desirable citizens. More exactly, the constitution provided that at any time until December 20, 1902, the following might register as life electors: all persons who had served in the armies of the United States or of the Confederate States, and all descendants of such persons; and all persons who were of good character and who understood the duties and obligations of citizenship under a republican form of government. Of this good character and the duties of citizenship, a board of three registrars appointed in each county were to be the judges, though appeals from their decisions might be taken to the State courts. Second, after January 1, 1903, all those not previously registered as life voters might vote who were qualified as follows: First, those who could read and write any article of the constitution, and who, unless physically disabled, had been engaged in some lawful occupation or calling for the greater part of the twelve months preceding the time they offered to register, or those who were either *bona-fide* owners of forty acres of land in the State or owners of real or personal property whose assessed value was \$300 or more. The clause prescribing that the voter must have been engaged in some lawful occupation was stated to have been specifically aimed against those negroes of the younger generation who were sufficiently educated not to be debarred by an educational qualification, but who were nevertheless too lazy to work, who were undesirable citizens generally, and apt to be politically corrupt.

Executive.—Novel features in the formulation of rules for the executive department of the government provided that the attorney-general, secretary of state, and state auditor should constitute a board of pardons to advise the governor as to all petitions for pardon, but that the governor might act either in accordance with or contrary to their recommendations, and that if a prisoner escaped from a sheriff through the latter's fault and suffered death or other bodily harm, the sheriff might be impeached and removed from office and should not be eligible for any other office during the time he had been elected to serve as sheriff.

Elections.—At the elections held in Alabama on November 11, 1901, for the ratification or rejection of the new constitution, the vote cast was 108,613 for adoption and 81,734 for rejection; thus giving a majority for adoption of 26,879. The total vote cast, 190,347, was much heavier than that in 1900, when the total vote cast for president was 155,240 and for governor, 162,319, indicating apparently that the negroes

who in other southern states had shown themselves strangely apathetic in the matter of the curtailment of their suffrage rights, had in Alabama voted up to their full strength. According to the 1900 census figures (see **NEGRO PROBLEM**, paragraph Census) a little more than 59.5 per cent. of the male negroes of voting age in Alabama are illiterate. Under the new constitution, this means that that per cent. of all the negroes in the state will be disenfranchised. But these negroes may vote in accordance with the provisions of the new constitution so soon as they can read and write the English language and prove themselves industrious citizens.

State Officers.—Governor, W. D. Jelks; secretary of state, R. P. McDavid; adjutant-general, W. W. Brandon; attorney-general, C. G. Brown; treasurer, J. Craig Smith; superintendent of education, J. W. Abercrombie; commissioner of agriculture, P. R. Poole; commissioner of insurance, N. R. McDavid—all Democrats.

Supreme Court.—Chief justice, Thomas N. McClellan; associate justices, Jonathan Haralson, John R. Tyson, Henry A. Sharpe, and James R. Dowdell—all Democrats.

Congressional Representatives (57th Congress): In the House—George W. Taylor, from Demopolis; A. A. Wiley, from Montgomery; Henry D. Clayton, from Eufaula; Sidney J. Bowie, from Talladega; Charles W. Thompson, from Tuskegee; John H. Bankhead, from Fayette; John L. Burnett, from Gadsden; William Richardson, from Huntsville; Oscar W. Underwood, from Birmingham—all Democrats. In the Senate—E. W. Pettus (until 1903), from Selma; and John T. Morgan (until 1907), also from Selma—both Democrats.

ALASKA. An unorganized territory of the United States purchased from Russia in 1867, and governed under a civil code passed by Congress in 1900. The area of Alaska, as shown by the most recent surveys, is approximately 590,884 square miles, or about one-sixth of the whole territory of the United States. The population, as shown by the census of 1900, is 63,592, of whom 25,536 are natives. The increase in population since 1890 has been 31,450, or 98.4 per cent. The average number of persons to each one hundred square miles is approximately eleven. There are four cities of more than 1,000 inhabitants, namely, Nome, 12,486; Skagway, 3,117; Juneau, 1,864; and Sitka, 1,396. The city of administration is Sitka. Alaska constitutes, by the act of 1900, a federal judicial district, with three divisions and three courts. Alaska has no delegate to Congress, nor has it a local legislature.

Mining.—The mining industry of Alaska was vigorously prosecuted during the season of 1901, the output in the region of Nome alone being estimated at \$7,000,000, although the development of the mines in this vicinity was greatly hampered by conflicting mining claims (see paragraph Judiciary Scandal). Placer mining still attracts the greatest attention, because the returns are immediate and can be conducted by individuals with very little capital. Mines at the head waters of the Koyukuk River also attracted much attention during the year, and some of the mining camps there were established as far north as latitude 67°. These are the most northerly diggings on the continent. At this rate, the governor remarks, the American miner will keep on till he reaches the pole. Other productive regions during the year have been on the Porcupine and Tanana Rivers and near the headquarters of the Kuskokwim. Quartz mining makes great advances each year, the quartz being very widely distributed, though as a general thing the ore body is of a low grade, averaging in many cases not more than \$2.00 per ton. Silver and platinum have been found in paying quantities, and discoveries of tin and cinnabar have been reported. There are rich veins of iron ore, but very little attention has been paid to iron, both on account of heavy transportation charges and because of the search for gold. Copper mines have been opened up on the shores of Prince William's Sound, Prince of Wales Island, and Dall Island. The governor expresses the opinion that the mining interests in Alaska have become so extensive and valuable as to render advisable the appointment of a commissioner of mines, whose duty would be to exercise general supervision over the mining operations of the district, to protect mining companies against unjust litigation for damages, and to require the companies to conform to regulations prescribed for the protection of miners.

Fisheries.—Next to mining, the fishing industry is probably the most important of Alaska, and it has the added advantage of permanence and safety for investment. The salmon catch for the year 1900 had a market value of over \$6,000,000, and for the season of 1901, it was estimated at about \$7,000,000. Large quantities of halibut and other fish were also taken, shipped to ports on Puget Sound, and thence taken to inland markets on refrigerator cars. The fish industry, however, may be greatly developed; along the shores of Alaska are cod banks hitherto untouched, aggregating in extent many thousands of square miles, and by the establishment and maintenance of salmon hatcheries by the federal government, a continuous and increasing supply of this fish would be assured each year.

Agriculture.—The agricultural possibilities of Alaska have been but recently recognized. Instead of being almost wholly, as has been popularly supposed, a bleak, ice-

covered land, valuable only for its gold fields, the surveyor-general of the territory reported in 1901 that he estimated, from data collected from authentic sources, that not less than one-fifth of Alaska was tillable and could be utilized for pasture and for raising a large diversity of agricultural crops. The climate of Alaska, especially in the southwest, is alleged to be better for agricultural purposes than the great plains of Wyoming, Montana, and some parts of Nevada. Even hundreds of miles north of Skagway the attempts at gardening and farming are said by the governor of the territory to have been surprisingly successful. Hay and grain are raised at Fort Selkirk; vegetables of many kinds at Dawson; while the great river valleys like those of the Yukon, Tanana, Kuskokwim, Sushitna, Knik, and Copper embrace cultivable areas large enough for good-sized States. The quantity of grass which every year goes to waste in Alaska is asserted to be of greater market value than the gold output. The great obstacle to the development of these interests has consisted, up to the present time, not so much in inaccessibility of the lands and the cost of transportation as in the fact that settlers are unable to acquire any title to the lands they occupy. See paragraph Public Lands.

Other Industrial Interests.—The timber of Alaska, all of which belongs to the government, is one of the most valuable resources of the territory. Although a number of sawmills are allowed to cut timber by payment to the government ten cents for each hundred cubic feet, the amount thus cut represents but a small fraction of the amount of wood used in the territory each year. Nearly every board that is taken to western Alaska from Yakutat to Port Barrow is shipped from Puget Sound or California, and a large part of the wood used in southeastern Alaska comes also from sound ports. The reason for this is that lumber can be manufactured more cheaply in the large mills in the States than in Alaska. There is an enormous annual waste of timber in the territory caused by the falling and decay of trees that have long since attained their full growth. It is recommended that the government enact laws allowing the cutting of the full-grown trees and protecting the young timber from destruction. In the opinion of the governor, the fur trade of Alaska is doomed to extinction. The sea otter and fur seal are fast disappearing for lack of proper protection by the United States; the beaver has been driven to remote districts; the Arctic fox, the bear, and mink seem to be the only fur-bearing animals that are still found in considerable numbers. The enacting of a stringent game law by Congress, in order to afford better protection to the moose, caribou, deer, and other large game, is advocated.

Communication.—Military telegraph lines are now in operation in Alaska between St. Michael and Mulato, Eagle, and Dawson; lines are being constructed between Eagle and Volges, and Mulato and Fort Gibbon, and cables have been laid between St. Michael and Nome, Juneau and Skagway. The cable along the shore from southeastern Alaska to Unalaska on the Aleutian Islands would be of great importance commercially, and on account of the commanding position of Unalaska, would be valuable from a strategic point of view. Attention is called to the necessity of communication by cable with the States and the Philippines. Cable communication between the States and the Philippines is recommended by way of Alaska, as this would be the shortest and, commercially, the most advantageous route.

Education.—Under the Congressional act of 1900, the main revenue of Alaska was directed to be raised by license fees exacted from the various classes of business concerns operating in the territory. Outside of incorporated towns, one-half of the amount of these licenses, minus the expenses for the maintenance of the courts, was to be used for educational purposes. During the fiscal year ending 1901, in addition to the towns of Skagway, Juneau, and Ketchikan, previously incorporated, the towns of Nome, Treadwell, Eagle, and Valdes were incorporated, and the schools in these towns were placed in accordance with the act of 1900 under the care of the local authorities. Whether the funds received from licenses outside of the incorporated towns were sufficient to support schools outside of the towns, it was not possible, as stated by the secretary of the interior, to ascertain by the end of the year 1901. In the opinion of the governor, however, the funds would not be sufficient, and the governor regretted that Congress had withdrawn the usual annual appropriation of \$30,000 previously made for the purposes of education in Alaska.

Public Lands.—Except for lands acquired by individuals for mining purposes, nearly all land in Alaska is at present a part of the public domain. In fact, as stated by the secretary of the interior in his annual report for 1901, it is practically impossible under existing conditions for persons to acquire land in Alaska except for mining purposes. For, although by a Congressional act of 1898, the homestead laws were extended to Alaska, in so far that they permitted persons to acquire not more than eighty acres of land each, yet title to these lands could not be acquired until they were surveyed, and no public lands have as yet been surveyed for this purpose. It is solely on this account, as is stated, that there is really no permanent population in Alaska, and that consequently not only could no adequate

taxes be raised for the maintenance of a territorial government, if one was formed, but nearly all industries in Alaska, except that of mining, have so far been neglected. Yet, as stated by competent persons, the natural resources of Alaska, especially as regards the possibilities of agricultural products (see paragraph Agriculture), are very great, and all that is needed to develop them is the enactment of proper laws by Congress. It was recommended, therefore, by the governor of the territory that Congress should immediately appropriate money for the survey of homestead lands so that title could be acquired thereto, and also that the amendments made to the homestead laws in 1898, when they were extended to apply to Alaska, be revoked. For these amendments prescribed that not more than eighty acres of land could be acquired by each person, and that moreover title could not be acquired to more than one-half of the shore lines of navigable streams. The governor considered that the right to title along streams should be freely given, and that owing to the great expense of transportation both to and from Alaska, title should also be allowed, as was always done in the case of other territories of the United States, to at least 160 acres of land.

Judiciary Scandal.—Under the Congressional act of 1900, dividing Alaska into three federal judicial districts, Arthur H. Noyes was appointed justice of the second district, with headquarters at St. Michael, near the Nome gold fields. At that time the shore line of Alaska for some fifty miles north from Cape Nome was staked off by placer miners, who had recently discovered gold in large quantities. Owing to the lack of definite laws governing the filing and right to possession of these claims, nearly the whole area comprehended in the long strip of beach was under litigation. These litigations were awaiting settlement at the time Justice Noyes assumed jurisdiction. From the time of his arrival, scandals arose concerning his use of the judicial power. It was asserted that he had not only shown incompetence and negligence in the exercise of his office, but that he had shown marked favors to a few of the larger gold companies in the appointment of receivers to the disadvantage of the smaller claim holders. On August 27, 1901, a petition was signed by fifty-two members of the Nome bar, praying for the removal of Justice Noyes, claiming that he had lost the confidence and respect of the bar, of the court, and of the residents of his judicial district; that his orders and decrees were violated and treated with open contempt, and that the introduction of a fearless and honest judge was urgently required at Nome to prevent further riot and bloodshed over disputed claims, to relieve the congested court calendar, and to protect life, liberty, and property. At about the same time, the matter was brought to the attention of the Circuit Court of Appeals for the Ninth Circuit in California, which court vacated certain orders that Justice Noyes had made late in the fall of 1900 and later found him guilty of contempt of court for not complying with its mandates, and imposed a fine upon him of \$1,000. Pressure was then brought upon the attorney-general of the United States to order Justice Noyes's removal, both on the findings of the court in California and on account of the charges brought by the bar and private residents of Nome. The whole episode was declared by Hon. John G. Brady, governor of Alaska, to have been the most unfortunate in the history of the territory. For not only had the adjudication of the most pressing conflicting mining claims been postponed, but feelings of doubt and uncertainty had been created in the minds of the people inimical to the entrance of capital into Alaska and to the development of both private and corporate mining claims.

Needs of the Territory.—In his annual report for 1901, the governor stated that he did not recommend the authorization by Congress of a territorial form of government for Alaska. For owing largely to the inability of residents to acquire title to land in the territory, there was not a sufficiently large or stable population to raise the revenue necessary for this form of government. The governor did recommend, nevertheless, that Alaska be allowed a delegate in Congress to represent its interests, and he especially recommended that Congress should make appropriations for the immediate survey of lands so that title could be acquired to them under the modified homestead acts extended to Alaska in 1898. Other recommendations were for the passing of a bill that would allow the natives to acquire citizenship; for the establishment of cable communication between Alaska and the United States; for the establishment and maintenance of a hospital in southeastern Alaska, and for the building of a penitentiary.

See MEASLES, PUBLIC HEALTH, SMALLPOX.

ALBA, Duke of, Don CARLOS MARIA ISABELLA STUART, Spanish nobleman, died in New York City, October 15, 1901. He was born in Madrid, Spain, December 4, 1849, and inherited from his father numerous titles and estates. He possessed four dukedoms, eleven marquisates, and fourteen titles of count, was a Spanish senator and chamberlain, and was a peer of France. While a guest of Sir Thomas Lipton during the last international yacht races at New York, he became ill and died after a few days.

ALBANIA. See **TURKEY.**

ALCOHOL. The discussion of the food value of alcohol was continued during 1901. The dictum of Professor Atwater, of Wesleyan University, that alcohol is a food in the sense that it supplies energy to the body, while not forming tissue, has been accepted by some as an old physiological fact. Several investigators, however, have combated this statement, as also the former teaching that alcohol is an excellent remedy in acute infectious diseases. Doyen, Abbot, Verlaguss, Ranelletti, and Goldberg seem to agree that alcohol is a cell poison, although possessing a high caloric value. T. Alexander Mac Nicholl, of New York, in the investigation of heredity as a factor in mental deficiency, traced the family history of 463 children in 150 different families through 3 generations. Of these children, 313 had drinking fathers, 51 had drinking mothers, 205 had drinking grandparents, and 246 had drinking parents and grandparents. Of the children of drinking and neurotic ancestry, 87 per cent. were mentally deficient, and 76 per cent. suffered from some neurosis or organic disease. Of 231 children with total abstinence antecedents, less than 3 per cent. were dull, and but 18 per cent. neurotic. Of 24 families of drunken parents, including 113 children, 93 had organic diseases, 66 were mentally deficient, 7 were idiots, 8 were dwarfs, 7 were epileptics, and 16 were drunkards. Of the 236 children of moderate drinkers, 186 had organic diseases, 169 were mentally deficient, 8 were idiots, 8 were insane, and 21 were drunkards. Of 116 children in 31 families with neither neurotic nor drunken ancestry, 20 had organic disease, 3 were mentally deficient, and 1 was a drunkard. Thus the children of drinking parents show less than 12 per cent. of normal conditions of mind and body, while the children of total abstainers show about 82 per cent. Mac Nicholl concludes: "Alcohol is a most active agent in the production of hereditary degenerations. The families of drink imbibers in large measure augment the number of drunken, diseased, and defective members of society." Of 300 suicides, upon whose bodies Professor Meller, of Kiel, made autopsies during the past five years, 143 had organs diseased by alcoholism. Hirschl, of Vienna, reports that 30 per cent. of the men admitted to the insane department of the Vienna General Hospital gave a history of chronic alcoholism. Of these alcoholic patients, 43 per cent. died from delirium tremens, and 28 per cent. were committed to insane asylums for life.

ALDRICH, LOUIS, American actor, died at Kennebunkport, Me., June 17, 1901. He was born in Ohio, in 1843, and early in life went on the stage. After a season of starring in California and Australia, he joined the Boston Theatre stock company, where, in 1866, he played Nathan to the famous Leah of Miss Bateman. Later he was leading man at Mrs. John Drew's Arch Street Theatre, Philadelphia, and at Wood's Museum, New York City, where he played second parts to E. L. Davenport. Aldrich's best-known work was in *The Danites* and *My Partner*. In 1870 he appeared in *The Kaffir Diamond* and *The Editor*, with doubtful success. He was for many years actively connected with the Actors' Fund of America, serving as its vice-president and president. His power as an actor was greatest in melodrama, though successful also in certain lighter rôles requiring rough humor and pathos.

ALEXANDRA, Queen of England, acceded to the title of Queen upon the death of Queen Victoria (*q.v.*), January 22, 1901, when her husband, Edward VII. (*q.v.*), ascended the throne. She was born December 1, 1844, and is the eldest daughter of King Christian IX. of Denmark, and the sister of the Empress of Russia and of the King of Greece. She married Albert Edward, Prince of Wales, March 10, 1863, and four of the six children born to them survive, the eldest, now Prince of Wales, being the heir-apparent to the throne.

ALEXIS, PAUL, French novelist, died in Paris, July 30, 1901. He was born at Aix, France, June 16, 1847, and was educated at the college there. Going to Paris at an early age, he became a friend and literary follower of Zola, and allied himself with the so-called naturalistic school of fiction writers. The increasing prominence of Zola's work lifted Alexis out of comparative obscurity and gave his writings considerable popularity. One of his works was an extended and apologetic study of his master; and a later series of laudatory articles concerning Zola involved him in a duel with Albert Delpit.

ALFRED THE GREAT MILLENNIAL. The thousandth anniversary of the death of Alfred the Great was celebrated in Winchester, England, with a series of commemorative exercises September 18-21, 1901. These exercises began with visits to Westgate, Castle Hall, Hyde Abbey (where Alfred was buried), Wolvesey, St. Cross, and other places connected with the history of the Saxon king, and included readings from *Becket*, by Sir Henry Irving, and lectures on King Alfred the Great, by Frederic Harrison, and the Coinage of Alfred the Great, by Sir John Evans. The culminating event occurred on September 20, when a colossal bronze statue by Hamo Thornycroft was unveiled, and an eloquent address delivered by the Earl of

Rosebery, in which he described the remarkable qualities of manhood and leadership exhibited by the great Saxon king, in the course of which, having in mind the recent death of President McKinley, he said: "King Alfred wrought immortal work for us and for our sister nation over the sea, which in the supreme moments of stress and sorrow is irresistibly joined to us across the centuries and across the seas." A procession, participated in by academic, civic, and ecclesiastical representatives escorted by military and naval forces, preceded the unveiling of the statue. The ceremonies were under the charge of a large committee of representative men of Great Britain and the United States, over which the Lord Mayor of London acted as chairman, while Alfred Bowker, mayor of Winchester, was secretary. King Edward was the patron. The English Lords of the Admiralty launched a first-class cruiser of 14,000 tons in October, to which they gave the name of King Alfred, in commemoration of the celebrations.

A month later the memory of Alfred was celebrated in New York City by a series of exercises that began with a special memorial service in St. Paul's Chapel, on October 27, when the sermon was preached by the Rev. Henry Lubeck, in which he compared King Alfred and George Washington, saying that they were alike in many points of character, that it was fitting the memory of the great King should be celebrated in a church where the first President of the United States had been wont to worship. If, said the preacher, King Alfred's memorial celebrations should be an additional cause for harmony between the English and the American people, then there was one more benefit to the human race that could be laid to the credit of the King. On October 28, the accepted date of the death of Alfred, a banquet was held at Delmonico's, at which Mr. Alfred Bowker, the mayor of Winchester, was the guest of honor. Toasts were drunk to the President of the United States, King Edward VII., scion and heir of Alfred; Alfred the King, responded to by Mr. Bowker; Alfred the Statesman and Lawgiver, by Mr. Stewart L. Woodford; Alfred as a Constitutional Monarch, by Mr. John G. Bourinot; Alfred in Relation to Literature and Religion, by Mr. Hamilton W. Mabie; Alfred the Author, by Mr. Francis A. March; and Alfred the Soldier and Sailor, by Mr. Wager Swayne. A collection of books, manuscripts, and engravings, relating to King Alfred and his times, were placed on exhibition in the Lenox Library, New York, beginning with October 28, and continued during the months of October and November. As a permanent memorial the trustees of the New York Public Library, Astor-Lenox-Tilden foundation, have been requested to set apart an alcove or annex, to be known as the Alfred Memorial Library, to be devoted to literature relating to the Anglo-Saxon period, and to include records of all the celebrations throughout the United States. If sufficient money is obtained, it is desired to establish in connection with the library a series of annual lectures on the Anglo-Saxon period by a distinguished scholar, either from Great Britain or the United States.

The interest aroused in these various commemorative exercises naturally led to much study of the period of Alfred, and it has been well said that "later historians have but repeated the conclusions of their predecessors, nor has searching modern scholarship removed from Alfred's brow a single leaf of the five-fold laurel, of king, soldier, poet, law-giver, and saint, that has for a thousand years encircled it." A book of interest in connection with the Millennial is *Alfred the Great*; containing chapters on his life and times, by Frederic Harrison, Charles Oman, Professor Earle, the Bishop of Bristol, Sir Clements Markham, Sir Frederick Pollock, and Rev. W. J. Loftie; also containing an introduction by Sir Walter Besant, and a poem by the Poet Laureate, edited, with preface by Alfred Bowker (London, 1889); also *The Story of King Alfred*, by Walter Besant (New York, 1901).

ALGERIA, a country of northern Africa, is usually regarded as a colony, but technically is a province of France. The capital is Algiers.

Area and Population.—The total area of the three departments, Oran, Algiers, and Constantine, comprising Algeria, is stated at 184,474 square miles. The southern boundary is not well defined, and some 123,500 square miles of the Sahara, with a population of 50,000, are claimed by France as belonging to the province. The total population in 1896, exclusive of the French army, was 4,429,421. The population according to the census of March, 1901, was 4,774,042, divided by departments as follows: Constantine, 2,039,458; Algiers, 1,631,476; Oran, 1,103,108. The French colonists numbered about 292,000. Most of the inhabitants are Mohammedans.

Government and Finance.—The province is administered by a governor-general (M. Paul Revoil), who is largely directed by the French ministers in Paris. The legislative power is vested in the French chambers, in which each of the three departments is represented by one senator and two deputies. On June 3, 1901, a French law went into operation authorizing Algeria to discuss and vote its own budget, which had hitherto been done by the French chambers. The extreme south of the country is under military rule.

The largest items of revenue are direct taxes and customs, and the largest expenditures are for public works, instruction and worship, and finance. The estimated revenue and expenditure for 1901 were 55,314,144 francs and 55,237,675 francs respectively (the franc is worth 19.3 cents). The figure for expenditure is exclusive of the estimates for war, marine, and service of the debt, which, if added, would show a considerable deficit. Such deficits, which are usual, are met by France.

Industries and Commerce.—Agriculture is the chief occupation of the inhabitants. The production in quintals (220.46 pounds) in 1899, was reported as follows: Barley, 7,203,065; rye, 5,021,165; wheat, 1,042,908; oats, 658,067. In that year there were produced 4,502,028 hectolitres of wine; in 1900, 5,444,180 hectolitres. Cork and esparto are important products. Algeria is rich in mineral deposits, but development has been retarded by lack of transportation facilities. From 1896 to 1900 Algeria exported 3,845,566 tons of mineral ores; of these 2,553,600 were iron, 1,136,200 phosphates, 135,800 zinc, 16,400 lead, and 3,500 copper. The outputs in tons for 1899 and 1900 were respectively: Iron, 633,300 and 604,000; phosphates, 281,000 and 273,500; zinc, 36,900 and 30,200; lead, 6,200 and 2,100; copper, 1,600 and 24. The foregoing figures show a total decline of about 50,000 tons, but the outlook for 1901 was more favorable. It was expected that work would be resumed in the Guerromna mines, abandoned since 1893, and other enterprises were projected. In the special trade the imports and exports in 1898 amounted to 290,059,706 francs and 265,543,209 francs respectively, the imports from and the exports to France being 225,535,389 francs and 224,451,296 francs respectively. Similar figures for 1899 are 309,947,382 and 325,407,699 for the total, and 260,421,593 and 271,467,620 for the French trade.

Communications.—One of the most important methods taken by the French government in its successful development of Algeria is the construction of roads, railways, harbors, etc. In 1898 the national roads had a total length of 1,815 miles. The railways in the same year aggregated 1,821 miles, and in 1900 2,156 miles; these figures include 325 miles in Tunis (*q.v.*). The railway extending from the coast to Ain-Sefra, in Southern Oran, is being continued still further south; the section from Ain-Sefra to Zobia (125 kilometres) was opened in October, 1901. In 1898 there were 7,260 miles of telegraph line. A telegraph cable between Oran and Tangier (Morocco) was opened on June 24, 1901.

History.—During 1901, violent anti-Semitic feeling in Algeria resulted in riots and other disturbances; there was a number of native outbreaks more or less important. In April, the Arab tribe known as the Beni Ben Asser sacked the village of Marguerite, 50 miles from Algiers, killing many of the inhabitants. The rebels were driven to the mountains by the troops. The outbreak led the governor-general, M. Jonnart, to address to the Algerian prefects a circular in which he reiterated the need of applying various administrative reforms which he proposed in September, 1900. He insisted that it was the duty of the administrators of the mixed communes to lay aside "red tape" and to "participate actively in the progress of ideas and the general life and progress of the community by taking the initiative in proposals intended to favor not only the development of colonization, but the condition of the natives and their material and moral situation." In a debate in the French chamber on the Algerian uprising, Algerian deputies accused British missionaries of carrying on an anti-French propaganda and distributing rifles among the natives. The latter accusation was subsequently declared by the premier, M. Waldeck-Rousseau, to be entirely false. On May 17, 1901, M. Jonnart resigned the governor-generalship on the ground of ill health. He was succeeded, June 18, by M. Paul Revoil. M. Revoil, who is a brother of the late Georges Revoil, the explorer of Somaliland, has occupied a number of government positions, including the posts of minister to Brazil, sub-resident at Tunis, and minister to Morocco. See FRANCE (paragraph Colonial Policy).

ALIEN INSANE. See INSANITY.

ALLAN, ANDREW, Canadian shipbuilder and owner, died in Montreal, Quebec, June 27, 1901. He was born at Saltcoats, Scotland, December 1, 1822, and went to Canada in 1839. In 1846 he joined his brother in Montreal and the firm established a line of fast-sailing packets between Canada and Great Britain, to which in 1853 were added steamships. In 1882 Allan became head of the company, which is now known as the Allan Line. For some years he was chairman of the Board of Harbor Commissioners of Montreal.

ALLAN, GEORGE WILLIAM, Canadian statesman, died at Toronto, Canada, July 24, 1901. He was born at York (now Toronto) January 9, 1822, was educated at the Upper Canada College, and began to practice law in 1846. After an extended tour of the world, Mr. Allan entered municipal politics, and in 1885 was elected mayor of Toronto. In 1858 he was sent to the Legislative Council of Upper Canada as a representative of Toronto, a seat which he held until the confederation in

1867. By royal proclamation he was called to the newly organized Canadian Senate in the same year, and remained a member until his death. He served as speaker of the Senate (1888-91), and was appointed (1891) a member of the Canadian Privy Council. From 1877 he served as chancellor of the University of Trinity College at Toronto. He was a man of generous public spirit.

ALUMINUM. The production of aluminum in 1900, as reported by the U. S. Geological Survey, was about 6,000,000 pounds, as compared with 5,200,000 pounds in 1899. All of this was manufactured by the Pittsburg Reduction Company, which contemplates the erection of works at Shawanigan Falls, Quebec. The total value of the imports for 1900 was \$50,444, and included the crude material, bars, rods, sheet and manufactured aluminum. There is a tendency to use aluminum instead of copper in the manufacture of electrical conductors, on account of its cheapness, and several transmission lines of this material have been erected. Aluminum conductors have not been in use long enough to establish the durability of the metal. Aluminum, when used for electrical work, must be very pure, for the presence of impurities has a marked effect on the conductivity, the action of iron being especially noticeable. With regard to the resistance of the wire to corrosion, sodium seems to exert the most injurious effect, after which comes silicon. J. B. C. Kershaw found that aluminum became badly corroded in towns where there was much sulphurous acid gas in the atmosphere. J. H. Pratt has published a paper on the *Sources and Uses of Aluminum* (*American Manufacturer*, Oct. 31, 1901).

AMBIDEXTERITY. See **PSYCHOLOGY, EXPERIMENTAL.**

AMENT, WILLIAM SCOTT, an American missionary in China, one of the eight hundred white Christians besieged in Peking during the summer of 1900. His action in appropriating a deserted Chinese residence for the housing of the native Christians under his charge and disposing of certain articles found in the house, was widely discussed in the press. He was born at Owosso, Mich., September 14, 1851; educated at Oberlin College and Andover Theological Seminary, and in 1877 went to China as a missionary under appointment of the Foreign Missions Board. After serving three years at Pao-Ting, he was transferred to Peking. Dr. Ament was in charge of native Christians, to the number of 3,000, and of 800 white residents when Peking was relieved by the allied forces in June, 1900. As an expedient to provide shelter for those under his charge, he seized the house of a Boxer leader, and, to provide food, sold clothing and bric-à-brac found in the house to the amount of \$2,500. Through an agreement with the Chinese government, this sum was deducted from an indemnity fund of \$30,000 demanded for the families of murdered Chinese Christians and for loss of property due to the Boxer uprising.

AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE. See **POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF.**

AMERICAN BOARD OF COMMISSIONERS FOR FOREIGN MISSIONS, founded in 1810, thereby claiming the distinction of being the oldest foreign missionary society in the United States, has in the past 90 years of service sent out 2,324 missionaries and organized some 500 churches, into which have been received nearly 155,000 members, a work requiring the expenditure of about \$32,000,000. The board in 1901 maintained in 20 missions with 97 stations, and numerous outstations and places for stated preaching, 544 missionaries and 3,483 native workers; there are 505 churches and 929 Sunday-schools, including respectively 50,892 members and 66,601 scholars, statistics which indicate a year of growth. The medical and educational departments are noteworthy features of the work; some 40 persons are engaged in the former branch, while the latter maintains 1,238 schools, not including 13 colleges with 2,132 students and 17 theological seminaries with 228 students, which have a total attendance of 62,188 pupils. Contributions from home sources in 1901 aggregated \$697,370, to which was added \$147,879 by native Christians, a total of \$845,249. The ninety-second annual meeting of the board, October 8-11, 1901, in Hartford, Conn., witnessed the liquidation of the entire debt of \$102,000, an excess over that amount being subscribed. The resumption of missionary work, as far as possible, in the disorganized Chinese fields was reported, and interesting figures, based on the amount of home and native contributions in proportion to wage rate prevailing in lands of these two sources, were offered to show that the natives are not mere beneficiaries. It is worthy of note that, of the total amount of contributions, but 6½ per cent. on the average is expended on administration, the remainder being applied directly to missionary work. The convention of 1902 will meet in October, at Oberlin, Ohio. Rev. William Scott Ament of the American Board was the central figure in a controversy in 1901 over missionary methods in China; the discussion, provoked by an article by Mark Twain in the *North American Review*, assumed broad proportions in the press. The charge of robbery was met by Mr. Ament's explana-

tion that the collected indemnities went to reimburse native Christians (see **AMENT, WILLIAM SCOTT**). The abduction by brigands of Miss Ellen M. Stone, a missionary of the board to Bulgaria, has given rise to general interest and has initiated a widespread discussion on the ethics of ransom. See **TURKEY** (paragraphs on History).

The administrative office of the organization is at 14 Beacon Street, Boston. President, Samuel B. Capen, LL.D.; district secretaries, Rev. Charles C. Creagan, D.D., 105 East Twenty-second street, New York City, and Rev. A. N. Hitchcock, D.D., 153 La Salle Street, Chicago.

AMHERST COLLEGE, Amherst, Mass., founded in 1821, had in 1900-01 a faculty of 36 and a student body of 404. President, George Harris, D.D. During 1901 an addition of \$210,000 was made to the endowment. Plans were adopted for the erection of an astronomical observatory during the coming year. During the year there were slight changes made in the curriculum, in the form of additional courses in Greek and Italian art, and in navigation. The college also adopted the plan of making all courses elective after the freshman year. The income for the year from all sources was \$104,000.

ANÆSTHESIA. The custom of giving nitrous oxide, or "laughing gas," as a preliminary to ether, is becoming common in large cities, where operations are frequent and professional anæsthetists are to be found. The advantages of this method of producing general anæsthesia are its agreeableness, especially to the nervous or to children, its avoidance of the irritation and choking sensations during the first stage of anæsthesia, and the rapid action of the gas. The injection of cocaine into the spinal canal, termed subarachnoid, or rhachidian, or medullary anæsthesia, is supplanting general anæsthesia in many cases. This process causes loss of sensation of feeling and of pain over a large area of the body, without the abolishment of consciousness. This method was suggested by Dr. J. Leonard Corning, of New York, who demonstrated its possibility in 1885. Professor Bier, of Kiel, revived the procedure in 1899, and Professor Tuffier, of Paris, adopted it enthusiastically in the same year. In securing this medullary anæsthesia the solution of cocaine is thrown into the fluid in the spinal cord canal by means of a long hypodermic needle, inserted generally between the second and third lumbar vertebrae. While by this method there is no effect on the heart, respiratory tract, or kidneys, no danger from pneumonia in the aged or feeble, less nausea and vomiting, all of which occur as concomitants of ether anæsthesia, yet severe headache, vertigo, cyanosis, rise of temperature, weakness and loss of sphincter control may ensue, and most of these unpleasant conditions may last for a week. Mintz, of Moscow, suggests injecting a solution of sodium bromide with that of cocaine, a method by which he secured alleviation of the unpleasant symptoms following the analgesia. European obstetricians have had better results in the use of medullary anæsthesia with women in labor than American physicians. The ninth and final report of the committee on anæsthesia, appointed ten years ago by the British Medical Association, was published in 1901. Of 25,920 cases of anæsthesia in hospital and private practice, 13,393 were cases of chloroform anæsthesia; 4,595 of ether; 2,911 of nitrous oxide; 2,071 of nitrous oxide and ether; 678 of "A. C. E. mixture" (alcohol, chloroform, and ether); and the rest various combinations. The analysis of their figures shows that chloroform anæsthesia was responsible for 78 cases of danger (including death), or 0.582 per cent. of the cases, while ether was responsible for but 3 danger cases, or 0.065 per cent.

ANAM or ANNAM, a French dependency on the China Sea, extending from Tonquin on the north to Cambodia and Cochin-China on the south, forms a division of the French colony of Indo-China. The estimated area is 88,780 square miles and the estimated population 6,000,000. The capital is Hué, population about 30,000. Anam is a protected native state which has been under French control since 1884. The administration, while nominally in the hands of a king and his officials, is supervised by the French resident, and the customs and finances are under the management of French officers. The local budget for 1900 balanced at 2,120,016 piastres, and the expenditures of France, on Anam and Tonquin combined, according to the budget of 1901, was 1,084,913 francs. Among the products

are rice, maize, and other cereals, cinnamon, sugar, betel, tobacco, and bamboo. Raw silk, coarse crêpe, and earthenware are manufactured. The principal imports are cotton goods, tea, petroleum, paper, and tobacco; the chief exports, cinnamon and sugar. In 1899 the imports were valued at 4,100,000 francs and the exports 6,500,000 francs. In 1900 a contract was made for the construction of a railway from Hué to Turan, a port about 50 miles to the south. See **INDO-CHINA**.

ANARCHY. The word "anarchy" is usually construed literally to denote a state of lawlessness; it is also used broadly and interchangeably with "anarchism" to define a series of allied theories in economic, political, and social science, of which the basic principle is the right of the individual to personal well-being, freedom from civil authority, and liberty of action in all social relations. As this idea of "individual rights," characterizing the entire group of theories, is or is not pushed toward its ultimate logical conclusion, the resultant theoretical system vacillates between that fanatical position where every man's hand is necessarily raised against every other, and those milder and long-held philosophical beliefs that the authority of society over the individual should be restricted within the narrowest limits requisite to preserve the social order. The several graduations by which the extreme belief defined correctly as anarchism merges into a tenable politico-philosophical concept are very numerous and have all had able defenders. Anarchism proper, on the other hand, has rarely been defended by thinkers of ability, for the reason that this belief constitutes in effect a protest against sentient life itself, this protest following from the fact that the history of civilization demonstrates conclusively that sentient life, both in its bulk amount and in its higher degrees of complexity, is absolutely dependent upon restraints imposed by every individual upon every other, that is to say briefly, upon the maintenance of social and governmental authority. Deriving their name from anarchism and endeavoring to defend their actions by that theory, there have been organized mainly, during the nineteenth century, small and generally unconnected bodies of men and women, principally in Europe, who have fostered and disseminated the most extreme anarchistic beliefs, and have in some instances incited their members to crime against those in authority in the State. Quite as often, however, so-called anarchistic crimes have been committed by single individuals, disowned by the anarchistic bodies proper, and endeavoring only from special personal reasons to put into effect the logical conclusion of the anarchistic belief. It is against these sporadic anarchists, quite as much as against the organized associations of anarchists, that restrictive measures have been devised in Europe.

The assassination of President McKinley (see **McKINLEY, WILLIAM**) on September 6, by Leon Czolgosz, an anarchist and a disciple of the notorious anarchist preacher and teacher, Emma Goldman, aroused an immediate and at the time passionate demand in the United States that Congress should enact laws at its next session sufficient to suppress the entire anarchistic brood throughout the country. It was pointed out that three presidents had been assassinated in thirty-six years—Lincoln in 1865, Garfield in 1881, and McKinley in 1901; that nests of avowed anarchists had existed for years undisturbed by State or national authority, in Paterson, N. J., in Chicago, Ill., and in other places; that hundreds of well-known anarchists, driven from European countries, were coming annually to the United States without let or hindrance; that every other great civilized country had devised the most stringent measures to suppress, expel, and punish anarchists, and still there was not a line on the statute books of the United States inimical to anarchists; and among the class of undesirable aliens which could be excluded from the United States under the immigration laws, anarchists were not included, the list being confined to "convicts, lunatics, idiots, and persons liable to become a public charge." To remedy this state of affairs, various and drastic measures were proposed, those most prominently advocated being (1) to prohibit all aliens known as anarchists from landing in the United States; (2) to deport all aliens and even naturalized citizens who subsequently became anarchists; (3) to suppress anarchistic societies, interdict their meetings, and punish their members; (4) to prohibit such scurrilous newspaper criticism of the government and of the President as might cause violent political feeling likely to incite light-headed persons to crime; (5) to surround the President with some more efficient bodyguard than one or two secret service men and the assumed goodwill of all people; and (6) to give to the federal government jurisdiction over criminal assaults upon the President and other high officials, and ambassadors and ministers of foreign governments, instead of, as at present, leaving the punishment of these crimes to the States in which they may be committed.

To the last of these proposed measures an almost spontaneous approval was given, both directly after President McKinley's assassination, when excitement ruled high, and at a later period, when a more critical spirit had begun to question the wisdom of some of the other recommended legislation. For it was recognized that whatever means of preventing anarchistic crime were finally judged to

be best, the punishment of anarchists at least should lie with the national authority against which the attack had been primarily made. Moreover, not every State could be depended upon to conduct a trial of worldwide interest with the sureness and swiftness of verdict that had characterized the trial of Czolgosz in New York. And for that reason, as well as because they properly belonged to the government, such cases should be vested in the federal courts alone. The other proposals, dealing in general not with the punishment but with the methods of preventing anarchistic crime, and endeavoring to legislate, as it were, against a frame of mind rather than against an overt act, opened up to discussion a series of vexed questions. For if the measures devised were to be aimed solely against anarchists, it might be said that the greatest danger did not lie there, two Presidents having been assassinated by men who were not anarchists, and the assassination of President McKinley by an anarchist being unique in the history of the country. Again, if the legislation proposed should be directed against the immigration of secretly plotting anarchists, it might be answered *a posteriori*, and judging by a single instance, that this would be of little avail, for Czolgosz was a native-born American. Or, if avowed and notorious anarchists were to be debarred from the United States, then the immunity obtained would seem still more doubtful, for it was a fact attested by the prolonged and bitter experience of Europe that the talking and preaching anarchist was a most harmless creature, amorous not of felling crowned heads but filling sheets of paper and of entertaining large audiences; it was rather the silent fanatic anarchist, unknown to the police, often low in the councils of his fellows, who could not be guarded against and who was to be feared. Again, if repressive measures were taken against anarchists wherever found, their meetings broken up and their members imprisoned, would not a more dangerous, because a more secret, form of anarchism ensue? "After the Barcelona outrages," the Duke of Arcos stated in the *North American Review*, "Spain adopted the most drastic measures in the hope that assassination could be stamped out. It was provided that any man responsible for explosions likely to cause death or serious bodily injury should be executed or sentenced to penal servitude for life. Severe sentences were provided for all persons, and especially newspaper editors, who advocated or condoned bomb-throwing. Anarchist societies were declared illegal, and the government was empowered to dissolve them wherever found. Trial in each case was to be by court-martial, in order to secure more expeditious punishment. All these measures had little or no effect. Almost on top of them came repeated new attempts, the record of recklessness being finally topped with the assassination of Canovas in 1897 by the anarchist Augiolilio." Finally, if military instead of legislative means of preventing assassination were taken, would the case stand better? In Europe, where all the resources of the military and secret service arms were employed to this end, assassinations and wholesale murders by bomb-throwing and otherwise were far more frequent than in the United States, and President Carnot of France was murdered while surrounded by a regiment of cavalry.

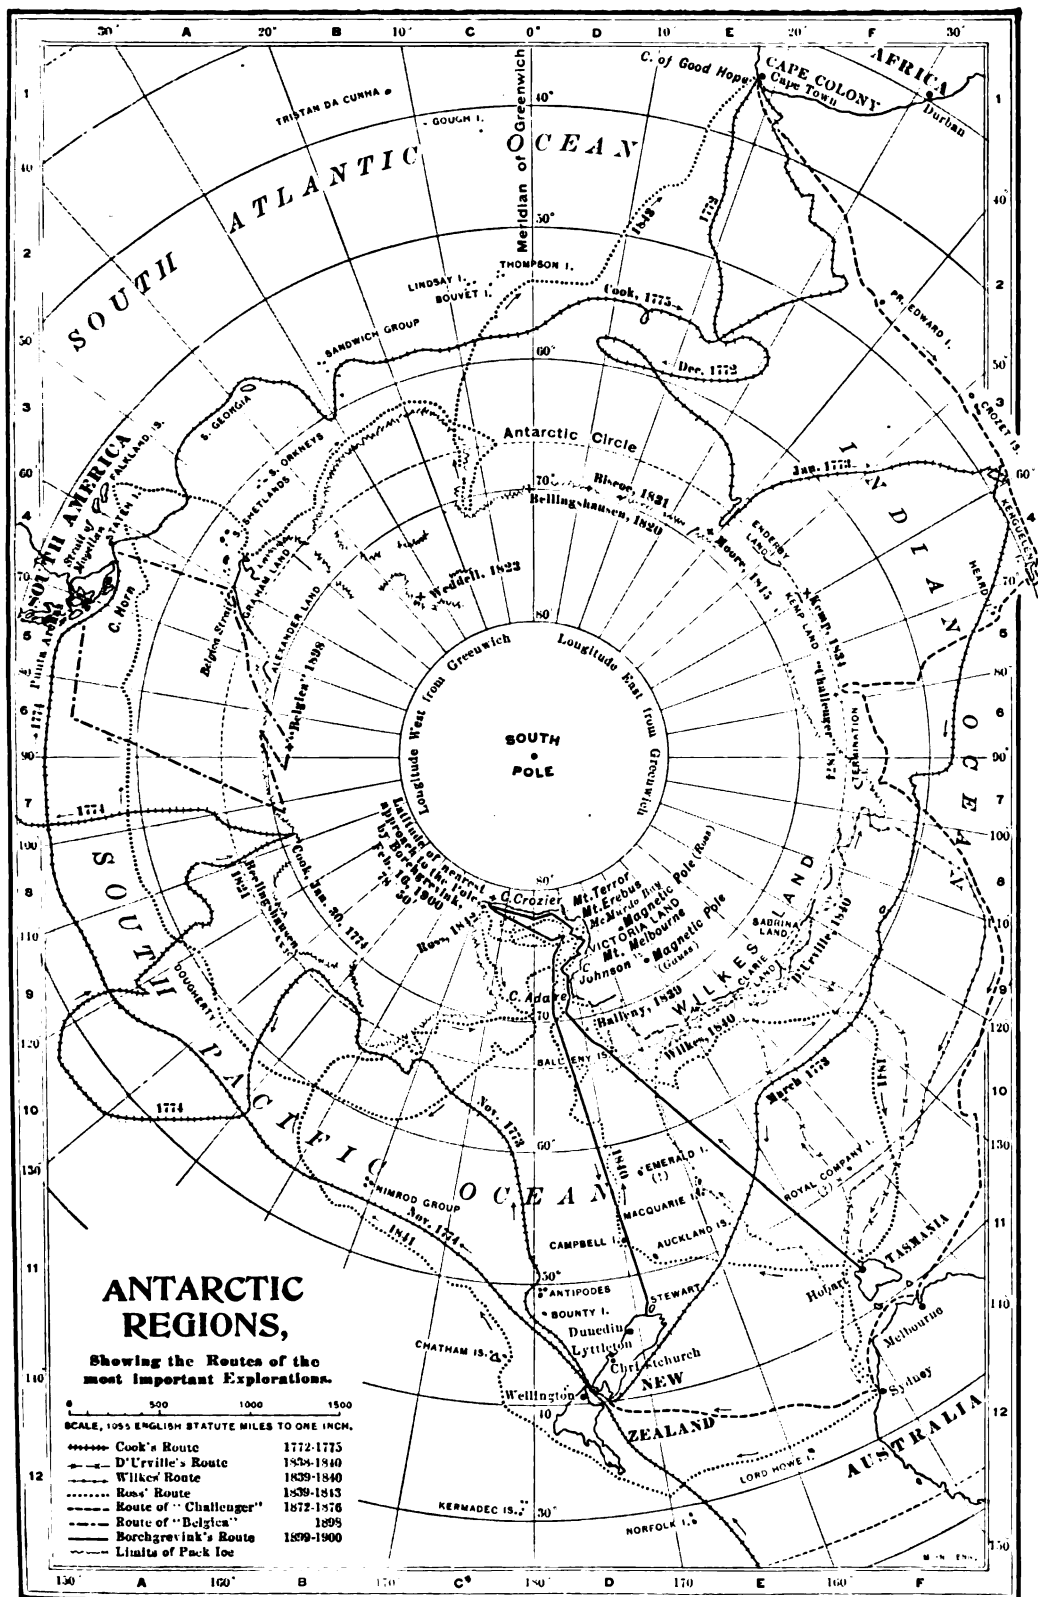

Besides these objections questioning the especial value of preventive measures against anarchistic outbreaks, other objections were advanced against them, based on the traditions and political genius of the United States. The right of free speech and all that that connotes was stated to be the basis upon which the civil institutions of the country were built up; and although this right might be so thoroughly abused as directly to incite crime and force the authorities to take action, as when the anarchists Johann Most and Emma Goldman were convicted under the laws of New York, a general federal statute delimiting the bounds of writing and speech-making would operate under this great disadvantage, that in all cases not absolutely clear, and especially if partisan political feeling happened to run high at the time and was in any way involved, acrimonious accusations would certainly be brought forward of laws bent to party use and of constitutional powers exceeded. How great a political feud might be engendered thereby was shown at the time of the arrest of Vallandigham by the military authorities during the civil war. How likely such a feud would be to arise unless the government acted with great discretion in moments of extreme provocation sure to come, might be judged from the fact that after President McKinley's death a set of daily papers which had been bitterly opposed to the President's administration were somewhat roundly accused of having been almost as morally criminal in their utterances as Emma Goldman was in hers, and it was asserted that the further publication of such personal political utterances should be stopped. But if before President McKinley's death Congress had passed a law authorizing the government to interdict such publications, and they had been interdicted, political dissensions of the gravest consequence would have been sown throughout the country. Two further arguments, based upon phenomena observed in the history of anarchism in Europe, were brought forward by those opposing drastic government measures to suppress

anarchists. The first of these, already alluded to, was that no sooner were open advocates of anarchism reduced to silence than a secret and more dangerous band took their place, glorying in their outlawry, fanned with its excitement, and prepared for any desperate measures on a wholesale scale that would secure them what they considered a martyr's death. The other fact observed about the anarchist was that he was almost invariably a person of the peasant class, educated above his station, and unable to realize his ideas and ideals in the plane to which he was almost necessarily limited. Given a prior tendency to emotionalism therefore, his crude and general notions unmodified by experience, almost naturally and unconsciously centred in the social system and in the desirability of overthrowing it. As the fundamental cause of anarchy, then, was the vivid contrast afforded by living in one condition of life, and appreciating, or rather over-appreciating, another and better condition and being unable to attain it, so it would seem that the rational cure for anarchism lay in the increase of general education, the increase of material well-being, and permission to all men to take part in the seemingly plumed and haughty government which was aimed against; at the same time keeping the plumes and hauteur so far in the background as the necessity of preserving public order permitted. Not only would this appear to be the rational cure for anarchism, but it was the traditional policy of the United States upon which its democratic institutions were founded, and by whose influence the turbulent and dangerous political elements mixed among the half million of emigrants who came to the United States yearly had become peaceable and well-ordered citizens. But if measures for the active repression of anarchists, such as would tend to turn American political institutions back to the type of those in Europe and would ultimately necessitate a large armed force within the country, should not be taken, at least it was conceded that there was no reason why the United States should not exercise the right exercised by every other government, and debar from the United States all those whom it deemed would make undesirable citizens; and in this class anarchists ought certainly to be included. For though their teachings were in general at once harmless and futile, yet, as shown in the case of Czigosz, they were not always so. And while a federal law hedging around in any way freedom of speech in the country might give rise to worse ills than it cured, the United States was by no means obligated to encourage wild and dangerous teaching by inviting the advocates of anarchism to make a home in this country.

ANDREW AND PHILIP, BROTHERHOOD OF, is an interdenominational order, founded in 1888, the object of which is the "spread of the kingdom of Christ among men." Its membership, distributed in more than twenty denominations and extending beyond the United States, numbers in this country 15,000 enrolled in 550 chapters. The federal convention in the fall of 1901 was held in Pittsburg, Pa. The organization publishes the *Brotherhood Star*. President, Dr. Rufus W. Miller; secretary, Rev. J. G. Hamner, Newark, N. J.

ANGLICAN CHURCH, otherwise called the Anglo-Catholic Church, is a term applied particularly to the Church of England, but includes in a general sense Protestant Episcopal churches in all lands which are derived from the established church of England. See **ENGLAND, CHURCH OF**; **IRELAND, CHURCH OF**; **SCOTLAND, CHURCH OF**; and **PROTESTANT EPISCOPAL CHURCH**.

ANGOLA, OR PORTUGUESE WEST AFRICA, a dependency of Portugal, bordering on the Atlantic for over 1,000 miles from the Congo Free State to German Southwest Africa. The estimated area is 484,000 square miles and the estimated population 4,119,000. The seat of government is the port of St. Paul de Loanda; the administration is in the hands of a governor and his subordinates appointed by the crown. The estimated revenue and expenditure in milreis (\$1.08) for the fiscal year 1900 were 1,673,111 and 2,013,671 respectively. The principal products include coffee, rubber, vegetable oils, wax, ivory, cattle, fish, cocoanuts, and sugar. The reported imports and exports in 1899 amounted to 6,314,846 milreis and 7,035,414 milreis respectively. The exports are largely taken by Portugal; the imports are supplied chiefly by Great Britain and Germany, the latter being now in the ascendancy. Economic conditions, however, were critical in 1901; the tariff of 1892 had proved disastrous to the colony, being advantageous to only a few Portuguese merchants and the owners of the line of steamers plying between Angola and the mother country. A railway is in operation from St. Paul de Loanda to the Lucalla River, 225 miles; an extension of about 124 miles was projected in 1901. A railway, about 20 miles in length, connects Benguella with Katumbella. In 1901 the construction of a railway from Benguella to Bihe was begun. According to a statement in the *Brussels Gazette Coloniale*, in April, 1901, the telegraph system of Angola was extended 1,000 miles during 1900. Among the present lines are those connecting Loanda with the Congo and with Novo

Redondo; a line from Mossamedes to Humpasa, 134 miles; Humpasa to Chibia, 30 miles; Dondo to Malange, 153 miles; Quinzau to the Congo, 135 miles. In 1901 a line from Novo Redondo to Dondo, 152 miles, was nearly completed.

In August, 1901, the British and Portuguese governments reached an agreement with regard to the undefined boundary between Angola and Barotseland, intrusting the delimitation of the frontier to a mixed Anglo-Portuguese commission.

According to a British consular report, the sale of alcoholic liquors in Angola has had a terrible effect on the natives; there seems to be little likelihood of abating the evil, since the rum industry is a large source of revenue to the colony. During 1901 the sleeping sickness continued its ravages. It has interfered seriously with industry; for example, the report just mentioned stated: "The margins of the River Coanza, which a few years ago were thickly populated, may now be traversed for hours without encountering a single native hut on shore or a canoe on the river. Whole villages, which a few years ago met the eye of the traveler by the railway, have entirely disappeared, due to the sleeping sickness."

ANTARCTIC EXPLORATION. The objects of the three Antarctic expeditions which set forth in 1901 are altogether scientific. There is not even a hint in the published plans of any of them that such a dramatic project as the discovery of the south pole is contemplated. In this regard, the plans of the Antarctic leaders are in sharp contrast with the plans of the Arctic leaders, who have frankly announced that their main object is the achievement of the adventure of the north pole, and that the collection of scientific data is merely incidental.

For about a quarter of a century scientific men have been importuning governments to send expeditions into the Antarctic regions. This modern agitation in favor of Antarctic exploration was begun by Dr. Neumeyer, was fostered by Dr. Petermann, of *Petermann's Mitteilungen*, by Dr. John Murray (now Sir John Murray), president of the Scottish Geographical Society, and a member of the *Challenger* expedition, and finally by Sir Clements R. Markham, president of the Royal Geographical Society. The interest of scientific men in Antarctic problems culminated in 1901 in the despatch to the south of an English expedition, a German expedition—both organized partly under government auspices—and a Swedish expedition, supported by private subscription, and besides these, in the promise of a Scottish expedition to the same region in 1902.

The Antarctic Problem.—Very little is known about the Antarctic regions. Before the Belgian expedition of '98-'99, no man had passed a winter south of the Antarctic circle, and fifty-five years had elapsed since a strictly scientific party had seen the Antarctic land, although the *Challenger* expedition crossed the Antarctic circle. Whether or no Wilkes Land and Victoria Land below Australia, Graham Land below South America, and the little Enderby Land below the Indian Ocean all extend south and unite in a continent, has not been ascertained. The supposition is that an Antarctic continent exists, but that has not been proved. Geographers are interested in this problem. Of course the interior conditions of such a continent, if it does exist, are unknown. It is probable that a vast ice-cap covers the whole region; and if this theory is borne out by the facts, the ice-cap is probably more like that which covered the northern part of North America during the glacial epoch than is the ice-cap of Greenland. Geologists are, therefore, interested in the phenomena of this great glacier, as well as in the character of the rock which has been discovered along the coast. Meteorologists are interested in the wind currents. The theory that a great anti-cyclone of northerly winds sweeps from the South polar regions has been advanced, but remains in doubt. These are geodetic problems to be solved. The land fauna and flora are known to be meagre, but their extent has not yet been determined. The investigations of the *Challenger*, however, and of other expeditions in the South seas had demonstrated that this region is exceedingly rich in sea life; and a prominent feature in the plans of all the expeditions is dredging at various depths. See ZOOLOGICAL EXPEDITIONS AND STATIONS.

The main problem to be solved, however, is that of terrestrial magnetism. The southern magnetic pole has not yet been definitely located, and until observations of the regions south of Cape Horn shall have been taken, the whole science of terrestrial magnetism remains at a standstill. There is, moreover, a direct commercial as well as scientific need for magnetic observations below the 40th parallel in the Indian Ocean. Vessels crossing from Cape Town to Australia have passed through regions of high magnetic activity, which have caused deviation in their compasses and thus thrown the ships off their course. Two of the expeditions go out with instructions to ascertain the exact localities in which this activity exists, and to determine, so far as may be possible, the conditions which govern it. Magnetic observations, then, are the main feature of all the expeditions, and in addition the Argentine Republic

has promised to establish a magnetic observatory on Staten Island, south of Cape Horn.

By agreement, the Antarctic regions have been divided, for purposes of exploration, among the nations. The best known region, Victoria Land, below New Zealand, has been selected by the British. The less known region, south of the Indian Ocean, has fallen to the lot of the Germans, and the Swedes have put up with Graham Land, which is furthest from the magnetic pole, and the most northerly of the coasts.

The National Antarctic Expedition.—The expedition organized by the British sets forth under the auspices of the Royal Society and the Royal Geographical Society, which raised most of the funds. In all, £100,000 was collected, of which the government contributed £45,000. About fifty thousand pounds of this money was spent in building and equipping the steamship *Discovery*, a barque-rigged vessel, 172 feet long, 33 feet beam and 16 feet draft. She is fortified with bulkheads and beams to resist ice-pressures, and is sheathed with greenheart, protected at the bow with metal plates. Her triple-expansion engines develop 570 horse-power. She is fitted out with a magnetic room, in the vicinity of which no iron was used in her construction, and with commodious laboratories for the use of the scientific staff. She is equipped with an electric-light plant, charged by a dynamo, which is to be worked in winter by a windmill. To keep out the cold, she has an asbestos lining an inch and a half thick, and a system of compartments, differently heated, separates her cabins from the open air.

The commander of the expedition is Capt. R. F. Scott, a torpedo-lieutenant in the British Navy. He will have charge of the magnetic observations. The meteorological observations will be in charge of Lieut. A. R. Armitage, R. N. R., the executive officer. The civilian staff consists of Dr. George Murray, the scientific director, T. V. Hodgson, biologist, William Shackleton, physicist, R. Koeltitz, botanist, and E. A. Wilson, geologist. All collections, logs, journals, charts, drawings, photographs, observations and scientific data are to be the joint property of the two societies. The commander is instructed to afford the scientific staff every opportunity to make observations and collections.

The objects of the expedition, as outlined in the instructions to Captain Scott, are (a) "to determine, as far as possible, the nature, condition and extent of that portion of the south polar lands which is included in the scope of your expedition; and (b) to make a magnetic survey in the southern regions to the south of the 40th parallel, and to carry on meteorological, oceanographic, geological, biological, and physical investigations and researches. Neither of the objects to be sacrificed to the other."

The commander was instructed to establish a magnetic station at either Melbourne, Australia, or Lyttleton, New Zealand, and to carry a magnetic survey from the Cape of Good Hope, south of the 40th parallel, to this station and again across the Pacific to the meridian of Greenwich. A sub-station was to be established, if possible, in Victoria Land, whither the *Discovery* was to proceed from the primary station. It was hoped that she could pass through the ice-pack north of Victoria Land in December, so that she might spend the Antarctic summer in finding a suitable spot for winter quarters. Winter quarters were to be established somewhere between Cape Johnson, north of Wood Bay ($74^{\circ} 25' S.$), and Cape Crozier, at the foot of Mount Terror. The expedition was then to examine the great ice-barrier discovered by Ross in 1842. This barrier presents a solid front of ice, rising 250 feet above the water. Ross followed it from Cape Crozier more than two hundred and fifty miles, and did not come to the end. Scientific men are not agreed as to whether it is the side of a long glacier, flowing down from the high land in that region, or whether it is the front of a wide glacier proceeding northward from a low, level country. Investigation of this mass of ice is to be the summer work of the expedition.

The winter party is then to be made comfortable on shore. Whether or no the *Discovery* is to return to open water or remain near the headquarters throughout the winter, is left to the discretion of Captain Scott. If she does not stay, she is to leave the scientific director, the physicist, a surgeon and men enough for sledge parties, furnished with provisions for three years. The three main sledge parties are instructed (1) to examine the volcanic regions near Mount Erebus, (2) to proceed southward as far as possible, and, most important, (3) to proceed westward between Capes Gauss and Washington toward the magnetic pole. If Captain Scott decides to winter his ship in the ice, it is reasoned that she should be able to force her way northward through the pack early in 1903, and in that case the leader is to proceed with his survey across the Pacific before returning to England.

The *Discovery* was launched March 21. She left the Thames for Cowes July 31. At Cowes, the King, the Queen and the Princess Victoria inspected her, and the King decorated the commander with the Victorian order. She sailed at noon August 6 for Cape Town, where she arrived October 3. She abandoned her trip to Melbourne, and instead proceeded to Lyttleton, New Zealand, touching on the way at

ANTARCTIC EXPLORATION.—Dr. Erich von Drygalski and the Crew of the *Gauß*.

Macquarie Island. She reached Lyttleton November 28, leaking badly, and was dry-docked. In dry dock she was caulked all over and launched December 16. Then it was found that she still leaked, forward under the iron sheathing; but the leak was not deemed important, and therefore she sailed December 21 from Lyttleton for Victoria Land. The last news of her was a telegram of farewell sent by Captain Scott from Port Chalmers, December 24.

The German Antarctic Expedition.—The German expedition is to cooperate with the British. It will cross the Antarctic circle somewhere below the Indian Ocean. Its primary magnetic base will be Kerguelen Island. At Three Island Harbor, in Royal Sound, it will establish an observatory. There five men will be left—a biologist, a magnetic observer, a meteorologist, and two sailors. Thence the expedition will steam southward and attempt to establish a station in some Antarctic land. Very little is known about the Antarctic region south of Kerguelen Island, but the Germans hope to reach the west coast of Victoria Land, and thence to sledge overland toward the magnetic pole. Their operations are not as clearly defined as those of the British; but June, 1904, has been fixed for their latest return to some seaport in communication with Germany. If no tidings shall have come from them by that time, a relief expedition will be sent out.

The funds for the German expedition have been supplied, partly by government appropriation and partly by private subscription. Through the influence of Count von Posadowsky-Wehner, secretary of state of the interior, the *Reichstag* appropriated about 40,000 marks for the expedition. The rest of the funds were raised by private subscription. A vessel was built expressly for Antarctic work and was launched April 2. She was named the *Gauss*, after the eminent mathematician whose work on *Terrestrial Navigation*, published in 1838, was the main stimulus to scientific investigation in the Antarctic regions. The *Gauss* is 151 feet long, 35 feet beam, and draws 16 feet; she displaces 450 tons. She is a three-masted schooner, fitted with triple-expansion engines which give her a speed of seven knots. Her lines are somewhat like those of the *Fram*. She is heated by steam and lighted by electricity.

The equipment of this expedition comprises provisions for three years, a wind-mill, a captive balloon, a naphtha launch, kites for meteorological work and outfits for observations in geodesy, magnetism, zoology—including dredges—meteorology, etc. Sledge journeys are to be a feature of the expedition, and fifty dogs have been supplied. The expedition is under the command of Erik von Drygalski, who will conduct the geological work. The scientific staff is made up of Dr. Ernst von Hoeffen, zoologist and botanist; Dr. Hans Gazert, medical officer and bacteriologist; Dr. Emil Philippi, geologist and chemist; Dr. Friedrich Bidlingmaier, magnetician and meteorologist. Their collections are to be the property of the German empire. The commander of the ship is Captain Hans Rusch, a captain of the Hamburg-American Line, and the engineer is A. Staho, who is also in the service of this line. The expedition numbers 32 men. The *Gauss* sailed from Kiel August 11, and arrived at Cape Town November 23, whence she started for Kerguelen Island.

The Swedish Expedition.—This expedition, organized and led by Dr. Otto Nordenskjöld, will establish a station, if possible, on the west coast of Graham Land, where the leader and the scientific staff are to pass the winter, sending their vessel meanwhile to make observations in the open water north of the pack. The funds are subscribed by private subscription, and the entire expenses are to be about \$35,000. The leader is a nephew of the famous Baron Nordenskjöld (*q.v.*), who made the first voyage around the northern extremity of Asia. Among the members of his staff is Mr. F. W. Stokes, artist of the Peary relief expedition of '92, and again of the Peary expedition of '93-'94. He is the only American who takes part in the Antarctic exploration of 1901. The expedition bought the steam-whaler *Antarctic*, which was used in Herr Bull's expedition, from which was made the first landing on the Antarctic continent. She was then officially in the whaling service. She was afterwards purchased by Professor Nathorst for his search expedition for Andrée, and then was bought by the Danish government for the expedition of Lieut. Amdrup. She is commanded by Captain Larsen, who has made several voyages to Graham Land. The expedition comprises 26 men, including a geologist, two biologists, a surgeon and observers of hydrographical magnetic meteorological and geographical phenomena. The *Antarctic* left Gutenberg October 16 and reached Buenos Ayres, whence she sailed for the Falkland Islands, December 20.

Delays in Sailing.—All these expeditions set forth from their bases rather late in the year, and there was a question among Arctic authorities whether they would accomplish during the Antarctic summer months of December, January, and February all that they have undertaken to do.

Plans of the Scottish Expedition.—Mr. W. S. Bruce, who visited the Antarctic regions in '92 in a whaling steamer, has made the announcement that in 1902 he will take the field in a whaler of 500 tons for exploration of the Weddell Sea, a region where in 1823, Captain Weddell penetrated below the 74th parallel and still saw an

ice-free ocean beyond him. The funds for this expedition, which is to cost £35,000, are to be obtained from private subscription. Mr. Bruce's plan is to cooperate with the other expeditions by establishing a scientific station in South Georgia. Thence his ship will proceed as far south as possible along the thirtieth degree of west longitude, but she will not winter in the ice. If land should be found Mr. Bruce might leave a party to make a sledge journey southward, but he proposes to send his ship into free water before the frozen season. The number of his party has not yet been announced, but his scientific staff will consist of five men. He has bought the steamship *Hecla*, which is being refitted by G. L. Watson, the designer of yachts.

ANTHRAX, or Malignant Pustule, is a rare disease in this country. It usually attacks those who handle hides, in which the anthrax bacillus is sometimes found. Gaining access to a hair-follicle or a sweat-gland, the micro-organism becomes the progenitor of a colony of bacilli, from which a specially virulent toxin is taken up by the blood. A small pimple appears, then the surrounding surface becomes red or purple, suppuration commences, and usually the patient dies in two or three days, suffering intense pain. Two cases of fatal anthrax occurred in November, 1901, in Hillsgrove, Pa., the victims being teamsters who were employed in hauling hides for a tanning company. Niemtschenkoff, in *Medicinskoie Obosrenie* for February, 1901, reports a case of anthrax, situated on the cheek, accompanied by great infiltration and severe systemic manifestations, which was cured by large injections of a 5-per-cent. solution of carbolic acid into the face. See **SERUM THERAPY**.

ANTHROPOLOGY. See **INDIANS**.

ANTICELTINA is a new compound formed by the union of urea with mercury, in the proportions of 43 per cent. to 4 per cent. It resembles bichloride of mercury in its effects, though painless when applied to the conjunctiva in a 1 to 2,000 solution. It has been used by Andreocci, Francaviglia and Capparelli in infective keratitis and iritis by subconjunctival injection.

ANTIMONY. The quantity of antimony produced from domestic ores in 1900 amounted to 151 short tons, valued at \$27,180, as compared with 243 short tons, valued at \$43,600 in 1899. The amount of metallic antimony produced by the smelters in the United States from both foreign and domestic ores in 1900 amounted to 1,750 tons, valued at \$346,980, as against 1,275 tons, valued at \$251,875, in 1899. This quantity represents about half of the amount actually consumed in the United States, the imports in 1900 amounting to 1,827 short tons, valued at \$287,937. The imported material was either in the form of crude antimony or regulus. The price of antimony in 1900 ranged from 9½ to 10 cents a pound for Hallett's brand and 10½ to 11 cents for Cookson's brand.

ANTITOXIN. Accompanying the development of certain bacteria in the body of man, during the progress of certain diseases, poisonous principles called toxins are thrown off by the bacteria or exist in the bodies of the bacteria. In nature's effort to combat these principles, substances are produced in the serum of the blood termed antitoxins, which neutralize the toxins. Antitoxins continue for a considerable period in the blood of individuals who have recovered from these germ diseases; and the serum of their blood may be used in inoculating others who are ill with the same diseases, to fortify them against the toxins which are at work. Several such antidotal serums have been isolated and verified, and are prepared for use in treating various diseases. (See **SERUM THERAPY**.) The first serum of this class in common use was the antidiphtheritic antitoxin, which has been widely though inaccurately known simply as antitoxin. Physicians in Paris hospitals have been experimenting with diphtheria antitoxin in enormous doses, in cases of pneumonia. The results in fifty cases, as reported by Talamon in March, 1901, have been very favorable; the duration of the pneumonia having been diminished, the chance of complications lessened, and the mortality lowered 10 per cent. In 25 cases, treated with the serum before the fifth day of the disease, but one death occurred, and this was a patient aged 72 years.

ANTIVIVISECTIONISTS. See **VIVISECTION**.

ARABIA, a peninsula in southwestern Asia, has an area estimated at from 1,000,000 to 1,230,000 square miles, and a population from 4,000,000 to 12,000,000, the lower estimates with regard to the inhabitants probably being the more nearly correct. The vilayets of Hedjaz (about 96,500 square miles) and Yemen (about 77,000 square miles) on the Red Sea are a part of Asiatic Turkey, and a strip along the Persian Gulf, extending as far south as Oman, and known as El Haza, is nominally under Ottoman authority. Aden (*q.v.*) in the south is a dependency of the British Bombay government, and Oman in the southwest, on the Persian Gulf and Arabian Sea, is an independent state, but under British influence. The interior is inhabited by tribes which acknowledge no rulers other than their own chieftains.

Hedjaz and Yemen have estimated populations of 300,000 and 750,000 respectively. In 1897 the trade, mainly imports, at the port of Jeddah amounted to about \$3,240,000; at the port of Hodeida, about \$6,900,000. A railway is being constructed from Damascus to Mecca, and in September, 1901, 80 kilometers had been laid. It is expected that this line will be connected with the Bagdad railway (German) now building. It is feared that opposition of the Arab tribesmen will cause considerable difficulty in the construction of the line, for before the end of 1901 they had repeatedly destroyed parts of the telegraph line that the Turkish authorities are carrying to Hodeida on the coast of Yemen. Oman has an estimated area of 82,000 square miles, and an estimated population of 1,500,000. The sultan is Seyyid Feysal bin Turki, whose seat of government is Muscat. A British political agent resides here. For the commercial year 1900 the imports were valued at 2,600,720 dollars and the exports 1,533,300. (The dollar is worth about 50 cents.) The principal imports were: Rice, 810,000 dollars; arms and ammunition, 445,150 dollars; grain, 244,670 dollars; and piece goods, 224,000 dollars. The leading exports were: Dates, 630,200 dollars, and cotton fabrics, 159,000 dollars. Over 80 per cent. of the trade is with India and Great Britain.

The Troubles in Koweyt.—Koweyt is a town on a bay at the head of the Persian Gulf, 80 miles south of Basra. In April, 1901, there was a report, afterwards confirmed, that Mubarakh, the sheikh of Koweyt, had been defeated in battle by Ibn Rashid, sultan of Nejd, central Arabia, whom shortly before he had deposed. The report stated that 5,000 men fell in the battle. Down to 1870 Koweyt was really, if not formally, independent, and even since that year the sheikh has not acknowledged the political, but only the religious, authority of the Ottoman government. For some reason, probably with the hope of increasing his inadequate revenues, the Turkish Sultan seized the opportunity, after the sheikh's defeat, to attempt the establishment of formal authority in Koweyt. Mubarakh seemed to realize this design when in June, 1901, upon stating his intention of continuing hostilities with the ruler of Nejd, he declined to accept the assistance of Turkish troops and asked for a proclamation of British protection. There were a number of Turkish troops at Basra, but it appears that these could not easily advance against Koweyt by land; accordingly an attempt was made by sea, but the landing of the troops was frustrated (August 24) by the menacing presence of a British gunboat. In September, Turkey was reported to have 30,000 troops in Basra; these, it was said, were intended to march across Arabia in order to suppress disaffection in Yemen, but the explanation was not taken seriously. By the middle of October, 1901, the Nejd tribesmen were ceasing to menace Koweyt and the situation in general was reported to be quiet, but late in December the whole question was reopened. It was then announced that the Sultan of Turkey had sent a special emissary to Koweyt to summon Mubarakh to Constantinople to make obeisance to him as his suzerain. The Sultan promised various honors to the sheikh on his compliance with the summons, but threatened to remove him should he refuse. The sheikh, it was reported, fearing such an order, refused to allow the emissary to land. He was probably aware that "many have been called to Constantinople and received with hospitality so profuse and prolonged that they have never had an opportunity to enjoy their honors among their own people." It is not improbable that the Sultan's power to remove the sheikh is inadequate. About the same time it appeared that Ibn Rashid, the sultan of Nejd, had made preparations to renew his attack upon Koweyt in the interests of Turkey, and accordingly Mubarakh had appealed again for British protection. British vessels in the Persian Gulf seemed able to maintain the *status quo*, the continued existence of which the British government seems determined upon; for, though Koweyt is of no agricultural and little commercial importance, it has a real value on account of its position as a possible naval base. It was surprising that the Sultan, even though greatly in need of additional tribute, should attempt to exercise any constraint upon Mubarakh (and thus antagonize British interests), over whom his suzerainty is merely nominal, at a time when the Porte was experiencing many troubles of an exceedingly serious nature. Turkey had just received a severe lesson from France, friction with the United States seemed possible, the attitude of Bulgaria was discontented, not to say menacing, and open anarchy prevailed to a considerable extent in various parts of the empire—in Macedonia, Albania, Armenia, and to some extent on the Red Sea littoral. In December, 1901, the rumor that Great Britain was about to declare a protectorate over Koweyt called forth unfavorable comment in the German and Russian press. Since Koweyt will probably be the southern terminus of the Bagdad railway (German), Germany is decidedly opposed to its possession passing to Great Britain. For the question of Russian influence in the Persian Gulf, see PERSIA (paragraphs on History).

ARABI PASHA. See EGYPT.

ARBITRATION, INTERNATIONAL. While no international disputes of great importance were decided by, or referred to arbitration during the year 1901,

still the "arbitration idea" has become more generally recognized by statesmen and diplomats than ever before. The permanent international laws of arbitration, proposed by the Hague Conference of 1899, came into existence with the ratification of the conference's action in 1900, and the subsequent appointment of members by the fifteen signatory powers. On April 14, 1901, Dr. W. H. de Beaufort, the Netherlands minister for foreign affairs, and ex-officio president of the new tribunal, notified the powers that the court had been duly constituted. The heads of the delegations named by the fifteen countries were announced as follows: Austria-Hungary, Count Frederic Schonborn, president of the imperial royal court of justice; Belgium, M. Beernaert, former prime minister; Denmark, Professor L. Matzeen, president of the Copenhagen University and president of the *Landsthing*; France, M. Léon Bourgeois, ex-minister for foreign affairs; Germany, Herr Hingner, president of the imperial high court at Leipzig; Great Britain, Lord Pauncefoot, ambassador at Washington; Italy, Count Constantin Nigra, ambassador at Vienna; Japan, Mr. I. Montono, minister plenipotentiary at Brussels; Netherlands, Professor T. M. C. Assen, formerly professor of international law at the University of Amsterdam; Portugal, Count de Macedo, minister to Spain and ex-minister of marine and colonies; Roumania, M. Theodore Rosetti, ex-president of the high court of cassation; Russia, M. Pobiedonostzeff, procurator of the holy synod; Spain, Duke of Tetuan, ex-minister for foreign affairs; Sweden and Norway, Mr. S. R. D. K. d'Olivecrona, ex-associate justice of the supreme court of Sweden; the United States, ex-President Benjamin Harrison (died March 13, 1901). The other American members of the court named were Melville W. Fuller, chief justice of the Supreme Court; John W. Griggs, at that time United States attorney-general, and George Gray, ex-senator from Delaware and a judge of the United States Circuit Court. An Administrative Council, permanent at the Hague, comprises the Netherlands minister for foreign affairs as president, and the diplomatic representatives of all the signatory powers at that capital. The Council will have the functions of an international bureau, acting as a medium of communication between the powers, and employing the requisite minor officers necessary for carrying on the routine work of the tribunal.

The only appeal made to the court during 1901, that lodged by the representatives of the Boer republics in Europe, was disposed of by the Administrative Council without submission to the court. The Boers urged that the court take action on the ground that Great Britain had continuously violated the rules of civilized warfare. The Administration Council, replying on October 1, declared unanimously that it was without power to initiate an arbitration between the Boer republics and Great Britain. The international court, it was pointed out, is not a court higher than all governments, empowered to summon nations to its bar for judgment, but is a body having power to act only when both parties voluntarily and formally agree to submit their difference to it. Suggestions were made at two other times during the year for the submission of international questions to the court, but neither of them were acted upon. One was the proposal of Mr. W. W. Rockhill, special commissioner of the United States to China, that the question of the amount and the equitable division of the Chinese indemnity be submitted to the court. Although Japan apparently favored the proposition, the other nations would not agree to it, and nothing was done about it. Later in the year it seemed possible that the court might be called upon to give a decision in two minor disputes between France and England. Arrangements had already been made, however, by the two governments to submit the matter to Baron Lambermont, the Belgian minister for foreign affairs; and although there was some protest that this action was irregular, and that the powers, being signatories of the Hague conventions, should have laid their disputes before the permanent international court, no change was made.

Most of the sessions of the Pan-American conference (see MEXICO) in the city of Mexico, between its organization on October 26, 1901, and December 31, following, were consumed in discussing a plan of international arbitration similar to that adopted at the Hague conference, to be binding on the various countries of North, South and Central America. On June 17, 1901, the United States and Chilean Claims Commission, completed its work after having heard arguments on seventeen cases against Chile and two against the United States. The Commission allowed \$28,062 on a total of \$3,400,000 American claims. One of the Chilean claims for \$3,000 was allowed, and the others dismissed. Provision was made in 1901 for the submission of several other South American disputes to the arbitration of commissions or individuals. A commission began in August to examine into the demarkation of the boundary line between Brazil and Argentina; on November 6 a treaty was signed between Great Britain and Brazil, by which the King of Italy was made arbitrator in the boundary dispute between British Guiana and Brazil; a protocol was signed at Le Paz on November 26, submitting to arbitration the pending questions between the two republics of Bolivia and Peru, and the differences between Argentina and

Chile, which threatened to precipitate hostilities, were referred to the same British commission appointed in 1896 to settle other disputes.

In November a British-Italian commission, appointed to settle the boundary dispute between the Italian colony of Eritrea and the Soudan, began its sittings at Rome. Efforts were made by the Siamese government several times during the year to secure the consent of France to submit to arbitration some of the questions involved in the territorial dispute between Siam and French Indo-China (see SIAM). The proposal made by Siam, of the Czar of Russia as an arbitrator, was rejected by France; the Russian minister at Bangkok also opposed the plan, allowing it to be understood that the Czar would decline to act.

The seventh annual conference on international arbitration met at Lake Mohonk, New York, in the first week of June, 1901. After a discussion of many questions relating to war, and taking a very optimistic view of most of them, the conference decided to use every influence to get nations into the habit of using the newly established international court of arbitration. Much stress was laid on the point that, if the powers should get into the way of using it as a means of settling their minor disputes, they would be more likely to have recourse to it than to war when more serious differences should arise.

ARBITRATION, LABOR. The strike (See articles STRIKES and STEEL TRUST STRIKE) of most of the members of the Amalgamated Association of Iron, Steel and Tin Plate Workers who were employed by the United States Steel Corporation, and the breaking by the Amalgamated Association of contracts which it had signed with various of the constituent companies of the Steel Trust, raised anew in the United States the discussion as to the best means of averting such controversies between labor and capital, and especially as to the inherent but generally overlooked rights of the public in the premises. It was suggested in the first place that labor organizations ought to be duly incorporated concerns, with power to sue and be sued as such, thus giving them a corporate standing before the courts and permitting employers to obtain redress from the unions when contracts were broken without a just cause, instead of compelling the employers, as at present, either to suffer an absolute loss or fruitlessly sue the individual members of the labor organizations. In the second place, a considerable portion of the press considered that in strikes of such magnitude as that of the Amalgamated Association, where the public suffered heavily through the wholesale suspension of production, boards of arbitration should be appointed by State or federal authority, with power to examine and render a decision upon the facts and merits of the case. If the board was an able and impartial one, its decision when made public, even if the decision was not held binding upon either party, would have great weight in directing public sentiment and would thus tend to force concessions from one or both of the parties to the dispute. A portion of the more radical press, however, thought that the arbitrators' award should be made binding for a time specified by law, and that until the expiration of this time a resumption of work should be forbidden except upon full compliance with the board's findings. In objection to this plan it was pointed out that if the parties who alone knew intimately the condition and complications prevailing, and who penalized themselves heavily by continued misunderstanding, were still unable to arrive at a satisfactory agreement, there was but little chance that outsiders could do so. Moreover, employers could not be expected, merely upon an *ex cathedra* ruling, to continue to run their plants at a loss, or if they thought that under it they would be subjected to continual annoyance, nor would employees remain at work if they believed themselves underpaid, or overworked or unjustly treated. Speaking for organized labor in this connection, President Mitchell, of the Anthracite coal miners, said in Scranton in October, 1901, that compulsory arbitration of necessity implied a resort to some judicial tribunal; that the laboring men believed the judiciary to be prejudiced on the side of vested interests which they were constantly engaged in conserving and defending; and that under these circumstances the decision of a tribunal of arbitration would work to the prejudice of the workmen. On the other side, from the standpoint of unorganized labor, it was pointed out that compulsory arbitration would be equally disadvantageous; for if the law did not actually require it, yet the effect, in practice, would be that only labor unions, as such, would have a standing before the court. Unorganized labor, therefore, would be, as it were, outside the pale of the law, and consequently unorganized laborers would either be forced against their will to join a union or else to remain unprotected in their disputes with their employers. As instancing both this point and also the generally unsatisfactory working of compulsory arbitration, the effect of the arbitration laws in New Zealand was frequently adduced. But however the action of this court may appear to outsiders, it should be added that its workings seem fully endorsed by those most immediately concerned. A special commissioner appointed by the government of New South Wales

to examine the system reported very favorably upon it in 1901, as follows: "The act has prevented strikes of any magnitude, and has, on the whole, brought about a better relation between employers and employees than would exist if there were no act. It has enabled the increase of wages and the other conditions favorable to the workmen, which, in the circumstances, they are entitled to, to be settled without that friction and bitterness of feeling which otherwise might have existed; it has enabled employers, for a time at least, to know with certainty the conditions of production, and therefore to make contracts with the knowledge that they would be able to fulfill them; and indirectly it has tended to a more harmonious feeling among the people generally. . . . A very large majority of the employers of labor whom I interviewed are in favor of the principle of the act." The results of four years' operation of the New Zealand law appear in the following table:

YEAR.	SETTLED BY CONCILIATION BOARDS.	SENT TO COURT OF ARBITRATION,	TOTAL CASES.
1896-1897.....	3	4	7
1897-1898.....	4	16	20
1898-1899.....	8	17	25
1899-1900.....	14	20	34
	—	—	—
	29	57	86

But whether or not the New Zealand method of preventing labor disputes was to be finally adjudged as the best, it was generally recognized that arbitration in some form was becoming necessary to the United States, and various efforts were made during the year to solve the problem, at least in part, both by State governments and by private individuals or associations. Some interesting State laws passed in 1901 and bearing on this subject will be found in the article LABOR (paragraph Labor Legislation). The most notable unofficial movement looking toward the possible settlement of labor disputes will be found in the following paragraph dealing with the National Civic Federation.

Organization of the National Civic Federation.—A meeting of the National Civic Federation was held in New York on May 7 and 8, 1901, to consider the report of the national committee on conciliation and arbitration created at a convention held in Chicago in December, 1900. A large number of prominent representatives of labor and capital were present. The scope of the committee was defined as follows: "The committee will secure the fullest possible information as to methods and measures of arbitration in vogue throughout the world; it will put itself into communication with all representative bodies of men and employees, inform them as to its purpose, offer its services and secure their cooperation and good-will if possible, asking particularly of general organizations that whenever any specific questions are arising where there is no established method of joint consideration and settlement existing, the national committee be informed, in order that it may use its influence before trouble occurs. This method may be extended to local organizations when the committee may find itself sufficiently equipped to do so." A second meeting of the federation was called in December, in New York City, to consider the same subject. At this meeting the following board of arbitration was appointed:—*Capitalists:* Marcus A. Hanna, United States senator; James A. Chambers, president National Association of Store Manufacturers; S. R. Callaway, president American Locomotive Company; Lewis Nixon, president and owner of the Crescent Shipyard, Elizabethport, N. J.; Charles M. Schwab, president United States Steel Corporation; H. H. Vreeland, president Metropolitan Street Railway Company; Charles A. Moore, president of the Machine Manufacturing Company; John D. Rockefeller, Jr.; E. P. Ripley, president Atchison, Topeka, and Santa Fé Railway; Julius Kruttschnitt, general manager Southern Pacific Railway; Marcus M. Marks, president National Association of Clothing Manufacturers. *Labor Leaders:* Samuel Gompers, president American Federation of Labor; John Mitchell, president United Mine Workers' Association; Frank P. Sargent, grand master Brotherhood of Locomotive Firemen; Theodore J. Shaffer, president Amalgamated Association of Iron, Steel, and Tin Workers; James Duncan, secretary Granite Cutters' Union; Daniel J. Keefe, president International Association of Machinists; Martin Fox, president Iron Moulders' National Union; James M. Lynch, president International Typographical Union; Edward E. Clarke, grand master Brotherhood of Railway Conductors; Henry White, secretary Garment Workers of America; Walter MacArthur, editor *Coast Seamen's Journal*, San Francisco. *For the General Public:* Ex-President Grover Cleveland, Archbishop John Ireland, Bishop Henry C. Potter, Mr. Charles Francis Adams, Hon. Cornelius N. Bliss, President Charles W. Eliot, Mr. Franklin MacVeagh (Chicago), ex-Con-

troller James H. Eckels, Colonel John J. McCook (New York), Mr. John G. Milburn (Buffalo), Mr. Charles J. Bonaparte (Baltimore); Hon. Oscar S. Strauss, chairman of the conference; Mr. Ralph M. Easley, secretary ex-officio. A sub-committee of the general committee, consisting of 11 members, was also established, to be known as a labor court. Of this committee Senator Hanna was appointed chairman. The official statement of the plan and scope of this committee is as follows: "This committee shall be known as the industrial department of the National Civic Federation. The scope and province of this department shall be to do what may seem best to promote industrial peace, to be helpful in establishing rightful relations between employers and workers, by its good offices to endeavor to obviate and prevent strikes and lockouts, to aid in renewing industrial relations where a rupture has occurred. That at all times representatives of employers and workers, organized or unorganized, should confer for the adjustment of differences or disputes before an acute stage is reached, and thus avoid or minimize the number of strikes or lockouts. That mutual agreement as to conditions under which labor shall be performed should be encouraged, and that when agreements are made, the terms thereof should be faithfully adhered to, in both letter and spirit, by both parties. This department, either as a whole or as a sub-committee by it appointed, shall, when requested, act as a forum to adjust and decide upon questions at issue between workers and their employers, provided in its opinion the subject is one of sufficient importance. This department will not consider abstract industrial problems. This department assumes no power of arbitration unless such powers be conferred by both parties to a dispute. This department shall adopt a set of by-laws for its government."

Report of Industrial Commission on Arbitration.—The United States Industrial Commission, in October, 1901, published a summary of its forthcoming report on labor organizations, labor disputes, and arbitration. The report was prepared by Mr. Charles E. Edgerton and Mr. E. Dana Durand. The introduction to the summary presents a general view of the subject of arbitration. The two chief classes of industrial difference which may be settled by peaceful methods are: (1) those which concern the interpretation of the existing terms of employment; (2) those which are concerned with the terms of future employment and which are usually of greater importance. The most common method of settling such disputes does not involve a resort to arbitration or conciliation, and is known as collective bargaining, or peaceful negotiations between organized labor and the employers, usually carried on by "joint conferences" and confirmed by written agreements. When for any reason the method of collective bargaining cannot be relied on to settle the dispute, resort is naturally had to "conciliation," which is a term applied to the disinterested action of a third party in bringing together the two parties to the dispute for a friendly discussion and possible settlement of differences. When no agreement can be reached by this method, the next recourse is to the judgment of a third party, the arbitrator, who hears both sides and gives his decision, which the parties to the dispute may either reject or accept where the arbitration is voluntary, or which may be enforced by the courts where compulsory arbitration is the rule. A variation of this method is found in the decision of particular issues in dispute by boards composed of an equal number of representatives of employees and employers, who are not immediately concerned in the dispute and are therefore largely free from personal bias or animosity. This method is called "arbitration within the trade." In cases where an open breach has occurred, "mediation" is resorted to. This is the intervention of outside parties presumably acting in the public interest to bring about a conference and a resort to some means of peaceful settlement. "The most important results which have been accomplished by collective bargaining, conciliation, and arbitration have been in preventing cessation of employment. Differences which do not lead to open rupture are less conspicuous to the general public than prolonged strikes and lockouts, and the enormous importance of those settlements which are effected without any cessation of labor is often overlooked." The other topics treated in the report are as follows: I. Local collective bargaining; arbitration and conciliation, largely of an informal character. II. Formal systems of collective bargaining and agreements, between central organizations of employers and employees: (a) methods of adopting agreements by joint boards and committees; (b) terms of joint agreement as to time of duration, regulation of apprenticeship, rights of unionists, shop committees, and working cards, exclusive employment of unionists, and the union rate of wages. III. Local arbitration, conciliation, and mediation; (a) method of selecting arbitrators; (b) method of procedure in arbitration proceedings; (c) policy of disputants in regard to wages or employment pending decision and methods of carrying out decision. IV. Formal national systems of collective bargaining and arbitration; (a) extent of collective bargaining systems which are general in strong unions, by methods of organization and procedure in collective bargaining,

either by customing practice or agreement,—(1) methods of selection and number of representatives on each side, the method being usually representative and the number of workmen necessarily greater; (2) methods of discussion and agreement usually by joint session with reference of disputed points to separate sessions; (b) nature of agreements as conditions of labor,—(1) either uniform or less frequently varying with special conditions, (2) involving sliding scale or fixed wage, (3) nature of recognition of union (a) arbitration as to specific disputes, of a union and local character where provision is made for settlement within the terms of the general agreement. V. Collective bargaining and trade arbitration in Great Britain, where there were in 1899, 53 regularly established joint boards or conferences in operation, and where in 1899 disputes affecting 379,285 persons were settled. VI. Governmental arbitration in the United States; (a) State arbitration organized in 14 States; (b) local boards of arbitration and conciliation; (c) United States statutes, 1888 and 1898, the latter providing for reference of disputes on interstate transportation lines to the chairman of the Interstate Commerce Commission and the United States commissioner of labor, who may appoint a third arbitrator, their decision being binding; (d) working of State boards of arbitration, which is stated to be very imperfect, the boards in only a few States being active, largely because of a general ignorance of their existence. VII. Governmental arbitration in foreign countries, as yet of little consequence outside of Australia and New Zealand, where its operation is stated to be generally satisfactory.

ARBUTHNOT, FORSTER FITZGERALD, English Orientalist, died in London, May 25, 1901. He was born in England in 1833, and was for many years a member of the Council of the Royal Asiatic Society. It was at his suggestion and with the help he gave that the society's annual publication of Oriental translations was revived in 1888. Mr. Arbuthnot was editor of the series until shortly before his death, and had published under his own name a number of works, one on Arabic literature, and another on *The Credibility of our Accepted Chronology*.

ARCHÆOLOGY. I. Babylonia.—Though exploration and excavation have continued in Babylonia during 1901, as in previous years, the published results are practically confined to the German expedition under Dr. Koldewey at Babylon, whose frequent reports are published in the monthly *Mitteilungen der deutschen Orientgesellschaft*. The work has been carried on at three of the great mounds which cover the site of the ancient city, El Kasr, Tell Amrân and near the modern village of Jumjuma. El Kasr covers the palace of Nebuchadnezzar and the complete excavation will consume a long time, but gratifying results have already been obtained. Stone was scarce in Babylon and the alabaster reliefs which adorned the palaces of Nineveh were replaced by enameled bricks, such as were already known from the excavations of Dieulafoy at Susa. From the mass of fragments which had once lined the inner wall the figure of a superb lion has been completed, 1.95 m. long and 0.90 m. high. The background is dark blue, with yellow stripes and white rosettes, while the lion himself is white. Of the palace, a large court has been discovered, richly decorated with glazed bricks, showing flowers and tendrils, and others having the outlines marked by glass threads, while the body of the design is filled with colored enamel. More important still is the latest report, according to which Koldewey has found the actual throne-room of the king, a huge hall 18 m. broad and 52 m. long, with a niche at one end for the throne, and at the other the great entrance door. The decorations are said to be well preserved, and of the greatest importance for the history of art. From the outside of the palace ran the great street of processions in honor of Marduk (or Merodach), which was rebuilt by Nebuchadnezzar, as the inscriptions on many of the limestone paving-slabs declare. It was about 25 m. wide, and was over a quarter of a mile in length, though its entire course is not yet cleared. The building of this street, Aibur-shabu, from the gate of the palace to the temple of Ishtar (of which the site has also been determined), is mentioned in an inscription of Nebuchadnezzar, now in England. In the mound Amrân, it has been necessary to dig deep in order to reach important results, but the toil has been rewarded by reaching the famous Esagila, a Babylonian Pantheon, where around the temple of the great god of Babylon, Marduk, were grouped the shrines of many lesser deities. New material for a railroad, so necessary for the removal of rubbish from deeply buried ruins, has arrived and the work at this great sanctuary is to be pushed with vigor. At the third point, near Jumjuma, the most important discovery seems to have been a mass of inscribed clay tablets, containing letters, contracts, dictionaries and hymns, all of much importance for the language and religion of Babylonia, and for the better understanding of the Old Testament. Among the smaller objects found is a tablet containing a representation of the Babylonian Hades, with an inscription of some length, and a tablet with the hymns or prayers sung when Marduk returned from a solemn procession to his temple. In general, the excavations have yielded a comparatively small number of small

objects, but as the explorers penetrate into the interior of the palaces and temples the number of works of art and especially of documents is likely to increase.

The American excavations at Nippur, under the direction of Professor Hilprecht, of the University of Pennsylvania, have been temporarily suspended, in order to allow the study and arrangement of the mass of material already recovered, but they are to be resumed in a short time on an even more extensive scale.

II. Palestine and Syria.—The work of the Palestine Exploration Fund during the past season has been confined to such studies as can be pursued without special permission; for as yet the Turkish government has failed to issue the promised firman for excavations at an unnamed site, which is described as likely to yield much information on the pre-Israelitish and early Jewish periods and possibly on the puzzling Philistine problems. A museum has been established by the Turkish government in Jerusalem, where the lesser objects found by Dr. Bliss and other explorers are to be preserved. This is in accord with a new policy, which has in view the establishment of local museums at various points throughout the empire for the preservation of such antiquities as are not of sufficient importance to be brought to Constantinople. Konieh and Bagdad have also been designated as sites for such museums, and others will probably be added. The Imperial Museum has also taken part in excavations, having conducted during the summer an examination of Bostān esh-Shaykh near Sidon. The work was in charge of Makridi Bey, who had previously represented the government at the German excavations at Baalbek. The trenches brought to light the foundations of a Phœnician temple dedicated to Eshmun, and a mass of sculptures in stone, vases, terra-cotta, inscribed gems, etc. Most of the objects are of the Hellenistic period; but there are several Phœnician inscriptions, one of which gives the name, Bad-'Ashtoreth, of the hitherto unknown grandson of Eshmun'azar.

Two lesser discoveries are of some importance. The aqueduct near Jerusalem, which has been variously attributed to Solomon, Herod and Pilate, has been carefully examined and several Latin inscriptions found, which show that it is much later than had been supposed, as it was built in 195 A. D., during the reign of Septimius Severus for Ælia Capitolina, the Roman city, which occupied the site of Jerusalem. While traveling in the Hauran, Dr. George Adam Smith discovered at Tell esh-Shibâb, a basalt slab with an Egyptian inscription of Seti I., thus furnishing a new point in the extension of the Egyptian conquests towards the northeast before the Israelitish occupation of Palestine.

The past year also brought the publication of a preliminary report of an American expedition, which in 1899-1900 made a careful exploration of the region of central Syria, east of the Orontes and in the Hauran, visited by Count de Vogüé in 1861-62, and almost wholly neglected since that time. The expenses of the expedition were provided by four New York gentlemen, and the party consisted of Messrs. R. Garrett, W. K. Prentice, and H. C. Butler, of Princeton University, and Dr. Enno Littmann, of Oldenbourg, to whom were added later Mr. H. M. Huxley as anthropologist, and Dr. George E. Post, of Beirût. The mountain region of northern central Syria was entered from Antioch, and carefully explored, the numerous inaccuracies of the maps corrected, inscriptions copied, and a large number of photographs taken. The importance of the region lies in the large number of ancient towns, now deserted, but flourishing down to the end of the sixth century of our era, and abounding in well-preserved remains of churches, tombs and especially of the domestic architecture, which is nowhere so well represented unless at Pompeii. The houses, of two, three and even five stories in height, belong to all classes of society, and with the public buildings, furnish material for an important but hitherto obscure chapter in the history of the transition of architecture from the later classical to the Byzantine period. In the northern parts of this region the material is an easily worked limestone, while toward the south a hard basaltic rock is used, leading to a totally different architectural treatment, a fact still more plainly marked in the Hauran, where the basalt is also common, but not made clear in the work of previous explorers. Inscriptions in eight different languages were found, including 386 in Greek, less than half of which were previously known, and some of these only in inaccurate copies. The Syriac inscriptions are regarded as of great importance epigraphically, as such documents are very rare. The Nabatean inscriptions include one of the earliest known from the northern kingdom (5 B. C.), and Dr. Littmann was so fortunate as to find a number of examples of the rude Safaitic writing, including some new forms of letters and a number of complete sentences, which are especially valuable, as the previously known specimens had consisted almost wholly of proper names. An elaborate publication of the results is in preparation at Princeton. See *American Journal of Archaeology*, IV. (1900), pp. 415-440.

III. Egypt.—As in the past, Egypt continues to be the favorite field of excavators. Not only is the land full of unexplored and comparatively accessible sites, but the liberal policy of the government in permitting a considerable part of

the objects found to be removed to other countries, only reserving those of special importance for the Museum at Gizeh, naturally attracts expeditions largely dependent on private subscriptions. It is certainly true, though regrettable, that it is hard to secure funds for the mere increase of human knowledge, if no tangible returns can be secured by the contributors. Apart from these considerations, however, the long duration of Egyptian civilization, and its connection with that of the West, both in the remote past of the Stone and Bronze Ages and in the Græco-Roman and early Christian centuries, makes it an important subject of study for many others beside the specialists in Egyptology. This activity is shown by a list of eighteen permits issued to excavators by the Committee of Archæology, while the agents of the Museum worked at six other sites, and native Egyptians were allowed to carry on some small excavations. In general it has been the wise policy of M. Maspero to prevent so far as possible unauthorized digging, and to authorize only such expeditions as seem likely to be conducted in a scientific manner. In spite of these efforts the grave robbing by the peasants and Arabs is by no means suppressed, as stories of the dealers in antiquities show only too clearly. Of course objects placed on the market with no true statement as to their prominence and the exact circumstances of their discovery, are mere curiosities almost devoid of scientific value, but unfortunately none the less attractive to the tourist. The chief work of the Department of Antiquities is the preservation of the monuments already discovered, and the chief scene of its activity has been at Karnak, where it has had two special objects in view—the raising of the fallen columns and the inclosure of the ruins. In both of these good progress has been made. The foundations of the columns have been cleared and made secure, and one of the two villages, whose presence interferes with the inclosure, has been purchased and removed, while the other is to follow in 1902. This work of clearing and repairing has led to the discovery of some good statues. It is reported, however, that the damage done by floods will necessitate much labor in strengthening the monuments. Another important task has been the preparation of the General Catalogue of the Cairo Museum, which was begun in 1896 by an international commission, and of which two volumes have appeared, containing the *Ostraka* by Daressy, and the *Bronze Vessels* by von Bissing, while other volumes are in the press or completed in manuscript. The complete work will probably require twenty or thirty volumes. It is intended to include a complete account of the origin and history of each monument, so far as the records allow, the reproduction of the more important hieroglyphic inscriptions, and phototype reproductions of all objects of special interest.

The Egypt Exploration Fund and Egyptian Research Account have worked chiefly at Abydos and its neighborhood. At El'Amrah two prehistoric cemeteries and one of the Eighteenth Dynasty were carefully excavated; their importance seems to lie chiefly in the evidence they furnish of the passage from the prehistoric age to the tombs of the First Dynasty, between which a gap had previously been assumed. At Abydos, Petrie continued the excavation of the royal tombs of the First Dynasty, and as usual has promptly made his discoveries accessible by the publication of Part II. of *The Royal Tombs of the First Dynasty at Abydos*. Of the fourteen kings whose tombs have been discovered, four are assigned to the period before the First Dynasty, eight to that dynasty, and two, Perabsen and Kha-sekhemui, to the Second. In general it must be admitted that there is considerable difficulty in identifying the names with those assigned to the early dynasties by Manetho and the table of Abydos, but many indications derived from the arrangement of the tombs and the differences in style make the general principles of the succession probable. It should be noted, however, that Foucart proposes to identify Narmer, one of Petrie's predynastic kings, with the first king of the Second Dynasty; Petrie's chronology, which dates the earliest tombs in the neighborhood of 4800-4500 B.C., has also been called in question. While the discoveries of recent years have thrown a flood of light on the early civilization of Egypt, which can now be traced from the end of the Stone Age to the time of the Second Dynasty, and have made it very probable that no foreign conquest disturbed the native development, the chronological data are by no means certain, as there are still several gaps before we reach a fairly certain point in the establishment of the New Empire. In this connection may be mentioned another volume, *Diospolis Parva*, by Mr. Petrie, which contains a very carefully worked out system for dating prehistoric finds by a series of types of pottery, arranged according to evidence afforded by several thousand graves, opened at various points in Egypt. The sequences are numbered from 30 to 80, in order to leave room for additions, as it was then assumed that some 300 years separated 80 from the First Dynasty, though it is clear that no such gap existed, and some authorities are even inclined to place 75 in the reign of Menes. In spite of the reckless plundering of Abydos for centuries, many small objects of great interest have been found, including an extremely beautiful set of jewelry, in gold, turquoise, lapis-lazuli, and amethyst. Especially noteworthy is a bracelet of representations of the royal hawk in gold and turquoise alternately. To the north of Abydos, Mr. Garstang excavated

some early cemeteries for the Egyptian Research Account, but without striking results until a large structure at Bêt Khallâf was reached, where two large tombs were cleared. They proved to belong to Neter-Khet, already known as builder of a pyramid at Sakkara, and Hen-Nekht, previously unknown, but evidently a successor of the foregoing, both kings of the almost unknown Third Dynasty. Neter-Khet seems to have succeeded Perabsen, who closed the Second Dynasty. Near by were the tombs of high officials of these kings.

With the support of Mrs. Hearst, an expedition under the charge of Dr. Reisner has been conducting scientific excavations for the University of California at several sites, which have already yielded a large mass of small objects of all epochs, including many stone vessels and early cylinders, and a very remarkable collection of gold jewelry. The records of the expedition include a valuable series of photographs of almost every grave opened, furnishing important evidence on the subject of archaic methods of burial, among which it may be noted that dissection of the body, at one time regarded as common, is almost unknown. In every case but one the separation of the head from the body was accompanied by evidence of previous robbery of the grave. At Abusir the German excavators have continued the clearance of the interesting temple of the sun-god, Ra, built in the Fifth Dynasty, and of which the chief feature seems to have been a great obelisk, surrounded by courts and chapels. Near the inclosure was found a great boat, some ninety feet long, built of clay and wood, undoubtedly one of the "sun-vessels," in which the god voyaged through the lower world at night. At Abu-Roash, Chassinat has proved that the stone pyramid on the plateau in front of the village was built by King Didoufri, the successor of Cheops, of the Fourth Dynasty, and has found a number of fragments of sculpture, including a fine head of this little-known monarch.

For the Græco-Roman period the most important results are likely to come from the excavations at Alexandria, conducted by a German expedition under the direction of Professor Schreiber. A part of the work consists in an endeavor to recover the plan of the most important parts of the ancient city by sinking trial shafts and often driving tunnels to determine the direction of streets or walls. Of the results obtained no detailed account has been published, but they are said to be satisfactory. In connection with this work, the Messrs. Thiersch, father and son, are occupied with the study of the remains of the famous temple of Serapis, and are reported to have made good progress in the history of the building, though with much damage to previously accepted views. Not very far from "Pompey's Pillar," quarrymen accidentally discovered a necropolis of the second century of our era, built in four stories, of which, however, only the second and third have been cleared. From an artistic point of view the paintings and reliefs in this tomb and in a similar one in another part of the city are of the highest importance for the history of the later Alexandrian art. Grenfell and Hunt continued their persistent search for papyri, especially those of the Ptolemaic period, in the Fayûm, but with less success than usual; for though many cemeteries were examined, there was but limited use of papyrus in preparing the coffins and where it was used, the moist soil had in most cases caused its decay. Near the end of the season, however, they were rewarded by obtaining a large quantity of mummy cases in which Greek and demotic papyri had been employed. The number of publications of papyri, literary and non-literary, increases with every year, and scholars rejoice over the recovery of tantalizing fragments from lost works of classical literature, or over the letters, decrees, and government documents which give such a vivid picture of the village life under Greek and Roman rule. The past year has been no exception to this rule, but none of the publications are of great general interest.

IV. Asia Minor.—The report of the second campaign of the Berlin Museum at Miletus shows a rapid advance in the recovery of the ancient city, though as yet the discoveries of sculpture and other works of art are not very striking. Further excavations at the "theatre" showed that this building was the Senate-house (Bouleuterion). In front of the building was a court containing an altar, and bearing on its walls a number of important inscriptions, chiefly of Roman times. Here, too, was a round base with an inscription in honor of the general Lichas, which mentioned the building of the Senate-house at this point. The building seems to have been erected about 200 B.C. Excavations at the so-called "Lion Bay" brought to light the city end of the aqueduct from the southern mountains, and a series of halls and porticoes, which are compared with the Piazza at Venice. The exact nature of these buildings, whether Agora or Emporium, is not yet clear. The Hellenistic wall and a late fortification were also examined, and in the latter were found a mass of earlier material, including the torsos of archaic statues and many architectural fragments, which seem to point to an important temple of Artemis in the neighborhood. The ancient system of drainage and the plan of the streets was partially traced, leading to the discovery of many foundations of Hellenistic times, and a number of Roman mosaic floors, one of which contains pictures of the nine Muses, with their

names of the Hesiodic order. Excavations were also begun at a hitherto unknown Heroön, about half-way between Miletus and Didyma, but had not reached any satisfactory result when they were suspended for the season.

At Pergamon, the German Archæological Institute has continued the excavations, begun during the autumn of 1900. Thus far an important gate of the city of Eumenes has been fully cleared, and the main street, leading up the hill from this point, followed in its zig-zag course until a second Agora of the time of the kings was discovered, which is now to be thoroughly examined. A fine head in the type of Alexander the Great and a long inscription with regulations regarding streets, drains, fountains, etc., are among the most important of the lesser discoveries. It is already clear that in spite of all that has been done, the city of Pergamon is very far from being an exhausted site. In this connection may be noted the opening of the Pergamon Museum at Berlin, which has been built primarily for the proper exhibition of the reliefs of the great altar. This has been set up in the centre of the building in as nearly as possible its old position. The Ionic colonnade which crowned the structure has been replaced only on the western side, where the flight of steps led to the platform on which the altar proper rose. The interior of the court formed by the altar has been used to display the single statues and other works of art, including the colossal marble copy of the Athena Parthenos of Phidias, which was found in the ruins of the library.

During the summer of 1900 the brothers Körte carried on excavations near Pebi in Phrygia, where it was suspected the ancient Gordion had stood. The work was very difficult, and the results somewhat scanty, though of value as bringing to light the only known remains of early Phrygian buildings, not tombs. In the city the pottery seemed to indicate a continuous occupation of the site from c. 1500 B.C. to the Roman period, though of the tumuli opened only one was certainly older than the seventh century B.C. The pottery showed that from the sixth century B.C., Greek trade flourished, and many fragments of Corinthian and early Attic ware, as well as of the later classes of Greek pottery, were found. A series of terra-cotta reliefs, which had decorated the brick wall of an early temple, threw an interesting light on the rock-cut façades of the Phrygian tombs. No inscription proved that the site was Gordion; but the general character of the discoveries, when taken in connection with the literary evidence, confirms the theory that this is the site of the ancient Phrygian capital.

Important results are also reported from an exploring tour of Dr. Belck in Pontus and Cappadocia. His first centre was Amasia, an impregnable fortress of antiquity, where he found a new Greek inscription of Pharnaces, son of Mithridates, and his first work was the examination of the neighboring districts, including Comana Pontica and Cabira, the treasury of Mithridates. He then marched south and passed through the hill of Uyuk, where he found new Hittite monuments and decided that the entire hill is artificial, covering probably the ruins of a temple which he assigns to the period between 2000 and 1500 B.C. His next pause was at the celebrated Boghaz-Keni, where the rock sculptures were carefully studied, and part of a badly damaged Hittite inscription copied. Belck refuses to admit that the neighboring ruins are those of the ancient Pteria. He considers that the city is of Turanian origin, and was destroyed c. 700 B.C. Here were found many clay tablets with Assyrian cuneiform writing. Cæsarea in Cappadocia was then made the headquarters, and the Troglodyte region to the west visited. Belck is convinced that in Cappadocia a great Cimmerian kingdom existed from c. 700-585 B.C., which had destroyed the Hittite states, and itself fell before Cyaxares. The Moschi, who are declared to be ancestors of the modern Georgians, occupied the region between 750 and 680 B.C., when they were driven out by the Cimmerians. To them are due the mysterious "Cappadocian" cuneiform tablets, whose source Belck has discovered in a ruined temple not far from Cæsarea. The longest known Hittite inscription covers four sides of a stele, and the remainder of an inscription is engraved on the body of a statue, of which the beginning on the head of the statue is at Constantinople. The expedition was to continue its work as long as the weather permitted.

V. Crete.—As in 1900, so during the past year, this island has been the centre of interest for all classical archæologists, for the work already done has shown that only the beginnings have been made, and that here is concealed an unsuspected wealth of material calculated to throw new light on the difficult problems of early civilization in the Mediterranean. At Knossos Mr. Arthur J. Evans continued his excavations in behalf of the Cretan Exploration Fund. It was soon found that the first season's work had only uncovered a part of the western side of the palace, and that the building was far larger than had been supposed. The absence of a plan makes a detailed description impossible, but it may be said that the western area has been further excavated, bringing to light more magazines, some of them full of great earthenware jars. To the north another quarter of the building was found, in which was a large bath, reached by a descending flight of steps. The most im-

portant discovery was to the east of the great court, where another series of rooms, believed by the discoverers to be the state chambers, came to light shortly before the cessation of work. At one point the walls were found to descend much deeper than elsewhere, and soon a triple staircase was revealed leading to a series of apartments, one of which seems to have had a double series of colonnades. Staircases, one above the other, were previously unknown in ancient remains, and the discovery shows an unsuspected development of architectural skill among the Mycænæan builders. In such extensive excavations small finds are naturally numerous, and many of them are of great beauty and interest. Intercourse with Egypt receives further proof in the presence of the cartouche of Khyan, one of the Hyksos kings, while more extended trade is suggested by a Babylonian cylinder of lapis-lazuli mounted in gold. The amusements of the court of Minos are indicated by a "draught-board" of ivory, plated with gold, and set with crystal on silver and blue enamel, and a set of fishes of bone engraved with various symbols, apparently also belonging to some game. New fragments of wall-paintings were found, among others a series showing girls taking part in the dangerous but favorite Mycænæan sport of bull-hunting. Further fragments of painted stucco reliefs show portions of human figures modeled with close attention to details in the rendering of muscles and veins and yet with a power unattained in the early days of later Greek art. Beneath this palace were found remains of a large settlement of the later Stone Age, which yielded a number of stone axes and primitive "idols" of earlier types than those hitherto found on Greek sites. Mr. Evans believes that this settlement can scarcely be later than 3000 B.C. The fund has also contributed to excavations undertaken by Mr. D. G. Hogarth at Zakro, in the extreme east of the island, where a Mycænæan trading-post seems to have been found. There are no remains of fortifications or of a palace, but the basements of a number of houses were cleared, yielding many specimens of good pottery and bronzes, and a mass of impressions in clay of signets, containing over 150 types. It is said that exploration shows clearly that in eastern Crete the indigenous Eteocretans occupied the heights inland, while the "Mycænæans" settled at favorable harbors or on fertile spots near the coast where there was an opportunity for profitable trade. The director of the British School at Athens, Mr. R. C. Bosanquet, also excavated under the auspices of the Fund, at Præsos, the ancient capital of the Eteocretans, in the hope that this too might prove a Mycænæan centre. This proved an error, at least so far as the site of the city was concerned, though some scanty remains of the early period were found in the neighborhood. The results of the campaign were, however, by no means unimportant for the later period of Cretan civilization, when the place seems to have been an important centre. An inscription containing seventeen lines of an unknown language in Greek characters was found, and a large number of terra-cottas, which point to the existence of a local school of art. The chief prize was the head and shoulders of a youthful male statue, though a shrine near the town yielded terra-cotta statuettes of a goddess in a new type. At Petras, near the modern Sitia, were remains of a fortified Mycænæan settlement, a type new in Crete, but the site has been so damaged by the construction of terraces, that only small results were obtained. Next to the discoveries at Knossos, perhaps the most important results have been obtained by the Italians, Professor Halbherr and Mr. Pernier, at Phæstos, where another great palace has been partially excavated. The work has been in progress for two seasons, and much still remains to be done. On the surface were found Byzantine tombs, then Roman walls came to light, and then remains of a Greek city; below this were unimportant traces of an earlier Greek city and also remains of the period between the destruction of the palace and the Greek settlement. The Mycænæan palace occupies the lowest summit of the hill, and this position has given rise to a somewhat complicated plan, with many corridors and staircases. The stonework is careful, but as yet there is no evidence of the elaborate decorations which form so marked a feature at Knossos. Of interest is a court with, at one end, a broad set of steps, which lead nowhere and can only have served as seats. The great hall or Megaron is reached by a flight of twelve steps, about forty-five feet broad, and contained a transverse of three columns which supported the roof; side staircases afford easy communication with other parts of the palace, including a room which the discoverers with no little probability regard as the women's apartment. The smaller finds are somewhat scanty, and there seems little doubt that the place was thoroughly plundered.

America also has taken part in the work of exploration. Miss H. A. Boyd, who with Miss Patten excavated the post-Mycænæan (geometric) houses and tombs on the heights of Kavousi in 1900, returned with Miss B. E. Wheeler in 1901 under the auspices of the American Exploration Society of Philadelphia, to make further search for Mycænæan remains. Aided by some intelligent peasants of a neighboring village, she was so fortunate as to find on the low hill of Gournia "the most perfect example yet discovered of a small Mycænæan town." It is approached from the sea by a paved road, which divides at the foot of the hill, to unite again at the small

palace of the ruler. The interest of the site is largely in the well-preserved streets and private houses, often at least two stories high, of which twelve have been completely cleared. A special road leads to the only complete Mycæan sanctuary yet discovered, a small quadrangular building, in which were found vases and terra-cotta figures. The town was unfortified and seems to have been plundered and burned; but the ravagers were not very thorough in their search, for the houses contained many unbroken vases and a notable collection of bronze utensils and ornaments, including a saw nearly eighteen inches long.

VI. Greece.—The great discoveries in Crete and the important excavations in Asia Minor have drawn attention from Greece, although the progress of archæological discovery in that country has gone steadily on. The chief centres of excavation have been Ægina, Corinth, Delphi, and Tegea. On Ægina Professor Furtwängler has carefully explored the site of the so-called Temple of Athena, where Cockerell and his companions discovered in 1811 the pediment statues which, restored by Thorwaldsen, now adorn the Glyptothek in Munich. The expedition was sent by the Bavarian government in the hope that more careful search might yield more fragments throwing further light on the perplexing restorations and grouping of these sculptures. The results have been most gratifying. It is true that only two heads, which certainly belonged to the pediments, have been found, though it is possible that five others ought to be included, while the other fragments of these groups were not of very great importance. The scientific interest lies rather in the thorough clearing of the entire site of the temple, thereby bringing to view on the floor of the temple itself the marks which showed the position of the cult statue, and the holes for the posts of the railing which kept visitors at a proper distance, while in the sacred precinct were found the propylon and great altar, as well as other buildings of uncertain use, one of which contained an old Greek bath with three tubs. The smaller finds, terra-cottas, vases, etc., showed that the site had been occupied from the Mycæan period down to the fourth century, but in Hellenistic and Roman times it must have been almost deserted. The present temple was the fourth, and though the foundations of the earlier buildings were not found—the present structure is too solid to permit of search beneath it—architectural fragments were numerous, and many of them finely preserved and with brilliant coloring. The name of the temple was also fixed by the discovery of an archaic inscription in the Doric dialect, seemingly of the sixth century, recording the building of the house for *Aphaia*, the erection of the altar and the ivory (i.e. the wood and ivory cult-statue), and the construction of a wall about the sacred precinct. The age of the inscription and the place of its discovery alike render it certain that it does not refer to the present structure, but there can be little doubt that it is the official record of the earlier temple. Of this goddess we know but little. She was identified, according to Pausanias, with the Cretan Britomartis and Dictynna, and like them was later connected with Artemis. Early terra-cottas show her with a child in her arms, and it seems clear that she was one of the goddesses who brought help to women in all their needs, and guarded the growth of children. Many of the small objects recall those from the sanctuary of Aphrodite at Naucratis, a place where Æginetans were prominent, while others recall the oldest finds from the Artemision at Ephesus. Though the site of the temple has been finally cleared, further exploration of the island is planned, which it is hoped may lead to the discovery of the celebrated shrine of Damia and Auxesia, whose legend is told by Herodotus. An inscription, probably of the later fifth century, containing an inventory of the contents of this temple has been found, from which it appears that Herodotus was justified in his statement that the women of Ægina dedicated the long pins which secured their garments, to these goddesses, whose local names, however, were Mnia and Auzesia. Furtwängler states that all the discoveries confirm the date already assigned by him to the temple sculptures, and suggests that the building was erected as a thank-offering for the victory of Salamis, and that the ode of Pindar to Aphaia was written for its dedication.

At Corinth the American School at Athens continued the clearing of the ground to the west of the old fountain in the agora, finding remains of a series of vaulted rooms, which seems to have lined the south side of the hill on which the old temple stands, and probably had a colonnade along the front. Lesser excavations were made at Pirene, where a large basin was discovered beneath the later circular basin in the open air, and on the summit of Acro-Corinth, in an unsuccessful attempt to discover the famous temple of Aphrodite. West and south of the fountain Glaucæ attempts were made to find the Odeum and tomb of Medea's children; foundations of houses and a large platform of *opus incertum*, the latter covering early Greek walls, were found, but not the buildings sought. The year has, therefore, been a somewhat barren one in this field, but the temple hill may well be expected to yield good results when the Roman buildings have been cleared. The Greek government and the foreign archæologists regard the work as of great im-

portance, but the technical difficulties are great, and the work has been hampered by lack of sufficient funds to employ an adequate force.

At Delphi the French conducted what is probably the last campaign in their ten years' excavation. This season's work was devoted to clearing a site on the road from Arachova which was believed to have been occupied by the temple of Athena Pronoia. The result was the discovery of a narrow terrace over 100 metres long, surrounded by strong walls, with at least three gates, and containing six temples or chapels, two altars, and a dwelling for priests. At each end was a temple, one of porous stone, which seems to have been in ruins when Pausanias visited the place, the other of local limestone, seems to be the temple of Athena. There was also a small building, probably the Phocian treasury, built in the sixth century and decorated with sculptures in the best Ionic style, the whole much resembling the Treasury of Cnidus. The Tholos, or round building, a famous work, was far richer than those at Epidaurus and Olympia. In its Doric capitals it recalls the Parthenon, while the badly damaged fragments of sculpture recall those of the Mausoleum, and seem likely to play an important part in the history of early fourth century art. The sculptures found in these excavations are of especial importance as work of the fifth and fourth centuries has been but sparsely represented, most of the art of Delphi belonging to the archaic period. At Tegea the French have begun the excavation of the great temple of Athena Alea, and have already found more fragments of the pediment sculptures, including a head of Heracles, as well as beautiful architectural remains and a female head, which seems to be of the school of Scopas. Of the many surprises which have occurred in recent years in the field of classical archæology, few have awakened greater interest than the recovery from the sea of a cargo of statues and other works of art which were lost off Cape Malea near the island of Cythera, the modern Cerigo. It is known from Lucian that a ship of Sulla's, laden with works of art sent as spoil to Rome, was sunk off Cape Malea, and it is noteworthy that thus far no piece recovered can be assigned to a date later than the first century B.C. It should be added that some observers consider most of the works only copies made for sale. The first news came from sponge-divers, but the Greek government at once sent two ships with expert divers to the spot, and the end of the search is not yet reported. The statues and bronzes were naturally packed in the hold, and are said to form a mass over four metres deep, the bronzes of course on top. Unfortunately the marbles are for the most part so badly corroded by the action of the salt water, that only the merest outlines are recognizable. There is, however, one fine marble statue of a crouching boy, with the left arm raised and the right hanging at his side, which seems to belong to a realistic school of the Hellenistic times. Many of the bronzes are in a fair state of preservation, though often shattered. The gem of the collection is a fine statue of a youth, probably Hermes, somewhat more than life-size, which was found broken in many pieces, but with the beautiful head uninjured. It is said to stand to other bronzes as the Hermes of Praxiteles to marbles, and to be a worthy rival of the Olympian figure. It is said that the fragments can be pieced together, and that Herr Sturm, who successfully restored the bronzes from Ephesus, would undertake the task, provided he were allowed to take the fragments to Vienna, where were the necessary appliances. Among the smaller objects are numerous amphoræ and coarser earthenware vessels from the ship's stores, and also a number of glass bowls and vases, often of great delicacy and beauty in design and decoration, many of which the skill of the divers has succeeded in bringing to the surface uninjured. Many sites in Greece have been the scene of lesser excavations, which have yielded valuable information, but little of general interest.

VII. Italy.—As usual, the past year has seen many small excavations and chance discoveries in various parts of the peninsula, which have brought to notice many isolated facts of interest for Roman art and history. Prehistoric cemeteries have been searched and more information gained on those changes in burial customs which often afford a clue to the migrations of races in Italy. Sicily and Sardinia seem to have been the chief field for these explorations, and the choice of the latter is especially welcome, as opening up a region hitherto but little known. Already a cemetery of the neolithic and eneolithic times has been found with pottery such as characterizes this period in Sicily and on the mainland. At Nora remains of the Punic or Phœnician settlement have been discovered, together with later Roman walls and a necropolis of the second and third centuries of our era. At Pompeii the work of clearing the town goes steadily on, but no remarkably rich houses seem to have been reached during the year. Of interest is the publication of the remarkably beautiful and perfect statue found in November, 1900. It is bronze and attributed to the last years of the fifth century B.C., as the work of an artist who modified the Polycleitan type under Attic influence, but shortly before the destruction of the city was covered with a thin coating of silver and the right hand altered to fit it for use as a lamp-holder.

Rome still continues the centre of archæological interest, though the excavations about the Forum have furnished no startling sensations. The chief work has been done in connection with the removal of the church of S. Maria Liberatrice and the exploration of the venerable church of S. Maria Antiqua, which was thus brought to light. This church contained a number of interesting frescoes, some of which may be dated in the sixth century, and all of which are being carefully copied in full size, while the interior is to be protected by a permanent roof. Many graves have been found under the pavement of the church, and also a large piscina, which seems to have belonged to the imperial palace of the first century of our era, as it was partially destroyed by the building of the Augusteum. Boni believes that he has uncovered the foundations of the Arch of Tiberius in the Forum not far from the platform which he considers the rostra of Julius Cæsar, and Lanciani has proposed to identify with the ancient Volcanal, an altar of which remains can be traced on a rocky ledge at the foot of the steps of the Temple of Concord, and therefore close to the Comitium. Especial mention should be made in this connection of the valuable work of Otto Richter, *Die Topographie der Stadt Rom* (2d edition, Munich, 1901), which in an appendix gives an account of the excavations in the Forum since 1899, and is provided with valuable plans and illustrations. Of much interest to students of art is the purchase by the Italian government of the Ludovisi gallery of ancient sculpture, and the Borghese Villa, sculpture and paintings. The villa is to be preserved as a museum for the exhibition of the Borghese collections, and it is probable that the Ludovisi sculptures and the Corsini paintings will also be exhibited here, though without loss of their identity. The Ludovisi collection, though small, contains the famous seated Ares, probably the copy of a work of Scopas, the group of the Gaul and his wife, the colossal head of Hera, the group by Menelaus, and other works of importance in the history of ancient art. The municipality of Rome has also been presented by G. Barracco with his valuable collection of ancient marbles, but only on condition that it should not be placed in either of the museums of the Capitol. As a result a new building is to be erected on the Corso Vittorio Emanuele.

ARCHÆOLOGY, AMERICAN. During colonial days, studious pioneers were impressed by certain similarities between the customs of the American aborigines and those recorded in the earliest literature of the region about the eastern shores of the Mediterranean; and various suggestions were made as to former connection between the historical peoples of the East and the tribes of the New World—a conspicuous hypothesis being that connecting the American tribesmen with the "ten lost tribes of Israel." The various suggestions served to stimulate systematic study of the Amerind (or native American) tribes; some of the most extended records of observation on the customs of the native tribes (e. g., that of Lawson, 1708-1709) were inspired by the desire to prove connection between the Israelites, or other eastern peoples, and the western natives; and the influence of these studies extended widely and did much toward preparing the way for such systematic investigations as those of Gallatin, Morgan, Hale, Brinton, and other eminent American ethnologists. Throughout this early period, American archæology comprised little more than discussion of the origin and migrations of the red race discovered by Columbus; and the discussion was speculative rather than observational. As settlement extended beyond the Alleghanies and over the interior plains, attention was caught by the ancient mounds and other earthworks, especially in the valley of the Ohio and along the Mississippi bluffs and forelands; and the notion grew up that these great works were monuments to a people or race earlier than the aborigines found in the same region by the pioneers. The hypothesis proved peculiarly attractive, taking strong root in the minds of the settlers and spreading throughout the literature of this and other countries, the supposed ancient race being designated "Mound-builders." Like other firmly held ideas, this prevailing notion stimulated inquiry, and did much to attract attention toward prehistoric artifacts entombed in the mounds scattered over the surface and buried in separate graves. It was during this period that the scientific archæology of America began to assume definite form and purpose, and as speculation grew into actual investigation (after the normal fashion of increasing knowledge) important contributions to the young science were made by Squier and Davis in the Ohio valley, Lapham in Wisconsin, and other students. As the mound research progressed, the observers became more and more impressed with the similarities between the artifacts in even the most elaborate mounds and those employed by surviving tribes; and the idea steadily grew that, after all, the builders of the mounds were none other than the tribesmen whose lineal descendants still lived in the mound region. Naturally the comparisons of ancient and modern artifacts stimulated observation among the living aborigines, and hastened the development of a distinctively American ethnology, already assuming shape through investigations to which statesmen and other publicists were naturally led in their efforts to deal justly and peacefully with the aboriginal land-

owners. Thus the third stage in the development of American archæology was that in which the science became definitely observational, and in which it came to be recognized that the Amerind tribes and culture may best be regarded as essentially indigenous. True, suggestions of extraneous origin for people and culture have been raised and tested at every stage of progress; suggestions of affiliation with, or descent from, the Israelites of old, the Hittites, the early Egyptians, the ancient Phœnicians, as well as the Japanese and Chinese and Polynesians of the West, are indeed always with us; but the body of American archæologists have become satisfied to deal with the prehistoric relics of the western hemisphere as products of a single people ranging from the Eskimo of the North to the Fuegians of the South, or the direct ancestors of the same great people. Thus the field of American archæology is at once narrowed and rendered definite, and the investigators in this field have acquired the confidence of direct contact with phenomena, and have formulated classifications and principles which give promise of wide applicability as they are extended to other fields.

Definitions.—During the opening year of the new century the method of classifying artifacts in terms reducible to stages in intellectual development has been pursued with advantage. Thus, Holmes has reviewed his earlier studies of pottery, and especially of the symbolic designs impressed or painted on aboriginal fictile ware, and has made great progress in interpreting or identifying the symbolic designs, so that his monograph (still in the press) affords a means of classifying the tribes of eastern United States by intellectual status, and at the same time of correlating the stages of æsthetic progress with those of industrial, social, and fiducial development. Of similar import are the results reached by Fewkes in his studies of prehistoric fictile ware from the Pueblo region, and both lines of inquiry connect themselves instructively with the investigations of basketry conducted by Mason in the National Museum, and Dixon in the American Museum of Natural History. Of related import, too, are the results of Dorsey's work on collections of both prehistoric and recent material from several localities; while Culin, through a study of games and gaming implements among living tribes, has been able, in the first place, to interpret many puzzling artifacts from various prehistoric sites, and, in the second place, to outline the course of development of primitive thought along certain previously obscure lines. On the whole, the work of the year has tended to establish the classifications of peoples and their products according to a system of intellectual development. In this system the great stages are defined as (1) zoomimic, (2) protolithic, (3) technolithic, and (4) metallurgic; and while the basis for this arrangement is primarily industrial, it is found easily reducible to æsthetic, social, or fiducial bases; indeed, the chief strength of the classification in terms of intellectual development is found in the fact that it harmonizes the various line of activital growth.

Instrumentalities.—A number of powerful institutions have continued work in American archæology, either directly or indirectly. The Bureau of American Ethnology, under the Smithsonian Institution, maintained a party under Russell in archæologic reconnaissances, chiefly in Arizona, throughout the greater part of the year, and employed other parties in different districts for shorter periods; Dr. Fewkes made extended reconnaissances in portions of New Mexico and Chihuahua, (Mexico), not hitherto adequately examined; McGee conducted local investigations in Colorado; Swanton obtained material of archæologic interest in British Columbia; Stein studied the distribution of ancient and modern settlements in northern Greenland and Ellesmereland; and Mooney collected certain prehistoric material in connection with that of modern times in Oklahoma and Indian Territory. The National Museum, also under the Smithsonian Institution, continued the accumulation and study of prehistoric material from various districts; in addition, Hough made an extended survey and large collections in the Pueblo region, while Holmes, with Gill (of the Bureau of American Ethnology), made researches and collections of remarkable interest in Indian Territory. The work of the American Museum of Natural History (New York) was prosecuted with vigor and yielded important results, the researches of Saville in Mexico being especially noteworthy, and those of Pepper in the Pueblo region hardly less so. The Peabody Museum of Archæology and Ethnology (Cambridge) rendered excellent service to the science in both field and office, and the Museum of Archæology and Palæontology of the University of Pennsylvania (Philadelphia) made notable collections, largely through the personal efforts of Culin; while the rich material from other countries, added during the year, gave opportunity for comparative studies of great utility. The Carnegie Museum (Pittsburg) maintained steady growth, some of the additions made during the year by Hatcher being especially noteworthy. The Field Columbian Museum (Chicago) maintained energetic activity; the department of anthropology, under Dorsey, extending especially successful operations into the Pueblo region, the region of the plains, and other districts. The Golden Gate Park Museum (San Francisco)

continued the acquisition of instructive material both prehistoric and recent; while the University of California, aided by the munificence of Mrs. Phœbe A. Hearst, began archæological and ethnologic investigations of great promise. The work of the Museo Nacional de Mexico and that of the Archæological Museum of Ontario (Toronto, Canada) was continued, the researches of Leon in connection with the former and those of Boyle in the latter being noteworthy. Various individuals conducted important archæological investigations more or less independently of the institutions; Moore, of Philadelphia, Phillips, of Chicago, Thurston, of Nashville, and Moorehead, of New York, deserving especial notice. The voluntary associations serving to coordinate and guide archæologic inquiry include the Archæologic Institute of America (which is, however, devoted chiefly to Oriental and classic archeology), the Anthropological Society of Washington, the Ethnological Society of New York, and the Section of Anthropology of the American Association for the Advancement of Science; while a movement toward the formation of an anthropologic association of national character, which will doubtless foster archæologic work, was started just before the close of the year. The principal media for publication of material pertaining to archæology are, the *Annual Reports* of the Bureau of American Ethnology; the *Annual Reports* of the Smithsonian Institution and National Museum; the *Memoirs and Bulletins* of the American Museum of Natural History; the *Memoirs and Reports* of the Peabody Museum; together with the series of publications maintained by the Field Columbian Museum, the Museum of Archæology and Palæontology, and other institutions noted above. The independent periodicals comprise the *American Anthropologist*, New York, the *American Antiquarian*, Chicago, the *Proceedings* of the American Association for the Advancement of Science, Washington, and *Records of the Past*, Washington.

Notable Events.—By far the most striking event in American archæology during the year 1901 was the discovery of human relics associated with remains of extinct animals in a spring near Afton, Indian Territory. The discovery was made early in the year by Dr. R. H. Harper, of Afton, and was communicated to the Bureau of American Ethnology; and after correspondence concerning details, Professor W. H. Holmes, of the National Museum, and Mr. DeLancey Gill, of the Bureau, were commissioned to conduct an investigation on the ground. On visiting the locality in October, they made extensive excavations, revealing the geologic structure and the relations of both human relics and the animal remains to the spring in which they were originally discovered. The spring flows from a marshy depression lined with alluvium or muck of indefinite age, though of course largely modern. Beneath the alluvium lies a considerable deposit of stratified sand and gravel, throughout which are distributed bones and teeth of elephant, mammoth, sloth, native horse, etc.; the age of this deposit is indicated by the fossils to be late Neocene (Pliocene) or early Pleistocene, and while the observations were not sufficiently extended to permit physical correlation, the probabilities point toward the Columbia formation of early Pleistocene age. Naturally the first presumption was that of contemporaneity of the men who made the artifacts with the animals whose remains were entombed; and the presumption was strengthened by the finding of bones and teeth of buffalo, elk, deer, and modern (European) horse, associated with the implements in the spring. As the excavations were extended it was found, however, that the human relics and remains of recent animals were confined to the immediate vicinity of the spring and the alluvium, while the ancient remains were distributed throughout the undisturbed strata beneath the alluvium; accordingly it became evident that the case was one of juxtaposition rather than association, and that the juxtaposition afforded no evidence of contemporaneity of man and the extinct animals. In seeking to explain the occurrence of objects pertaining to two distinct geologic periods, the investigators profited by the experience of workers among living tribes, and were led to interpret the spring as a sacred place, or shrine, at which native devotees made sacrifice. In view of the habitual workings of the primitive mind, it was easy to see that the chalybeate and sulphur-bearing water of the spring, no less than the presence of the gigantic teeth and bones, would naturally inspire awe in the minds of aboriginal visitors, and prepare the way for shamanistic observances; while it would quite accord with primitive habits for the shamans and hunters to make the place one of sacrifice, and to cast into the spring portions of the buffalo and other animals taken in the chase, quarters or entire bodies of trained buffalo-horses sacrificed as invocations for future success, and the finest implements and trappings made for, or used in, the local industry of buffalo hunting; it would also be in accord with primitive philosophy for the mystery-loving tribesmen to bring giant teeth and bones found elsewhere for sacrifice at the same shrine. Thus, through acquaintance with the habits and ideas of primitive men, the investigators were able to explain satisfactorily a most striking and peculiar juxtaposition of modern relics and ancient remains, and so to solve what would otherwise be a puzzling problem in archæology; indeed, there have been many cases

in which related juxtapositions have remained to haunt the literature of the science for generations. It is, perhaps fortunate that after the field investigation was complete, and indeed after the results were announced before the Anthropological Society of Washington, correspondence brought out the fact that an aged Osage chief still living in another part of the territory retains some memory and distinct traditions of the identical spring as a place of sacrifice for success in hunting from time immemorial. The collections made at the spring were no less remarkable in number and character than in the peculiar juxtaposition; the collection of elephant teeth is the largest thus far made in a single locality in America. The mastodon teeth also form the largest collection thus far made at a single locality, and include two species; while the chipped implements of novaculite or related material are superb in size and finish, and form the finest known collection from a single American locality.

Another event of note (albeit only secondarily archæologic) was the definite establishment of a department of anthropology in the University of California at the instance, and through the munificence, of Mrs. Phœbe A. Hearst, Dr. A. L. Kroeber, with two or three collaborators, was placed in charge of the work; and there are several advisory collaborators, including Professor F. W. Putnam, of Harvard, Madame Zelia Nuttall, and Miss Alice C. Fletcher, of Washington. The work contemplated is both ethnologic and archæologic, the former directed especially toward the surviving California tribes and the latter toward the collection and interpretation of prehistoric material in the same region. Still another event grew out of a meeting of the American Association for the Advancement of Science in Denver, in August; after the close of the meeting a number of members of the anthropologic section made an excursion through the region of cliff dwellings in southern Colorado and northern New Mexico. The excursion was arranged by officers of the Cliff Dwellings Association, Mrs. Virginia C. McClurg, of Colorado Springs, Mrs. W. S. Peabody, of Denver, and Mrs. John Hays Hammond, being especially active. The participants in the excursion were much impressed with the desirability of taking steps toward the preservation of the interesting ruins of the region; and among the results of the excursion may be counted several bills introduced in the national Congress toward the close of the year by Honorable John E. Shafroth, Honorable John C. Bell, and others, designed to secure the protection of these antiquities from vandalism.

Noteworthy Publications.—An important memoir issued by the American Museum of Natural History early in the year was *Cairns of British Columbia and Washington*, by Harlan I. Smith and Gerard Fowke; the paper comprising a portion of the results of the Jesup expeditions to the northern shores of the Pacific. Other memoirs of the same series issued during 1901 are of archæologic interest, notably *Kwakiutl Texts*, by Franz Boas and George Hunt, and *Traditions of the Quinault Indians*, by Livingston Farrand, both of which open the door to aboriginal thought, and hence to the habits and customs of prehistoric times. The Peabody Museum issued an important memoir on the antiquities of the southern portion of North America, under the title *Researches in the Central Portion of the Usumatsintla Valley*, by Teobert Maler, and also a special publication touching on Mexican and other antiquities of the western hemisphere, entitled *Fundamental Principles of Old and New World Civilization*, by Zelia Nuttall. Early in the year the Bureau of American Ethnology published as a part of the eighteenth annual report, an elaborate memoir on *The Eskimo About Behring Strait*, by E. W. Nelson, containing incidental references to prehistoric material, while the motives expressed in the exceedingly numerous artifacts described mainly date back to the unwritten past. Later the nineteenth report appeared, with several archæologic memoirs; one of these, entitled *Mounds in Northern Honduras*, by Thomas Gann, describes in detail the antiquities of a little known region, including both tumuli and ruins of imposing structures; in *Mayan Calendar Systems*, by Cyrus Thomas, the calendric inscriptions of Yucatan are discussed at length and in part interpreted; while in *Primitive Numbers*, by W. J. McGee, and *Numerical Systems of Mexico and Central America*, by Dr. Thomas, as well as in *Tusayan Migration Traditions*, by J. Walter Fewkes, much use is made of prehistoric material as well as data derived from living aborigines. Publications of hardly less note have been made by the National Museum, the Field Columbian Museum, and other institutions in such number that the first year of the new century may justly be regarded as notable in the history of American archæology.

Studies of Artifacts.—While the current investigations have tended toward the formal establishment of the classification of stone artifacts as (1) zoomimic, (2) protolithic, and (3) technolithic, there has been little special work pertaining to the lines of human activity represented by the manufacture of stone. Holmes visited certain aboriginal quarry sites in southwestern Missouri, and also examined the site

from which Dr. Koch reported the association of stone implements with remains of extinct animals many years ago, and gained new data in both places. Phillips in Illinois, and Rust in California, continued investigating stone artifacts with success and good promise of early publication, while Moorehead collected material for revision of his work on *Prehistoric Implements*, 1899; and on the last day of the year, McGee presented before the Anthropologic Section of the American Association for the Advancement of Science, in Chicago, a communication on *The Beginning of Lithoculture*.

Human Antiquity.—The opening century has produced no new indications of high human antiquity on the western hemisphere. Putnam visited the Calaveras region during the autumn, and stimulated local observation in the auriferous gravels and other deposits, while Volk continued excavations in the late pleistocene gravels at Trenton; but neither locality has yielded noteworthy data during the year. So still, as during the last decade, the question of the antiquity of mankind in America remains open, with a presumption in favor of an origin running back toward, or possibly beyond, the beginning of the Pleistocene, but with scarce an indubitable fact indicating human existence on the western hemisphere before the latest ice invasion of the glacial period.

ARCHER, FREDERICK, musician, died at Pittsburg, Pa., October 22, 1901. He was born at Oxford, England, June 16, 1838, and studied music under his father, and also in London and Leipsic. Going to London he became an organist, and later was conductor of an orchestra and director of opera. In 1881 he removed to Brooklyn, N. Y., where he became organist of Plymouth church. In 1887 he conducted the Boston Oratorio Society; and from 1895 to 1898 was the conductor of the Pittsburg Orchestra, now under the direction of Victor Herbert. Among his compositions should be mentioned the *Adagio Maestoso*, *Fugue in D minor*, *Grand Fantasia in F*, for the organ, and the two texts, *The Organ*, and the *Collegiate Organ Tutor*. He was also the founder (1885) and editor of a musical weekly, *The Key Note*.

ARCHITECTURE. The chief architectural features of 1901 were undoubtedly the splendid buildings of the Pan-American Exposition (*q.v.*) at Buffalo. The influence of these structures upon architecture will doubtless be of real value, not only in the development of future expositions, but in the construction of industrial buildings both public and private. Architecture is also being fostered by many schools, clubs, and other organizations throughout the United States. The centennial of the Louisiana purchase has been taken as a fitting occasion for an international exposition at St. Louis (see LOUISIANA PURCHASE EXPOSITION). The unity, suitability, and magnificence of its architectural features are assured by the personnel of its board of architects, and the work of organization, designing, and draughting is in progress. A resolution introduced at the annual convention of the American Institute of Architects at Buffalo in 1901, after pointing out the importance of architectural improvements in towns and cities, and noting that municipal architecture had been the subject of a department exhibit at three international expositions abroad, appealed to the commissioners of the Louisiana Purchase Exposition for a similar exhibit at St. Louis. Among the buildings erected for the South Carolina Exposition (*q.v.*) at Charleston, the art building is the most artistic and impressive. It stands in a beautiful position, and has a large sculpture hall with two spacious and well-proportioned side galleries. Upon the suggestion of the art director, the thirteen exterior panels of the building were inscribed with the names of thirteen deceased American painters, sculptors, and architects instead of with the names of the old masters. The approved list was: Painters—Benjamin West, John S. Copley, Gilbert Stuart, Thomas Sully, George Inness, A. H. Wyant, Homer Martin, and George Fuller; sculptors—Crawford, Powers, and Story; architects—Richardson and Hunt.

Of national interest is the commission appointed to inquire into the enlargement of the White House, as is also the renewed proposal for a memorial bridge across the Potomac from Washington to Arlington. For continuing the examination of the bridge project, \$5,000 were appropriated in the sundry civil act of 1899. The first prize for design has been awarded to Mr. Edward Pearce Casey, with Mr. William H. Burr as chief engineer. Of greater national importance was the report of the Burnham Commission on the beautifying of Washington. The commission of three appointed to prepare the report visited Paris, London, Madrid, Rome, Vienna, Buda-Pesth, Munich, Berlin, The Hague, and Brussels, omitting St. Petersburg, because of lack of time. Berlin was considered artistically one of the first cities in the world. The report presented to Congress and the two models exhibited at the Corcoran Art Gallery in Washington in reality recommended the adoption of the celebrated plans prepared by L'Enfant under the supervision of Washington and Jefferson, with some modifications to adapt them to the altered and increased

needs of the capital of a nation of 70,000,000 people. The predominating ideas in the whole treatment are dignity and beauty. The plans call for systematic, continuous work carried through a considerable number of years, and reveal the contemplated construction of a number of handsome public buildings, and the laying out of gardens, parks, and avenues, all with an axial relation to the Capitol, White House, and Washington monument. The plans were prepared in pursuance of a senate resolution of March 8, 1901. The sub-committee of the district committee having the matter in charge met the representatives of the Institute of American Architects and agreed that Daniel H. Burnham, of Chicago, and Frederick Law Olmsted, jr., of Brookline, be employed as experts, with power to add to their number. These gentlemen accepted the task, and subsequently invited Charles F. McKim and Augustus St. Gaudens, of New York, to act with them in the preparation of plans. Charles Moore also rendered efficient service in cooperation with the commission. Congress is providing a reasonable scheme of taxation whereby the plans may be carried out without proving burdensome to the district.

Two new artistic structures in New York City are the Appellate Court House and the New York Yacht Club. An advance in domestic architecture is marked by the mansion at Roslyn, L. I., for Mrs. Clarence H. Mackay. The Tarsney act has exerted a beneficial influence upon government work, and carefully managed competitions now give results that exhibit a desire for better architecture. The Pennsylvania capitol competition resulted in the award falling to Mr. Huston. The treatment received by the profession, however, in this case, from the state commissioner, was the source of much adverse comment. The proposed buildings for Washington University, at St. Louis, Mo., are on a grand scale, and other noteworthy designs of 1901 are those of the Arkansas state capitol, the Indianapolis post office, the Newark court house, a court house at Fort Dodge, Ia., the Memorial Library for Washington and Jefferson College, Washington, Pa., and in New York the new Stock Exchange, the Union Club House, and the United States Customs House. The new cathedral of St. John the Divine, on Morningside Heights, New York, is slowly progressing; the monster lathe completed during 1901 for the dressing and polishing of the 32 huge monolithic columns of the choir, marks an epoch in the manufacture of machinery for architectural purposes. The demolition of the National Academy of Design building at the corner of Twenty-third Street and Fourth Avenue, N. Y., has occasioned some regret. This Venetian-Gothic building, with its conspicuous and variegated ornamentation of black and white, and its interesting history and associations, had during its quarter-century existence endeared it to American artists and citizens. The eight marble columns in the corridor of the old building have been removed for incorporation in the new and elaborate building to be erected at Amsterdam Avenue and One Hundred and Ninth Street, where the National Academy of Design has temporary quarters. The designs of the new building are by Carrère and Hastings, architects also of the New York Public Library, now in course of construction at Fifth Avenue and Forty-first and Forty-second streets. The sixteenth annual exhibition of the Architectural League of New York was held in February and March, 1901, and maintained the high standards of previous exhibitions.

Both in the United States and in Great Britain agitation continued in 1901 for the registration of architects. The need was emphasized in England by several actions for heavy damages, which brought home the liability of architects for inefficiency or negligence, and were useful as aiding to weed out the charlatans who impose themselves upon the public. An attempt was made to awaken the Royal Institute of Great Britain to a sense of its responsibilities by a resolution "to appoint a committee to inquire into the status of the architectural profession and to suggest remedies if needed." The resolution received particular prominence, following as it did on the action of the government authorities in the selection of successors to the deceased architects for the new offices in course of construction in Whitehall and Parliament Street, although in the selection of the son of one of the late architects, the British characteristic of hereditary transference was apparent.

Among the principal events in the architectural sphere of the United Kingdom of Great Britain and Ireland was the choice of an architect—restricted to five nominees—to elaborate the architectural appointments of the National Memorial to the late Queen Victoria (described under SCULPTURE), the work of Mr. Thomas Brock, R.A., the sculptor who was chosen by a sub-committee of the committee appointed by the King. The restriction and choice occasioned considerable caustic criticism on the score of favoritism. In ecclesiastical architecture the new cathedral for Liverpool, in connection with which one of Mr. Gladstone's last expressed wishes was that he would were he possessed of \$5,000,000 wherewith to endow the city with the cathedral, was also the occasion of serious controversy. St. James' Mount, the central site chosen, was generally approved; but when the committee in charge stated their preference for a particular phase of English Gothic, a controversy arose as to

whether Renaissance was not the more appropriate garb for a twentieth-century English cathedral. The committee eventually expressed a desire to consider other designs. The chairman, in replying at considerable length to critics of the cathedral scheme, gives assurance that if any genius can produce a great and magnificent twentieth-century cathedral, the committee will not select an adaptation of a thirteenth or fourteenth-century Gothic edifice.

The danger to St. Paul's cathedral by the tunneling for the underground railways occasioned considerable alarm, which has not been allayed by the optimistic reports and suggestions of the cathedral architect. The completed restoration of Lichfield cathedral, including the statuary and ornamental work destroyed by the Puritans, has renewed in this ancient edifice its essential characteristic of beauty. The restoration of the west front of Bath Abbey has also been completed. Auxiliary scaffolding in the restoration, now in progress, of Peterborough cathedral made possible a critical examination of the colossal statue of St. Peter, which, undisturbed, has overlooked the city for eight centuries. With the exception of the missing right hand it was in an excellent state of preservation. One of the most interesting items in the progressing restoration of Canterbury cathedral was the repolishing of two pink marble pillars which came from the ruins of ancient Carthage and were sent in 1176 by Pope Alexander III. to form part of Thomas à Becket's tomb, but were incorporated in Trinity chapel, where they now stand. The restoration of the Lady chapel of Winchester cathedral is interesting to Americans, as the funds for the purpose were obtained by the sale of a picture of Benjamin West's, which was removed from the great screen in 1900. The picture was sold to Mr. J. Pierpont Morgan for £1,500 and is now in New York. The external fabric of the Roman Catholic cathedral in Ashley Gardens, Westminster, is rapidly approaching completion, and the originality and beauty of the design can now be thoroughly appreciated. Designs for St. Anne's Roman Catholic cathedral at Leeds were accepted in 1901.

The architectural features of the Glasgow International Exhibition (*q. v.*) were of a utilitarian order, marked by an absence of original designs. Competitions throughout the United Kingdom ended in the selection of plans for a new borough asylum at Cardiff, municipal buildings at Hereford, a Blue Coat Hospital at Hereford, work-house infirmary for Stockport, police courts and fire station at Manchester, and police courts at Bristol. Numerous large buildings in course of construction include the Victoria and Albert museum at South Kensington, new municipal buildings at Cardiff, and a market hall at Leeds, while the building of apartment houses in London on American models is an evidence of the architectural trend of the period. Without competition the authorities of the University of Birmingham gave the commission for their new buildings to the architects who, in open competition, won the commission for the splendid law courts in that city. The Building Trades Exhibition at the Agricultural Hall, London, was conspicuously successful. The principal death recorded among the architects of the United States during 1901 was that of Napoleon Le Brun, New York, at the age of eighty. The obituary of the profession in Great Britain included such well-known names as Arthur Cates, James Brooks, John McKean Brydon (*q. v.*), John Burnet, Henry Yeoville Thomason, Charles John Innocent, William Bassett Smith, Frederick Boreham, and Charles Dorman.

In France, the famous *Ecole des Beaux Arts* at Paris, celebrated its two hundred and fiftieth anniversary in 1901. At the *Institut de France* the subject for competition for the *Grand Prix de Rome* in architecture was of especial interest to Americans—"An American Academy of Arts and Sciences at Paris to be constructed on a portion of the sites of the demolished fortifications." The *Grand Prix* was awarded to M. Hulot, a pupil of M. Marcel Lambert. Of the two permanent buildings that remain of the 1900 Exposition—the *Grand Palais* and *La Petit Palais des Beaux Arts*, the palm is awarded the latter; and in French architecture of the year the striking features in Paris are the Quai d'Orsay railway station, the beautiful *Musée Galliera*, the *mairie* of the tenth *arrondissement*, many handsome private residences, and, at Tours, the new city hall. Open competitive designs were received for a museum at Clermont-Ferrand, a church at Grenoble, a circus-theatre at Troyes, covered markets at Auxerre, and public schools at Havre. The subject for the tenth annual government competition was a public hospital. The first prize was awarded to M. Clabant.

In Germany, some of the architectural productions of 1901, while bearing a national imprint, by the peculiarity of their designs gave rise to the query, "Is German architecture decadent?" The completion of the *Befreiungshalle* at Kelheim, Bavaria, endowed that city with a splendid and classic structure.

Austro-Hungarian architecture was marked by the completion of the magnificent Houses of Parliament at Buda-Pesth, commenced in 1885.

In Greece, the first prize for designs for a palace of justice at Athens was awarded to M. Alexandre Nicoloudis, a Greek architect at Paris. In Italy, archi-

ture was not at a standstill, as evidenced by the progress or completion of the splendid National Art Gallery at Rome, in Renaissance, or Bramantesque, the Salimbeni palace at Siena, a synagogue at Florence, a new bridge at Pisa, a theatre at Palermo, the peculiar Mole Antonietta in memory of Victor Emmanuel at Turin, the arch and gallery also dedicated to the late king at Milan, and numerous fine commercial and residential edifices throughout the country.

ARCTIC EXPLORATION. Two expeditions were in the field in 1901 for the purpose of testing two rival routes to the North Pole. A third expedition for the purpose of testing a third route was proposed, but the commander could not fit out his ship in time to start. Of the many "royal roads to the pole", among which Arctic authority has vacillated during the last quarter of a century, all have been abandoned except these three. The first two—the Smith Sound route and the Franz Josef Land route—involve the establishment of headquarters on solid ground as far north as possible, and a dash with sledges and dogs northward across the frozen sea. The third route—Nansen's route—involves a drift in a ship, frozen into the ice-pack, across the Arctic Ocean from some point north of Siberia. Captain Bernier, a Canadian, announced in 1900 that he would undertake this last route; but he could not make his preparations in time to set off in 1901. The other two expeditions are in command of Americans. All these expeditions are avowedly seeking the Pole. The collection of scientific data is a secondary object in the published plans of each leader.

Robert E. Peary and the Smith Sound Route.—The news that Mr. Robert E. Peary, C.E., U. S. N., had discovered the northern extremity of Greenland reached the United States in September, 1901. The sledge trip by which Mr. Peary accomplished this exploration was made in the spring of 1900. The leader, accompanied by Dr. T. S. Diedrick and by his colored servant, Matthew Henson, began his expedition in 1898. Funds for the maintenance of his work are supplied by the Peary Arctic Club, an organization of influential men who are interested in Mr. Peary's enterprise. The leader established preliminary headquarters at Etah, on the west coast of Greenland; and, during his first season, transported supplies across Smith Sound and northward to Fort Conger, but in doing so froze seven toes, which had to be amputated. Nevertheless, news reached this country, in the fall of 1900, that in March of that year Mr. Peary was at Fort Conger, intending to start early in April upon his sledge trip to the Pole. Meanwhile, in July, 1900, the *Windward*, a ship owned by the Peary Arctic Club, bearing supplies for Mr. Peary, and, as passengers, his wife and daughter, had started to communicate with the explorer. The *Windward* did not return in the fall, and many authorities in Arctic matters believed that she had been lost in the ice. On July 15, 1901, the *Erik*, a steamship chartered by the Peary Arctic Club, in command of Mr. Herbert L. Bridgman, secretary of the club, sailed from Sydney to ascertain the condition of both the explorer and the *Windward*. On September 13, the *Erik* returned to North Sydney, Cape Breton, bringing Mrs. Peary and her daughter as well as the news of Mr. Peary's success in 1900, his abortive expedition in 1901, and his intention to make another effort to reach the Pole in the spring of 1902. The *Windward* had passed the winter of 1900-01 in Payer Harbor, near Cape Sabine. There the *Erik* found her August 4, and the two ships spent the available time before it was necessary to return to this country (August 29) in hunting walrus for dog food, and in transferring supplies from Etah to Mr. Peary's new headquarters at Herschel Bay, ten miles south of Cape Sabine. Meanwhile Dr. Diedrick resigned from the expedition. His resignation was accepted by Mr. Peary and he was ordered home; but he went ashore, ostensibly to hunt rabbits at Etah, and sent an announcement by Eskimos that he intended to stay there over the winter in order that, in case of need, the explorers might have a physician within reach. Remonstrance proved unavailing, and rather than use force, the leader permitted him to remain. Members of the auxiliary party supplied him with a gun and some ammunition. His intention was to live among the Eskimos, in Eskimo fashion, eating seal and walrus, and sleeping in Eskimo igloos, and to make studies of this aboriginal tribe, which is isolated from the rest of the world and thus retains its primitive characteristics. Dr. Diedrick's resolution to remain excited a good deal of discussion in the newspapers, and theories were advanced that he intended to undertake on his own account a trip to the Pole; but members of the auxiliary expedition deemed this hardly credible. A seaman and cook, named Charles Percy, volunteered to join Mr. Peary in his future work and was accepted. The *Erik* brought back also journals and other relics abandoned at Fort Conger by the Lady Franklin Bay Expedition under Lieutenant (now General) A. W. Greely, when it left its headquarters in 1883.

Mr. Peary's Sledge Journey.—Mr. Peary left Fort Conger, lat. 81° 44' N., on April 15, 1900, with Henson and five Eskimos. He crossed Robeson Channel and

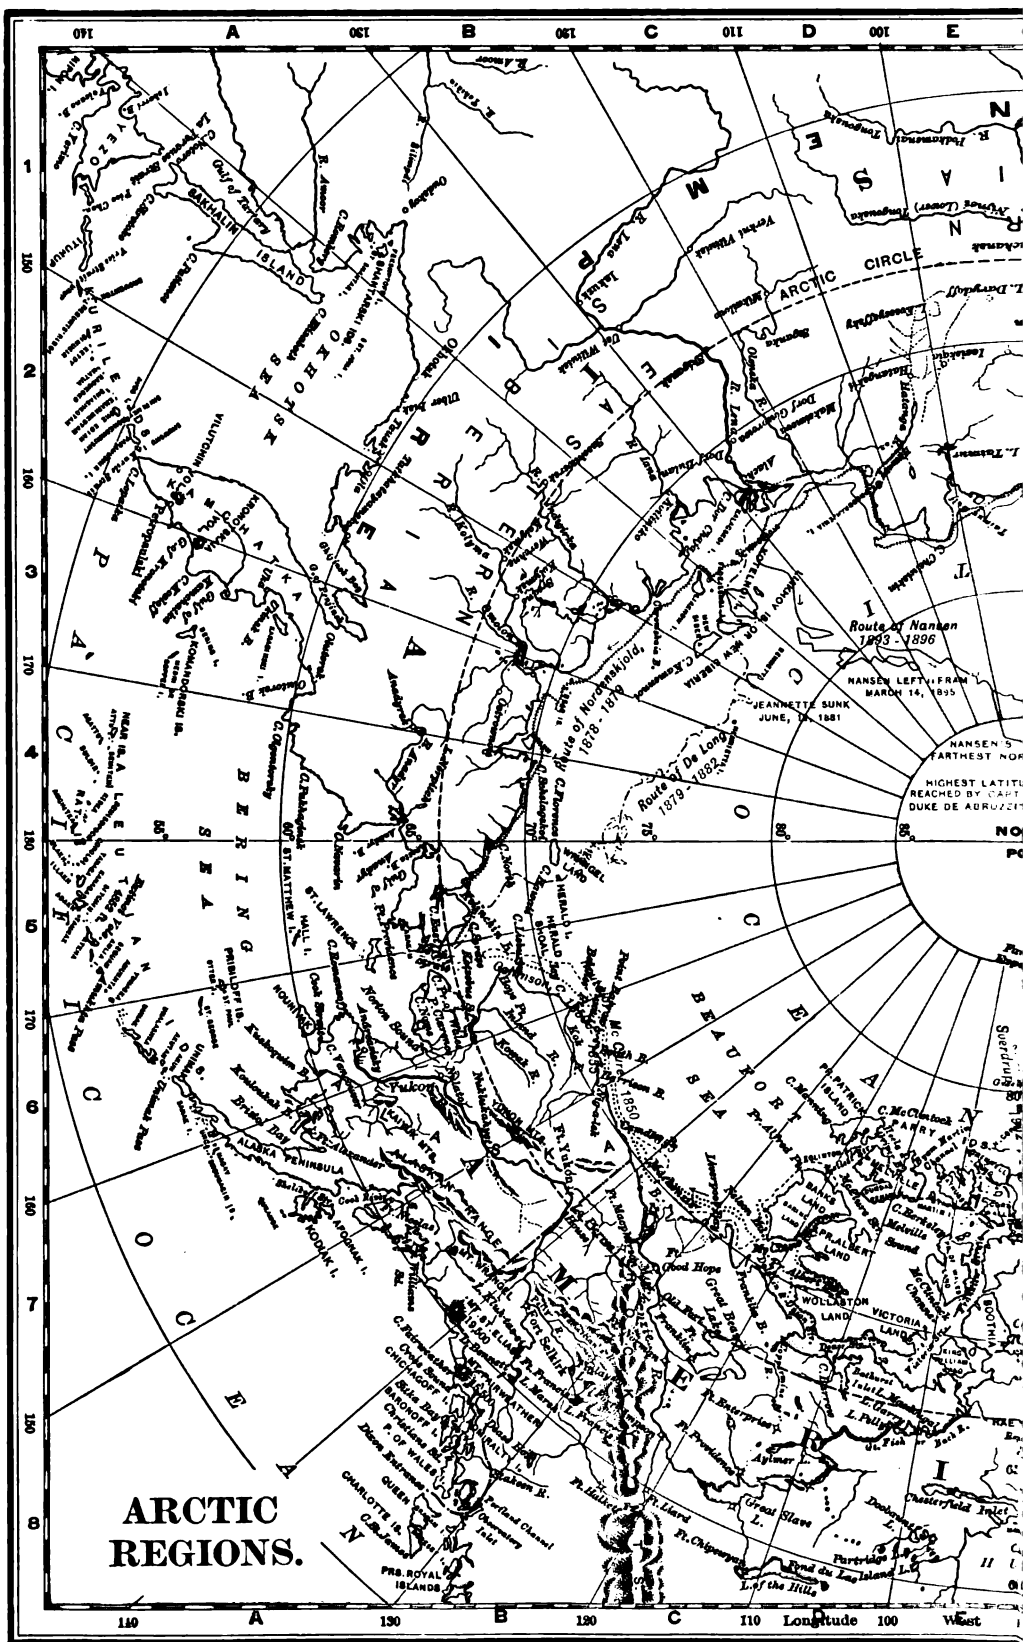

proceeded northward along the West Greenland coast. He sent back two natives from Blackhorn Cliffs on April 26, and early in May two more from Cape Britannia. On May 8 he opened the cairn built May 13, 1882, by Lockwood and Brainerd, of the Lady Franklin Bay Expedition, at $83^{\circ} 24'$, the record of the "farthest north" on land which had held for eighteen years. From this cairn he took a thermometer, a spy glass, and some records, which were afterwards brought back by the *Erik*. He then pushed on with Henson and the Eskimo, Ahngmalukto, to $83^{\circ} 39' N.$, where the coast began to trend southward. He deposited a cairn with records and then struck out due north over the sea ice. He reached $83^{\circ} 50' N.$; the ice beyond him was not difficult and he was in condition to proceed further, and possibly to surpass all records; but he perceived that the journey to the Pole itself was not feasible, and, therefore, instead of attempting to make a record, he proceeded southeastward, for the purpose of defining the northern boundary of the archipelago which lies above Greenland. About 160 miles beyond Lockwood and Brainerd's cairn, in lat. $83^{\circ} N.$ long. $25^{\circ} W.$, he came within sight of a mountain to the southward seen by him looking north from Independence Bay on the east coast of Greenland, July 4, 1892. He turned about May 22, and on June 10 reached Fort Conger. During the winter he explored a part of Grinnell Land, and shot a few musk-oxen. On the fifth of April, 1901, with Henson and five natives he started again; but this time approached the sea-ice from the north of Grinnell Land. But the winter had been hard and neither men nor dogs were in condition for their best work, and after ten days the explorers turned back toward Cape Sabine, where on May 6 they found the *Windward* awaiting them. Before the *Erik* arrived, August 4, Mr. Peary had replenished his supplies at Fort Conger and had laid a line of caches from Cape Sabine to this base of operations. His plan was to attack the frozen sea at Cape Hecla, in the north of Grinnell Land, in April, 1902. During the summer of that year a ship will be sent by the Peary Arctic Club to ascertain the outcome of this sledge journey.

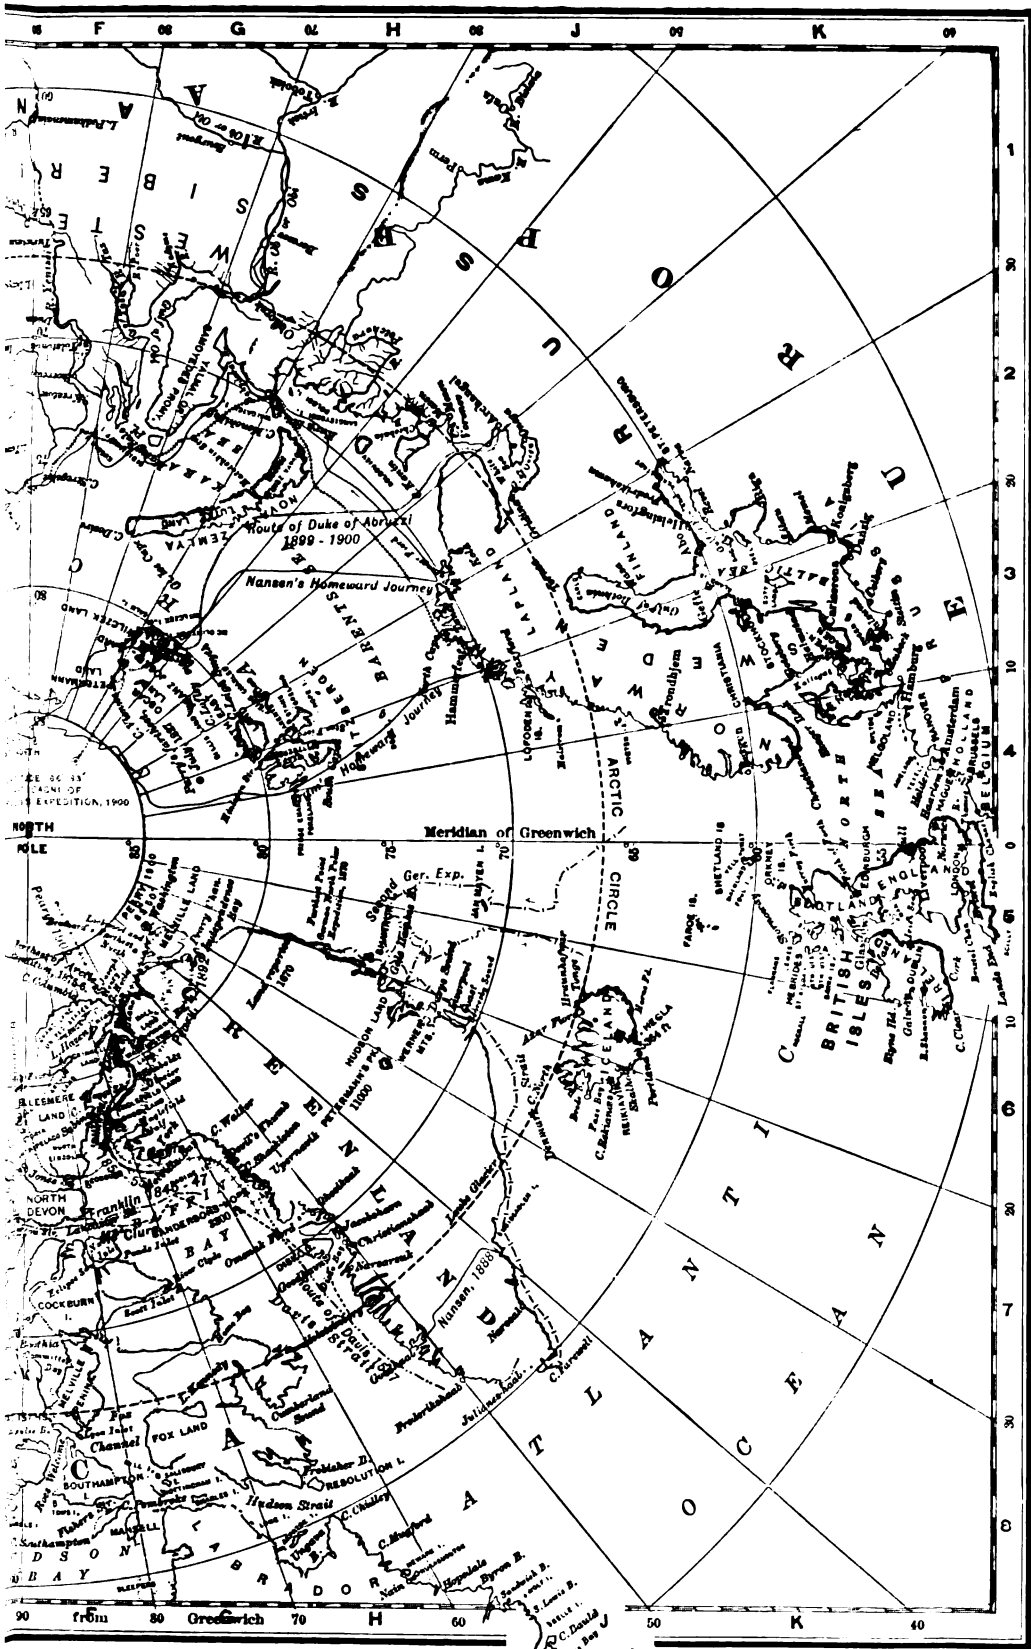

Results of Mr. Peary's Expedition.—No report has been published of what Mr. Peary may have accomplished in the line of purely scientific research. That he will have valuable ethnological information is unquestioned by Arctic authorities. He is a conscientious surveyor, and has undoubtedly corrected errors known to exist in the maps of the regions which he has visited for the first time. In previous years he has made extensive observations of glacial phenomena and has probably continued them during this present expedition. The accounts of his explorations are valuable mainly as a basis for future expeditions. He has demonstrated that in all probability the Greenland archipelago ends south of the 84th parallel. The Smith Sound route, then, is not as explorers had hoped, a land route to the Pole. Future explorers must commit themselves to the uncertainties of the shifting ice pack. Mr. Peary has determined to venture out upon this ice pack at a point some sixty miles south of the most northern land. If he does not succeed in reaching the Pole, then the Smith Sound route will be thrown open to other explorers.

The Stein Expedition.—The *Windward*, which followed the *Erik* home, brought back Mr. Robert Stein and Dr. Samuel Warmbath of the Stein expedition to Ellesmere Land. This expedition of three men obtained transportation in 1899 on the auxiliary steamer which communicated with Mr. Peary. The expedition was landed on Ellesmere Land. It was very inadequately equipped and accomplished nothing of note in the way of exploration. Dr. Leopold Kahn, the third member of the party, returned home from Cape York by a Dundee whaler in 1900. Mr. Peary eked out with provisions the scanty supplies of the remaining members of the party and gave them passage home.

Captain Sverdrup and the Fram.—No news has been received of this Norwegian expedition, which started in 1898, by the Smith Sound route, to explore the northern regions of Greenland, and perhaps to circumnavigate the island. In 1899 the *Fram* and Mr. Peary's ship, the *Windward*, sighted each other in Kane Basin. The Norwegians had made some explorations in Ellesmere Land, but had been checked by the ice from proceeding beyond Kane Basin. The *Fram* was last seen in August, 1899. Mr. Peary deems it impossible that she could have passed Fort Conger without his seeing her, and the supposition is that she may have abandoned the plan of investigating upper Greenland and have turned her attention to Jones's Sound. Jones's Sound is much incumbered with ice, and it is feared that the *Fram* may be beset. She has supplies for five years, of which three have now elapsed. It is rumored that plans for a relief expedition are being formulated in Norway.

The Baldwin-Ziegler Expedition and the Franz Josef Land Route.—Mr. Evelyn B. Baldwin (*q.v.*) has chosen as his base of operations Franz Josef Land, from which Captain Cagni, of the Abruzzi expedition, in 1900, started on the sledge journey which reached $86^{\circ} 33'$, the "farthest north." In general, Mr. Baldwin's plans comprise: (1) the establishment of a base of supplies on the northernmost point of the Franz Josef Land Archipelago, and, if possible, the establishment of a line of sup-

plies out upon the ice north of all land; (2) a sledge journey across the ice pack to the Pole; and (3) a return southwestward in the course of the Greenland current to either Koldeway Island or Shannon Island on the East Greenland coast. For the accomplishment of these plans, Mr. Baldwin is provided with multifarious devices. For his expedition, funds practically unlimited were furnished by Mr. William Ziegler, of Brooklyn, and no Arctic expedition, not even the famous Nares expedition, has been so elaborately equipped as this. The leader has three ships: (1) the Dundee whaler, *Esquimaux*, renamed the *America*, a barque-rigged steamship of 466 tons, which was completely refitted at Dundee for special service as the flagship of the expedition, with new decks, new masts, and accommodations for making the crew unusually comfortable; (2) her tender, the *Frithjof*, a steamer of 260 tons; and (3) the *Belgica*, a barque which transported the expedition under Lieutenant de Gerlache, that first passed a winter below the Antarctic circle (1898-99). Mr. Baldwin has four houses in parts ready to put together; and these, being constructed with a double shell, can be turned into eight if necessary, at the will of the leader. He has in addition to a comfortable supply of ordinary canned foods, and the standard food for sledge journeys, pemmican, a large number of new condensed foods; 8,000 pounds of coffee in tablets; 1,500 tins of crystallized eggs, etc. In all, he has 200 tons of concentrated food.

Forty Balloons.—In order to mark the advance of his party, and in general to give out records of his work, Mr. Baldwin is supplied with forty balloons, each holding 3,000 cubic feet of hydrogen gas produced by the vitriolic process. To each of these balloons ten top-shaped cork buoys, copper sheathed and weighted with lead, each buoy weighing ten pounds, are attached by a rope. When the escape of gas causes a balloon to fall so low that the lowest buoy strikes the ice, a device releases the buoy, and relieved of its weight, the balloon springs up once more, and so on until all the buoys are set free. In each buoy there is a hollow brass tube which contains records showing the accomplishments of the party to the time when the balloon was sent up. The buoys are painted red and blue, and each is provided with a metal American flag. It is expected that they will float with currents until they are picked up, and thus they will furnish records of the set of the water in the Arctic Ocean.

Dogs as Food.—One of the main problems of Arctic exploration has been to find food for the dogs which drag the provisions of the men. Mr. Baldwin has a hundred tons of dog food, but does not depend on that alone for the subsistence of his draft animals. It is his intention to cause a portion of this food to transport itself; that is, he means to carry along, loose, less efficient dogs as food for those which are better able to stand the strain of hauling the sledges. To use the weakest dogs as food for the strongest, has been, as a matter of fact, the practice of all Arctic explorers; but none has equipped himself for the purpose as deliberately as has Mr. Baldwin. He has 420 dogs—no other expedition has had more than a third of the number. Another device of his is to cause the dogs which are not dragging sledges to bear their own provisions in packs fastened on their backs. He has also fifteen Siberian draft ponies, intended to do the heavy work in the first stages of his journey, and ultimately to become dog food.

Mr. Baldwin's Party.—To carry out the various duties which such a large expedition demands, Mr. Baldwin has forty-one men, including six Siberian dog drivers. His first aim is avowedly to reach the North Pole; but he does not mean to neglect scientific observations, and has a full set of scientific instruments to determine the meteorology, the terrestrial magnetism, the geodesy, the tides, and the topography of Franz Josef Land. He has a very complete photographic apparatus, including even a moving-picture machine. Mr. Baldwin himself is a meteorologist, and among his comrades are men especially equipped to fill each scientific function of the expedition.

Movements of the Expedition.—The three vessels foregathered at Tromsø, Norway. The *Frithjof* left July 17, 1901, for Cape Flora, bearing a party of hunters who were to begin the campaign by shooting walrus and white bear for dog food. The *Belgica* left Sandefjord July 25, for either Koldeway Island or Shannon Island on the Greenland coast, bearing three houses, sledges, food to be deposited along the Greenland coast sufficient for twelve men for a year, and signal-poles to be erected along this coast. The *America* left with the *Frithjof*, but went first to Solombala, Russia, to pick up the dogs. After a stormy passage of three weeks, she reached Franz Josef Land August 14, and with the *Frithjof* proceeded north to Markham Sound, and established a headquarters on the southwest coast of Alger Island, 80° 20' N. 55° 52' E. The ice ahead was so thick that the *Frithjof*, which had to return and could not risk delay, did not dare to enter it. Before she left the *America* to come home, thirty-two polar bears and sixty-two walrus had been killed for dog food.

Mr. Baldwin's Plans for 1902.—It was Mr. Baldwin's intention to push the *America*

into the ice as far north as possible, and when she should become permanently beset, to advance over the ice with dogs and ponies—each of which will drag as much as twenty dogs—to the farthest attainable point and there to establish permanent headquarters. He hopes that these headquarters will be above the 83d parallel, fifty miles or so north of the point of departure selected by Mr. Peary. It is his estimate that this station will be about 550 miles from the Pole. With lightly laden sledges—only fifty to sixty pounds per draft dog, instead of the hundred pounds usually assigned to these animals—he expects to proceed rapidly. His calculation is that he can accomplish the journey to the Pole and back to Greenland in about a hundred days. He will begin to establish his advance stations on the ice about March 2, after the sun has returned from its winter's absence, and about the first of April the main sledge party will leave Franz Josef Land.

The Melville-Bryant Drift Casks.—Ever since the famous pair of breeches lost from the *Jeannette*, north of Siberia, turned up in Greenland, there has been widespread speculation as to the character of the currents which set across the North Pole. Nansen made a partial test of one of these currents. A more comprehensive test is now being conducted by means of casks placed on the ice-floes north of Behring Strait. Each cask is numbered and the latitude and longitude where it is thrown overboard is noted. The plan originated with Rear-Admiral George W. Melville, the chief engineer of the United States Navy, the hero of the *Jeannette* expedition, the discoverer of De Long's remains, and the chief engineer of the Greely Relief Expedition. The president of the Philadelphia Geographical Society, Mr. Henry G. Bryant, who was the leader of one of the Peary auxiliary expeditions, and second in command of another, interested the Society in the plan, and the Society determined to provide the casks. In all, fifty casks have been placed upon the ice floes by whalers, and also by the revenue cutter *Bear*, stationed on the coast of Alaska, which began this year with fifteen casks. The casks are made of heavy oak staves bound with iron hoops, and each has a capacity of about twenty gallons and contains a sealed bottle, in which is a paper instructing the finder to note the spot where the cask was picked up, and to send the records to the nearest United States consul.

The Duc d'Abruzzi's Search Expedition.—The Duke of the Abruzzi sent an expedition in the summer of 1901 to seek traces of the three men who were lost from one of Captain Cagni's sledge expeditions in the preceding summer. The search expedition in the steamer *Capella* spent the open season in Franz Josef Land, but failed to find any traces of the missing men. A memorial to them was erected at Cape Flora.

The Ermak.—The Russian ice-breaking steamship *Ermak* in 1901 again visited the polar sea near Spitzbergen. Ostensibly her object was to aid the Russian members of the party which was measuring the magnetic arc. According to the announcement in the fall of 1900, however, her commander intended to test her powers against the Arctic ice packs with a view of a possible discovery of the Pole. Against the wide and heavy floes of the ocean she proved a failure. It was reported, however, that she had made five trips between Novaya Zemlya and Franz Josef Land.

Captain Bauendahl's Expedition.—News arrived by the Hamburg American liner *Augusta Victoria* that Captain Bauendahl, who had started in 1900 in the small fishing boat *Matador*, to reach the Pole from the north of Spitzbergen, had wintered at Dane Island, had sent his ship home, and had started with one companion, a Norwegian, to the east coast of Greenland with the intention of proceeding up the coast to the Pole.

The Magnetic Arc Measurements.—The Russians and Swedes who are measuring a magnetic arc at Spitzbergen, spent their third summer there in 1901, and the work is not yet finished. The Russians determined all the points in the triangulation which fell to their share. But the Swedes, whose department was the north of the group of islands, being obstructed by the ice, were not able to complete their task. The expedition used the steamship *Antarctic*, which was afterwards bought by Heer Nordenskjöld for his Antarctic expedition.

The Toll Expedition.—The expedition under Baron Toll, which started in 1900 to carry on explorations in Sannikoff Land, reached the Gulf of Taimur. During the sledging season, a member of the party pushed on to the Nordenskjöld Islands. Baron Toll himself began the exploration of Chelyuskin. Lieut. Kalomütseff, of Baron Toll's party, in the steamship *Zaria*, wintered in the Bay of Taimur (76° 8' N.). During the winter Lieut. Kalomütseff tried twice to reach Kamchatka overland, but without success. The *Zaria* returned to Yeneseisk for coal in the summer, and set forth again to establish a coaling station on Dickson Bay.

Future Expeditions.—Several enterprising explorers announced in 1901 the plans of expeditions by which they mean to reach the Pole. The most picturesque was that of Dr. Anschütz-Kämpfe, who intended to equip himself with a submarine boat

ARCTIC EXPLORATION.—The Baldwin-Ziegler Expedition. Evelyn B. Baldwin, Leader (Left); William Ziegler, Patron (Right). Flagship, *America*.

which should proceed beneath the ice. She was to be 70 feet long and 26 feet wide, with a capacity of 3,500 cubic feet of air—enough to last five men for 15 hours. She was to be propelled and guided, forward and up and down, by horizontal and vertical screws driven respectively by a 40 horse-power and a 5 horse-power engine. She could carry 150 tons of petroleum to feed a 220-volt accumulator. Her speed under water would be 3 knots an hour. The leader calculated that in the 15 hours during which his air would last he could make 45 knots, and that no Arctic floe could be 45 knots wide. Sometime in the course of that distance, therefore, he must come across an opening or "lead" in the ice and then he would rise to the surface and replenish his air. In case no lead should be discovered, he would find a thin place in the ice—indicated by his manometer—and blast a hole through. This plan, taken directly from Jules Verne, has been received as by no means preposterous; but it has not yet been put into execution.

Mr. Walter Wellman has announced that he too will try to reach the Pole, and that he has bought for the purpose the steamer *Magdalena*. But he has not publicly announced the details of his plans.

The Northern Magnetic Pole will be the object of an expedition announced for 1902 by R. Amundsen, a Norwegian, who was a member of the Belgian expedition to the Antarctic regions in 1898-99.

ARGENTINA, a republic on the Atlantic coast of South America. The capital is Buenos Ayres.

Area, Population, Education.—The estimated area of the 14 provinces and 9 territories is 1,113,849 square miles, and the population (census of 1895) 3,954,911. According to a French report the population of Argentina at the beginning of 1901 was 4,800,000, of whom 1,250,000 were foreigners; among these were 635,000 Italians, 250,000 Spaniards, 115,000 French, 60,000 Orientals, 20,000 English, 26,000 Chilians, 22,000 Germans, 20,000 Russians, and 20,000 Swiss. The estimated population of Buenos Ayres on April 30, 1901, was 829,896. In 1900 the immigrants numbered 105,902, of whom 84,851 came directly to Argentine ports, while the remainder first landed at Montevideo; of the 84,851, 52,143 were Italians and 20,383 Spaniards; the Germans numbered only 760.

Primary instruction is free, secular, and nominally compulsory; in 1899 the primary schools numbered 4,291, with an enrollment of 427,331 pupils. There are lycées and normal schools for secondary education, and for higher education two national and three provincial universities. The reported number of periodicals and newspapers in Argentina in March, 1901, was 739, of which 94 were dailies and 256 weeklies; 682 were published in Spanish and 24 in Italian.

Government.—The chief executive authority is vested in a president, who is elected for a term of six years, and appoints a responsible ministry; the president since October 12, 1898, has been Señor Julio A. Roca. The legislative power devolves upon congress of two houses, the senate and the house of deputies. The several states elect their own legislatures and governors.

The effective army numbers over 29,000. In October, 1901, the congress adopted a bill imposing obligatory military service; privileges, however, were granted to conscripts for purchasing exemption. The navy comprises 5 armored cruisers, 3 high-speed coast-defense cruisers, 4 coast defense armor-clads, 7 smaller gunboats and cruisers, 22 torpedo boats, 4 torpedo-boat destroyers, and a number of older craft. The naval complement, in addition to the marines, consists of 656 officers and 7,760 seamen.

Finance.—The most important sources of revenue are import duties and excise; by far the largest item of expenditure is interest on the public debt. The silver peso is worth 96.5 cents, and the paper peso about 44 cents. In 1899 the revenue was 70,978,627 pesos (26,453,972 pesos, gold, and 101,192,399 pesos, paper), and the expenditure 70,978,587 pesos. The revenue in 1900 was 65,301,119 pesos (37,937,805 pesos, gold, and 62,189,352 pesos, paper), and the expenditure 60,538,941 pesos (20,980,230 pesos, gold, and 89,906,110 pesos, paper). The estimated revenue for 1901 was 37,991,718 pesos (gold) and 63,300,000 pesos (currency), and the estimated expenditure 26,025,176 pesos (gold) and 89,940,499 pesos (currency).

According to a statement published in Buenos Ayres in the summer of 1901, the total foreign debt of Argentina, payable in gold, was 386,004,118 pesos; the internal debt amounted to 6,349,000 pesos gold, and 96,819,854 pesos currency. In 1900 the total floating debt amounted to 19,892,000 pesos. In his message to the congress in May, 1901, the president stated that, after a ten-years' suspension of amortization, service would be resumed in July, since for this purpose there was already in London a sum of £1,000,000. There was some agitation against the law promulgated in November, 1899, for the conversion of the paper currency, but it was stated in July, 1901, that the law would not be repealed, and that the president would sanction no further issue of paper money. It was expected that by the end of the year the conversion fund would reach nearly \$15,000,000. See paragraph Unification Bill.

Industries and Commerce.—As a producer of pastoral and agricultural commodities, Argentina is becoming one of the most important countries in the world. Its prominence in the production of wheat, corn, flax, linseed, and in the breeding of sheep and cattle is assured. In 1901 the estimated number of cattle in the country was 30,000,000.

The gold value of dutiable imports in 1899 was 102,080,738 pesos, and free 14,769,933 pesos—total, 116,850,671 pesos; the dutiable exports for the same year amounted to 100,868,723 pesos, and free 84,049,108 pesos—total, 184,917,831 pesos. In 1900 dutiable imports were 96,502,452 pesos, and free 16,982,617 pesos—total, 113,485,069 pesos; the dutiable exports 56,169,377 pesos, and free 98,431,035 pesos—total, 154,600,412 pesos. The total imports in 1900, accordingly, compared with those of 1899, show a decrease of 2.8 per cent. and the exports a decrease of 16.3 per cent. The chief causes for the decline of the export trade in 1900 were the foot-and-mouth disease, which caused some European countries to prohibit the importation of Argentine cattle; a falling off in the prices of wool; and floods, which caused the loss of many millions of sheep. As compared with 1899 there was a decrease in pastoral products amounting to 44,293,020 pesos, while agricultural products showed an increase of 12,270,361 pesos. Imports to Argentina by countries have been reported in gold pesos as follows:

	1899.	1900.		1899.	1900.
Great Britain...	43,671,421	38,682,753	France	10,979,690	10,897,866
Germany	12,979,937	16,635,613	Belgium	9,410,479	8,430,880
Italy	13,780,072	14,924,498	Brazil	4,806,116	3,741,877
United States...	15,466,846	13,438,529	Spain	3,197,882	3,691,998

Exports from Argentina by countries have been reported in gold pesos as follows:

	1899.	1900.		1899.	1900.
Great Britain...	21,721,591	23,800,686	United States...	7,667,523	6,882,763
Germany	29,433,663	20,070,133	Brazil	7,041,668	6,185,507
France	41,446,747	19,007,960	Italy	4,926,612	4,304,154
Belgium	24,478,370	17,980,885	Netherlands ...		3,906,082

From the foregoing figures it may be seen that in 1900 the percentages of imports and exports, respectively, were: Great Britain, 34.1 and 15.5; Germany, 14.7 and 13; Italy, 13.1 and 2.8; the United States, 11.9 and 4.5; and France, 9.6 and 12.3. In 1899 the export of wheat to Great Britain was inconsiderable, while in 1900 32.5 per cent. of the British import came from Argentina. This was 48 per cent. of the Argentine export. Of the corn export in 1900, 46 per cent. went to Great Britain.

The leading exports reported for 1900 include the following, the unit of quantity being the metric ton of 2,204.6 pounds: Wheat, 1,929,676 (70,902,729 bushels); wheat flour and bran, 106,831; corn, 713,248 (28,079,224 bushels); wool, 101,113 (222,915,720 pounds); linseed, 223,257; hay, 102,836; sheepskins, 28,713; tallow, 17,794; ox-hides, 3,359,463 in number; frozen withers, 2,372,939 in number; quebracho, 221,223. During the first six months of 1901 there was an increase in most of the exports as compared with 1900, excepting wheat, in which there was a heavy decline. The foreign shipping entered in 1898 aggregated 6,555,128 tons, and in 1899 6,939,567 tons.

Communications.—The railways were reported to have a total length at the beginning of 1900 of 16,413 kilometres (10,199 miles); of the 24 railway lines, 3 aggregating 2,007 kilometres belong to the state, and the remainder are private property. The private lines represent chiefly English capital, which is stated to be over \$425,600,000. In 1901 the third railway between Buenos Ayres and Rosario, 249 miles distant, was under construction. (For the Transandean Railway, see CHILE, paragraph Communications.) In 1900 there were 27,584 miles of telegraph line. The telephone lines in 1901 had a total length of 9,350 miles (27,584 kilometres); the capital invested, of which four-fifths was foreign, amounted to about \$5,060,000.

The Unification Bill.—On June 11, 1901, a bill was introduced in congress authorizing the issue, at 4 per cent., of Argentine consolidated stock, redeemable in fifty years, for the purpose of the partial or total conversion of existing foreign debts, "whenever such conversion might benefit the government." This bill, which was a government measure, was passed by the senate and by a majority of one was recommended for enactment by the finance committee of the lower house. The measure was opposed by the Argentine press and the public generally, since it was feared that a unification of the foreign debt would place Argentine finances in the power of English capitalists. A petition was laid before the congress, and the public opposition became so bitter that on July 3 and 4 riotous demonstrations took place in Buenos Ayres, and the offices of two journals favoring the administration were demolished. On July 5 a rigorous censorship was established, and in the city and suburbs a state of siege was decreed for six months. On the same day the president decided that in the interest of public convenience it was advisable to postpone

definitely the unification bill, whereupon the minister of finance resigned. The president's action caused some subsidence in the public excitement, and in a few weeks martial law was no longer necessary.

For the trouble with Chile at the end of the year, see CHILE (paragraph Events of 1901).

ARIZONA, a southwestern Territory of the United States, has an area of 112,920 square miles. The capital is Phoenix. Arizona was organized as a Territory February 24, 1863. The population in 1900 was 122,212, while in June, 1901, as estimated by the government actuary, it was 127,000. The largest city is Tucson, with a population in 1900 of 7,531.

Finances.—The receipts of the treasury for the calendar year 1901 were \$394,891.62, and the expenditures, including warrants, interest, and bonds paid, were \$355,521.60, leaving in the treasury \$104,407.20. The state tax rate for the year was 85 cents on each hundred dollars valuation. The total value of property in the Territory as returned for taxation was \$38,853,831.37. The total bonded debt was \$2,620,000, from which, however, should be deducted funded, county, and city indebtedness to the amount of \$1,634,027.57. At the same time the floating debt was \$215,347.75, giving a total territorial indebtedness, minus county and city indebtedness, of \$1,201,220.18.

Industries.—Although the census reports of 1900 show a large percentage of increase in the manufacturing interests of Arizona since 1870, the aggregate value of the products is small. The Territory is primarily a mining and stock-raising region, mechanical industries being limited to those relating essentially to the building up of new countries. During the thirty years ending with 1900, the average number of industrial wage-earners increased from 84 to 3,268. In the latter year, the amount of actual capital, exclusive of capital stock, invested in 314 establishments reporting was \$10,157,408, and the gross value of the products, inclusive of materials re-used in the process of manufacture was \$21,315,189. The smelting and refining of ores with a product in 1900 valued at \$17,286,517; car construction and repair-shop work, with a product valued at \$887,482; and the manufacture of lumber and timber products valued at \$547,790 are the most important industries; numerous so-called "neighborhood industries" exist, the products of which are consumed at or near the point of production.

Agriculture.—The main wealth of Arizona at present is in its mines, and, owing to the difficulty of irrigation and the practical impossibility of irrigating the northern part of the Territory, it appears that Arizona will never become a largely producing agricultural territory. The principal crop is alfalfa, while corn, wheat, and barley are also raised. In the southern part of the State, where the fruit orchards are dependent upon irrigation, canals have been established with considerable success. Experimental work has also been done with sugar beets, although they have not yet been produced in commercial quantities. The overshadowing importance of live-stock interests in Arizona is seen in the fact that while the improved land and buildings in 1900 had a reported value of \$13,682,960, live stock alone had a reported value of \$15,458,717. Prices for live stock were reported to have been excellent in 1901, and shipments from the Territory were very heavy. The number of cattle returned for taxation was 281,541, and of sheep 377,936. The general health conditions of all classes of live stock is said to be better than in any other part of the United States, the climate being healthful, and a wise system of sanitary laws enforced.

Irrigation.—The question of irrigation in Arizona, at least in the southern part along the Gila River and its tributary, the Salt River, is one of great importance to the future of agriculture in the Territory. Since 1890, 545 miles of canals have been constructed at a cost of \$1,508,469. Of the 5,809 farms in the Territory, 4,210 are irrigated and 1,599 are unirrigated. The average value of unirrigated land, according to the census figures, is placed at \$43.50 an acre, while that for the best irrigated land is from \$60 to \$200 an acre. But how small a proportion this irrigated land bears to the whole Territory is shown by the fact that of the 72,268,800 acres of land in Arizona, only 5,723,757 acres have been appropriated, while only 1,935,327 acres, or 2.7 per cent. of the total Territorial area, were included in farms in 1900, and of these 1,935,327 acres only 254,521 acres, or .35 per cent. of the entire area, were improved lands. Owing to the fact that the Colorado River and its tributaries in the north of Arizona flow mainly in deeply eroded cañons through regions of high plateaus, the Gila and Salt river system in the southern part of the Territory form practically the only available system for irrigation purposes. Millions of acres might here, in the governor's opinion, be made profitable for agricultural crops by building reservoirs and storing the flood waters. The storage problem, as presented by the governor in his annual report for 1901, is twofold: first, to increase the water supply in existing canal systems whose volume of water is insufficient in the dry season; and, second, to supply water for the reclamation of large areas of the so-called desert or public domain. This latter is said to be especially important, because while there are

millions of acres of government land still open, there is hardly an additional acre available until the water supply is increased. Under existing circumstances it appears impossible to induce private capital to build the great reservoirs necessary for this purpose. For, in the first place, since so much of the land belongs to the government no sufficient return would be insured to the capitalist, and, in the second place, it has been erroneously assumed from experiments made in California that reservoir building and canal digging for irrigation purposes is unprofitable in any event. On the other hand, it is doubtful if the federal government can be brought to construct these reservoirs, while the resources of Arizona are insufficient for the Territorial government to attempt the work. But if the United States would cede to the Territory the arid lands at present useless, the Territory could make these lands the basis for inducing private capital to enter upon irrigation work. This last course is especially recommended by the governor not only on the ground that the arid lands are, under existing conditions, of no possible value to the government, but on the further ground that their reclamation under Territorial supervision would indirectly reimburse the United States through the increased prosperity of the whole region.

Mining.—The mining interests of Arizona continue to increase. A new feature of its mining has been the profitable sinking of shafts to a considerable depth, it having been previously thought that the mines of Arizona were on the whole very shallow. The large production of copper continues to be sustained, the total production of electrolytic copper in the Territory in 1900 being 466,922,663 pounds. The value of the copper production for 1900 was estimated at \$17,286,517, and the output for 1901 was estimated at fully as much. Gold and silver mining continue on the same scale as previously. The estimated output of gold for the calendar year 1900 was valued at \$3,500,000, and of silver \$2,592,500. The remarkable development of the oil fields of California and Texas has greatly stimulated the search for oil in Arizona. Numerous companies have been formed and extensive tracts of land have been located and surveyed with the expectation of finding flowing wells of petroleum. Petroleum would be of very great advantage to the Territory, as the price of fuel is at present so high as greatly to retard the development of manufactures.

Needs of the Territory.—As stated by the governor in his annual report for 1901, the most pressing need of Arizona, and one to which her population and wealth undeniably entitle her, is statehood. It is not especially, as the governor remarks, for sentimental reasons that Arizona asks that this right be conferred upon her, nor is it because the present Territorial government deprives the people of practical self-government; but it is mainly because the material interests of Arizona are at present placed under a great disadvantage. For some reason, as alleged by the governor, capital is more or less suspicious of territories. New railroads, the exploitation of mines, the development of agricultural products, and the construction of storage reservoirs for irrigation are all urgently needed, and private capital from other States, it is believed, would readily come to the aid of these enterprises under a State government, whereas at present they will not. "I predict," said the governor in this connection, "that within five years after the Territory is admitted into the Union there will be created within the borders of the new State more wealth than all that is now assessed, and that the population will be quadrupled." Other recommendations made by the governor for federal legislation were: that all public lands within the Territory should be ceded to Arizona; that until these lands were ceded authority should be granted to the Territory to lease the grazing lands; that all lands within the Territory be surveyed; that a government assay office and a branch mint be established in Arizona; that an appropriation be made for artesian water exploration within the Territory; and that the government proceed with the construction of the proposed reservoir dams near San Carlos on the Gila River.

Legislation.—In compliance with the provision of an act passed by the twentieth legislative assembly, a commission known as the Code Commission, consisting of three members of the Territorial bar, was appointed to revise the statutes of the Territory and the penal code. The report of this commission was submitted to the twenty-first assembly on January 1, 1901, and its construction and adoption constituted the most important work of the session. Aside from the revision of the statutes, at the session of the twenty-first assembly an act was passed authorizing an issue of Territorial bonds in the sum of \$35,000 to cover the expenses of representation at the St. Louis Exposition in 1903; an act exempting from taxation for ten years all railroads, the construction of which should be begun within one year; the repeal of an act of the twentieth assembly requiring the payment of a poll tax before registration for voting; an act authorizing the appointment of water storage commissioners; an act providing for the construction of a reform school for vicious youth; an act making a tax levy for the Territorial prison at Yuma and passed over the veto of the governor; and an act providing for the dedication of the capitol building.

State Officers.—Governor, M. O. Murphy; secretary, Isaac T. Stoddard; treasurer,

T. W. Pemberton; auditor, G. W. Vickers; attorney-general, C. A. Ainsworth; superintendent of education, R. L. Long—all Republicans. Supreme Court: chief justice, Webster Street; associate justices, Richard E. Sloan, Fletcher M. Doan, George R. Davis—all Republicans.

ARKANSAS, a south central State of the United States, has an area of 53,045 square miles. The capital is Little Rock. Arkansas was organized as a Territory March 2, 1819, and admitted as a State June 15, 1836. The population in 1900 was 1,311,564, while in June, 1901, as estimated by the government actuary, it was 1,331,000. The populations of the largest cities in 1900 were: Little Rock, 38,307; Fort Smith, 11,587; Pine Bluff, 11,496; and Hot Springs, 9,973.

Industries.—As in many other sections of the country that are predominantly agricultural, Arkansas has shown a steady growth in manufacturing and mechanical industries during the last half century. Since 1850 the population has increased from 209,897 to 1,311,564, or 524.9 per cent.; while the average number of wage-earners in industrial pursuits has increased from 842 to 26,501, or 3,047.4 per cent. In 1900, according to the census reports, there was invested in 4,794 industrial establishments reporting, a capital of \$35,960,640, exclusive of capital stock. In the same year the gross value of manufactured products was \$44,883,783, and the net or true value of the products, exclusive of products re-used in the process of manufacture, was \$28,481,699. The leading industry of the State is the manufacture of lumber and timber. The value of these products in 1900 was \$23,959,983, or 53.4 per cent. of the total value of the manufactured products of the State in that year. This industry, which showed an increase during the decade of 167.9 per cent., is dependent upon the extensive forests in Arkansas, estimated in 1898 to cover 25,600,000 acres, or more than three-fourths of the total area of the State. In the south of the State the wood is largely pine; in the eastern alluvial districts there are extensive cyprus swamps; and in the north there are great bodies of fine oak, walnut, hickory, and ash. Related to this industry is that of planing-mill products—sash, doors, blinds, etc.—whose value in 1900 was \$2,266,522. Flour and grist milling ranks second in importance among the industries of the State, having products in 1900 valued at \$3,708,709. The manufacture of cotton-seed oil and cake, from cotton material formerly thrown away, produced values amounting to \$2,874,864 in the year. The number of cotton-ginning establishments increased from 137 in 1890 to 1,150 in 1900, or 739.4 per cent. But these figures do not include private plantation ginneries or ginneries connected with saw, grist, or cotton-seed oil machinery. Both cotton-ginning and cotton-seed oil manufacture are dependent upon the large cotton production of the State, amounting in 1899 to 719,453 bales, or 7.5 per cent. of the total production of the country. Railroad construction and repair shops produced in 1900 products valued at \$2,095,447, and publishing products valued at \$839,787. Little Rock, the largest manufacturing city in the State, produced industrial products valued at 10.3 per cent. of the total products of the State, and paid 15.9 per cent. of all industrial wages of the State.

Legislation.—Among acts passed by the Arkansas legislature in 1901 were the following: Congress was applied to under Article V. of the Constitution to propose an amendment authorizing the election of senators of the United States by direct vote. The Arkansas representatives in Congress were requested to endeavor to have federal legislation passed for the improvement of the Ouachita River so as to make it navigable at all seasons from Arkadelphia down; also to use all reasonable means to obtain an appropriation to open navigation on the St. Francis River in townships 17, 18, and 19 north, range 7, 8, and 9 east, the river being already navigable below these places and also for 100 miles above. Banks were prohibited from receiving deposits when insolvent, and the penalty for violation of this act was made a felony punishable by from three to five years' imprisonment. Foreign corporations which had not appointed an agent upon whom process might be served might be sued by service upon the auditor of the State. Cities of over 2,500 inhabitants were authorized to establish and maintain public libraries. The pension law for ex-Confederate soldiers was made more liberal. For this purpose the pension tax was increased from $\frac{1}{4}$ to $\frac{3}{4}$ of a mill on all taxable property; the pension to widows of Confederate soldiers was raised from \$25 to \$100 per annum, provided they did not own more than \$400 worth of property, and the pension given by existing law of \$100 to soldiers of the Confederate army who had been totally incapacitated from wounds received in service was extended to those who had since the war become incapacitated from any cause. Moreover to Confederate soldiers who were partially disabled from any cause a maximum of \$75 per annum was to be awarded. A collateral inheritance tax of 5 per cent. was imposed upon all property, real and personal, which was bequeathed to any one except a mother, father, husband, wife, lineal descendant, adopted child, or lineal descendant of an adopted child. A rather curious law regarding dentistry provided that in future any one desiring to practice that profession must present a certificate of graduation from an authorized dental school, or must pass an examination showing that he was "reasonably well qualified" for his profes-

sion. But no time limit of study or other specifications of what constituted "reasonable qualifications" were prescribed. By existing law, all executions in the State are private, but this law was modified so that executions for rape are to be public, it being believed that this publicity would act as a deterrent to negro crime. An act which caused a considerable sensation in college fraternity circles throughout the country was one prohibiting secret fraternities in the University of Arkansas. Under this law it was enacted that after September 1, 1901, no student who was a member of a secret fraternity should receive any class honors or compete for any prize or honor offered by the University, unless such student filed with the president of the University a renunciation of his society and an agreement to have nothing further to do with it during his attendance at the University; and no teacher was thereafter to be employed at the University unless he also filed his renunciation of the secret college fraternity to which he belonged.

Liquor Laws.—Owing to the difficulty experienced in Arkansas in preventing the sale of liquor in districts where it had been made unlawful, several acts were passed intended to make the violation of the law more difficult. It was made unlawful for any persons selling liquor where the sale was lawful to solicit orders in places where the sale was unlawful. Congress was petitioned to pass such legislation as would prevent the issuance of a United States revenue license for the manufacture or sale of alcoholic liquors in the prohibited districts; it being well known that where many persons would not hesitate to violate the State laws, very few would run the risk of running athwart the federal power. A bill similar to that of Texas, passed in 1900, designating the place where liquor is delivered as the place of the sale of liquor, and in addition, making carriers the legal agents of liquor dealers, was vetoed by the governor on the ground that the measure violated the interstate commerce law, and would cause a revulsion of feeling against the existing liquor legislation.

Labor Laws.—An act for the protection of laborers made it unlawful for a corporation to pay its laborers in any form of scrip or token of indebtedness that was not redeemable in lawful money at the regular pay day; directed the courts to construe all scrip issued by companies as promises to pay lawful money; made it unlawful for any company to coerce its employees to trade at a "company store"; and directed that if a firm or corporation charged for merchandise at its store more than a reasonable rate, or the current market rate, the employee might recover damages to double the extent that he was injured. But mining concerns employing less than 20 men were exempted from this law, and mining corporations were further favored by an amendment to the law of 1899, providing that all coal mined should be paid for by weight and should be weighed before it was screened, which amendment directed that this law should not have effect if the miners should contract or agree with their employers otherwise.

Trust Laws.—In the campaign of 1900, the passage of more stringent anti-trust laws was one of the issues of the election, and this issue was made especially prominent because Mr. Jefferson Davis, when attorney-general, had endeavored under the provisions of the existing trust law to suppress insurance companies which maintained agreements as to premium rates. Checked in this by the Supreme Court of the State, Mr. Davis ran for governor on the platform of more stringent laws, and in his inaugural message recommended that corporations which were members of a pool, wherever formed, should be prohibited from transacting any business in the State, and that any contract with a trust should be declared void. Much surprise was expressed, therefore, when bills introduced in the legislature upon the governor's recommendations, taxing life-insurance policies and franchises and making more stringent regulations generally concerning trusts, failed of passage. A further reaction from the socialistic or populist sentiment of the State a few years earlier was seen in the repeal of the law of 1897, which created a State board authorized to locate, establish, and operate railroads and telegraphs in the name of the State. And this reaction was further instanced in an act authorizing the formation, under the laws of manufacturing and other business corporations, of street railway companies to build and operate private street railways throughout the State.

Other Legislation.—The powers of municipal corporations were enlarged so that they might construct, acquire, and operate municipal lighting plants. The franchises and all other railroad property which might be acquired by lease by another railroad company was made subject to the lessee maintaining the property in good condition and affording reasonably prompt traveling facilities to the public. Another act regarding railroads provided that all passenger trains on the St. Louis, Iron Mountain and Southern Railway Company, excepting trains No. 55 and 56, known as the "Cannon Ball," should be required to stop at Corning, in Clay County. The exception made by the law was probably due to recent decisions of the United States Supreme Court in the case of Illinois and other States holding that through

trains doing an interstate commerce business were not under the jurisdiction of State authorities.

State Officers.—Holding office in 1901 and through 1902: Governor, Jefferson Davis, Democrat, elected for 2 years, term expires in January, 1903; secretary of state, John W. Crockett; auditor, T. C. Monroe; treasurer, Thomas E. Little; attorney-general, George W. Murphy; superintendent of education, J. J. Dayne; commissioner of agriculture, Frank Hill; commissioner of public lands, John W. Colquitt. Supreme Court—Chief justice, Henry G. Bunn; associate justices, Burrill B. Battle, Simon P. Hughes, Carroll D. Wood, and James E. Riddick, all Republicans.

Congressional Representatives (57th Congress).—In the House: P. D. McCulloch, Jr., from Marianna; John S. Little, from Greenwood; Thomas C. McRae, from Prescott; Charles C. Reid, from Morrilton; Hugh A. Dinsmore, from Fayetteville, and S. Brundidge, Jr., from Searcy, all Democrats. In the Senate: James K. Jones (until 1903), from Washington, and James Berry (until 1907), from Bentonville, both Democrats.

ARMENIA and Kurdistan, Turkish territory in eastern Asia Minor, comprising the three vilayets of Erzerum, Mamuret-ul-Aziz (Kharput), and Diarbekir, and the districts of Bitlis and Van, have an estimated area of 72,491 square miles and a population variously estimated at from 2,500,000 to 5,000,000. The Armenians are Gregorian Christians, who, though retaining their own ritual, acknowledge the authority of the Pope of Rome. The persecutions which reached their climax in the atrocities of 1894 and 1895 have since continued, despite the Porte's promises of reform. From Moslem Kurds and even Turkish troops the country has suffered fire, pillage, massacre, and the outrage of its women, but no one of the Powers has intervened. Throughout July and August, 1901, desultory Kurdish outrages harassed the Bitlis district. In September conditions appeared to be most serious; the situation at Sassun was critical, and from Mush there came shocking reports of bloodshed, pillage, and fire. In that month the disturbances at Mush were quelled by the governor of Bitlis, commanding four battalions of troops. Many subsequent outrages, however, were reported, but no Turk or Kurd, it was stated in October, had been arrested since July. The authorities seemed to place all the blame on the Armenians and punished them accordingly. It was reported in November that fighting had taken place between Turkish troops and Armenians at Sassun, and in December that while quiet prevailed at Kharput outrages in the districts of Erzerum, Van, Diarbekir, and Bitlis were being continued by Hamidieh Kurds, against whom the authorities were either powerless or unwilling to act. In November, 1901, severe earthquake shocks destroyed a large part of the town of Erzerum, including the Armenian church and the Greek schools, and over a score of persons were killed.

ARMIES. See articles on the various countries.

ARMOUR, HERMAN O., American capitalist, died at Saratoga, N. Y., September 8, 1901. He was born at Stockbridge, N. Y., March 7, 1837, the brother of P. D. Armour (*q.v.*), and went into the grain commission business in Chicago in 1862. In 1875 he joined the firm of Plankinton, Armour and Co., and later became the New York representative of Armour and Co. At the time of his death he was a vice-president and director of the company.

ARMOUR, PHILIP DANFORTH, American capitalist and philanthropist, died in Chicago, January 6, 1901. He was born on a farm at Stockbridge, N. Y., May 16, 1832, and received a common-school education. In 1852, being seized with the then raging gold-fever, he traveled overland to California, most of the distance on foot. In four years he returned East with sufficient capital to establish himself in trade, which he did at Milwaukee, in the grain and warehouse business. Successful in this, he became in 1863 leading member of Armour, Plankinton and Co., pork packers, with headquarters in the same city and branches in others. In 1875 the main office was transferred to Chicago and the business absorbed that of Herman O. Armour (*q.v.*), dealer in grain and pork. Thereafter the ramifications of the business caused a reorganization. Armour and Co. was formed, Herman was sent to New York to manage the exports and two other brothers sent to Kansas City, Simeon at the head of the branch there, and Arthur as president of the Armour Bank, while Philip remained in Chicago as executive head of the system. The operations of the company increased rapidly, until now it owns more grain elevators than any house in the world, employs 50,000 persons, exports to every civilized country, while its transactions for a single year have exceeded \$102,000,000. This extraordinary success was due to the shrewdness and business sagacity of Mr. Armour, who, aside from revolutionizing the pork-packing industry, displayed a daring initiative and keenness of judgment in his market transactions that, more than merely increasing his own capital, overawed his competitors, secured unlimited credit for the house, and more than once averted serious financial distress. Out of his vast personal fortune he gave wisely and generously to works of prac-

tical charity. The chief beneficiaries of his liberality are the Armour Institute of Technology and the Armour Mission, both of Chicago, representing a combined endowment of \$2,500,000. Of his two sons, J. Ogden, the only surviving one, succeeded to the control of the allied Armour interests.

ARRAN, Fifth Earl of, **ARTHUR SAUNDERS WILLIAM CHARLES FOX GORE**, British peer, died in London, March 14, 1901. He was born January 6, 1839, and after being educated at Eton, entered the diplomatic service in 1859. He was an attaché successively at Hanover, Stuttgart, Lisbon, Vienna, and Paris, and resigned in 1864, after which, until 1884, he was a special income tax commissioner, and from 1888 until his death, lord-lieutenant of County Mayo, Ireland. In 1884 he succeeded his father as earl and in the same year was created a baron of the United Kingdom, entering the House of Lords as Baron Sudley.

ARROYO, **OSCAR**, American politician, died at New Orleans, La., November 3, 1901. He was born in Louisiana in 1823, a descendant of the original Spanish settlers from the Canary Islands. As provost-marshal of Plaquemines he was driven to Shreveport when the Union army captured New Orleans during the Civil War, and then became secretary to Governor and Confederate General Allen. At various times he served as clerk of the State Senate (1877), as secretary of state (1884), as special commissioner of Louisiana to investigate Civil War claims (1892), and as cashier of the United States mint at New Orleans.

ART STUDENTS' LEAGUE of New York, was founded in 1875 for the purpose of organizing and conducting classes in painting, drawing, modeling and composition. The home of the club is at 215 West Fifty-seventh Street, New York City. Membership, 423; number of students, 960. Advisory director, John La Farge; president, C. Y. Turner; secretary, Mary S. Lloyd.

ASBESTOS. The production of asbestos in 1900 was 1,054 short tons, valued at \$16,310, as compared with 1899, whose production was 681 short tons, valued at \$11,740 dollars. The imports in 1900 were valued at \$355,951, while those of 1899 were only \$312,068. Canada alone produced 30,641 short tons in 1900, the value of which was \$763,431. There has been developed recently a new deposit of asbestos on Belvedere Mountain, in Lowell and Lamoille townships, Vermont. The discovery and opening up of these deposits, which will no doubt produce important quantities in 1902, is of great importance, and although they may only supply second and third grades of asbestos at first, still indications point to the presence of large quantities of the mineral. At present nearly all the asbestos used in this country is obtained from deposits at Black Lake, and Thetford, Canada.

ASCENSION, an isolated island 700 miles northwest of St. Helena, is a British possession having an area of only 35 square miles, and a population of 430, consisting of officers, seamen, marines, and their families, and 177 Kroomen. It is a coaling and store depot for the British West African squadron. In April, 1901, a direct cable was laid between the island and Sierra Leone, on the African coast.

ASHANTI. See **GOLD COAST**.

ASHLEY, **WILLIAM JAMES**, economic historian and teacher, was chosen in 1901 to organize and conduct the projected school of commerce at the University of Birmingham. He was born in London, February 25, 1860, and was educated at St. Olave's Grammar School, Southwark; at Balliol College, Oxford, where he was a history scholar; and at Lincoln College, where he held a fellowship and a lectureship in 1885-88. From 1888 to 1892 he was professor of political economy and constitutional history at Toronto University, and then was called to Harvard University to become professor of economic history, a chair which he occupied until selected to organize the new faculty at Birmingham. Among his many publications on economic subjects are *Introduction to English Economic History and Theory*; *The Middle Ages* (1888); *The End of the Middle Ages* (1893); and *Surveys Historic and Economic* (1900). He was also editor of the *Economic Classics*, translating for the series Schmolli's *Mercantile System* (1896) and Turgot's *Reflections* (1898).

ASIA. For map see **PERSIA**.

ASIA MINOR. See **ARCHÆOLOGY** (paragraph Asia Minor) and **TURKEY**.

ASPHALTUM. Under asphaltum are included the purer forms of the hard and soft bitumen known as elaterite, gilsonite, albertite, wurzilite, uintaite, nigrile, maltha, brea, etc. Where the material is found forming impregnations in the porous rock it is known as bituminous rock. The production of asphaltum and bituminous rock in 1900 amounted to 54,389 short tons, valued at \$415,958, as compared with the production of 75,085 short tons, valued at \$553,904, in 1899. This quantity was supplied by the States of California, Kentucky, Utah, Texas, and Colorado. A large quantity of asphaltum and bituminous rock was also imported, most of the foreign supply coming from Trinidad and Bermudez, in Venezuela,

while smaller quantities came from Switzerland, France, Germany, Cuba, and Mexico. The value of the domestic production of 1900 was 9 per cent. less than the imports, which amounted to 118,771 long tons, valued at \$454,732. The imports from Trinidad increased nearly 36 per cent. between 1899 and 1900, and the amount imported from Venezuela was nearly three times that imported during 1899. G. H. Eldridge has prepared a valuable paper on the asphalt and bituminous rock deposits of the United States, in which he describes the distribution of the several varieties. The purer forms occur in the form of veins, of which he mentions a remarkable example found in Utah near the Colorado line, which has a maximum width of 18 feet and a continuous length of ten miles. Some of the bituminous rock deposits are very large, one being mentioned in Indian Territory which forms a bed 350 feet thick, impregnated from top to bottom and traceable for over two miles. The percentage of bitumen in the rocks shows a maximum of 14 per cent. in the case of the limestones and 20 per cent. in the case of sandstones. H. E. Peckham has written a paper *On the Bituminous Deposits Situated to the South and East of Cardenas, Cuba, American Journal of Science*, July, 1901.

ASQUITH, HERBERT HENRY, M.P., a prominent Liberal leader, in a speech at a Liberal dinner, replying to addresses delivered at a great pro-Boer mass meeting in London, on June 20, 1901, committed himself and his branch of the party to a firm support of the cause of Great Britain in the war against the Boers in South Africa. It was Mr. Asquith's contention that the Liberals were not of necessity supporters of the Boers, and he claimed the right to hold whatever opinion suited him in regard to this question, without being accused of party disloyalty. Mr. Asquith was born in Yorkshire in 1852 and was educated at the City of London School and Balliol College, Oxford. After engaging in law practice for some years, he entered Parliament (1886). His career was brilliant, and he rose to the position of home secretary under Gladstone in 1892, but left the ministry upon the defeat of the Rosebery cabinet in 1895. He is a member of the House of Commons, sitting for East Fife.

ASSEMBLY, GENERAL. See PRESBYTERIAN CHURCH IN THE UNITED STATES OF AMERICA (NORTH) and PRESBYTERIAN CHURCH IN THE UNITED STATES (SOUTH).

ASSOCIATE REFORMED SYNOD OF THE SOUTH, organized in 1821, a member of the alliance of Reformed churches holding the Presbyterian system, and the only independent division of Associate Reformed Presbyterians. According to the last reports available it has 11,344 communicants and 8,367 Sabbath school teachers and scholars, with over a hundred ministers and churches. The next meeting of the synod is in November, 1902. Stated clerk, Rev. James Boyce, Due West, S. C.

ASSOCIATED PRESS, an organization having for its object the collection and sale of news to its members among the press of the country, was first incorporated in Michigan, later in Illinois, and later still, as the outcome of a suit with the Inter-Ocean Publishing Co., of Chicago, reincorporated (1900) under the laws of the State of New York. At the annual meeting held in New York City, September 18, 1901, the following directors were elected, viz.: F. B. Noyes, Washington *Star*; C. W. Knapp, St. Louis *Republic*; V. F. Lawson, Chicago *Record*; Stephen O'Meara, Boston *Journal*; A. J. Barr, Pittsburg *Post*; H. W. Scott, Portland *Oregonian*; George Thomson, St. Paul *Despatch*; W. L. McLean, Philadelphia *Evening Bulletin*; Clark Howell, Atlanta *Constitution*; H. Ridder, New York *Staats-Zeitung*; T. G. Rapier, New Orleans *Picayune*; C. P. Taft, Cincinnati *Times-Star*; C. H. Grasty, Baltimore *Evening News*; Whitelaw Reid, New York *Tribune*; M. H. De Young, San Francisco *Chronicle*. The directors subsequently elected F. B. Noyes president and Melville E. Stone secretary and general manager.

ASSOCIATIONS BILL. See FRANCE (paragraphs on History).

ASTRONOMICAL PROGRESS DURING THE YEAR 1901. The two most interesting events of the year were the blazing forth of a new and brilliant star, and the discovery of a minor planet pursuing a specially remarkable orbit. In the following pages we have described these occurrences briefly, and have also called attention to advances made in other departments of astronomical science.

New Star in the Constellation Perseus.—Perhaps the most striking thing in 1901 was the sudden appearance of this very bright object, at a point in the sky where no star had been known to exist before. Such a phenomenon is of great importance to the advance of astronomical science, and also of high interest to the general public. It is as if a new world had come into existence suddenly before our eyes. On the morning of February 22, not very long before twilight, Anderson, of Edinburgh, first saw this star, and estimated it as being between the second and third magnitudes. Daylight soon intervened, and it was not seen again until early even-

ing twilight made it possible to attempt further observations. At seven o'clock Copeland, of the Edinburgh observatory, saw it as a white star; and it was then almost of the first magnitude. Owing to difference in time, it was not possible to observe the star in the United States until a few hours later, since darkness always sets in on the European side of the Atlantic while it is still early afternoon in America. When it was observed at Harvard College on the evening of the 22nd it was described as a white star and its magnitude was estimated to be 0.9. This fractional designation of magnitude signifies that the observers thought it more brilliant than an average star of the first magnitude; for it must not be supposed that all the so-called first magnitude stars are really equal in brilliancy. Probably no two stars in the sky are exactly alike; and astronomers have adopted as the standard first magnitude a brilliancy near the average of the so-called first magnitude stars. Thus, stars like Sirius, that are more brilliant than the average first magnitude, are designated by fractional or even negative numbers; so that the magnitude assigned by the Harvard College observers to the new star simply indicates that they considered it somewhat brighter than the standard first magnitude. Even more remarkable fluctuations of light soon followed; for later in the same evening the magnitude was estimated as 0.35; and after the lapse of twenty-four hours, on the night of the 23rd, the new star culminated by blazing up to a brilliancy almost equaling the brightest star in the heavens. Its light-giving power could be estimated only approximately, and was set down as 0.0. One night later, on the 24th, observers all agreed that the object had already lost some of its extraordinary splendor. In thus blazing up within a few hours from absolute invisibility to such an extraordinary degree of luminosity the Perseus Nova has but one or two parallels in the written annals of astronomy. We have on record but fourteen cases of these so-called temporary stars or *Novæ*. They always appear suddenly, reach their greatest power within a few days, and then fade out again more slowly, in a period of time measurable by months. The first authenticated instance occurred in the year 134 B. C.; and this was the star which led Hipparchus to construct the first stellar catalogue ever made. Hipparchus saw the importance of the event which had come under his observation, and recognized that similar occurrences could be detected easily in the future, if an accurate record were made of the stars then actually visible in the sky.

The star most nearly resembling the one of this year appeared in November, 1572, in the constellation Cassiopeia. This *nova* first attracted the attention of Tycho Brahe to astronomical studies, and may be regarded as the primary cause of the advances our science owes to the labors of that remarkable man. Tycho was able to observe his star for sixteen months; and it is recorded that when brightest it rivaled even the planet Venus at her best. The position of the star was measured with respect to a number of neighboring ones by Tycho; so that we know, at least approximately, the exact point of the sky where it appeared. His results were published in 1573.

The further light changes of the star of 1901, as we have already mentioned, began with the decline first observed on the 24th of February. This decline continued; and by the latter part of March the *nova* was no longer a conspicuous object, though it continued to be visible in the telescope. Several times it was noted that the light fluctuated; its steady diminution seemed to be interrupted for a few days by slight increase in brilliancy.

Astronomers have given much attention to possible explanations of the phenomena of temporary stars. In the case of the present object we have been able to add considerably to our stock of observational material by noting the changes made visible by the spectroscope. Probably the most reasonable theory to account for the whole phenomenon is the so-called "Collision Theory." If a massive dark body, moving very rapidly through space, were to come into collision with some other similar body, the force of impact would undoubtedly evolve an enormous quantity of heat. This would raise the temperature of the two bodies until the matter composing them would be melted and later perhaps even vaporized wholly or in part. Such an evolution of heat would naturally be accompanied also with the production of light; in other words, we should be able to see something where previously there had been but one or more dark bodies. It is possible that space contains regions of considerable extent filled with some sort of cosmic matter, possibly very attenuated, possibly varying in density in different parts. The phenomenon of a new star could be well explained on the supposition of a compact dark mass moving very rapidly through some such region as this. We have not space to enter here into the rather intricate details of spectroscopic observations, which offer the greatest difficulties to theorists; but nearly all the facts that have become known might be due to a collision of the kind just mentioned.

Later in 1901 the new star began to show certain extraordinary changes that will probably render it absolutely unique in the class to which it belongs. In the latter

part of August the *nova* appeared to be surrounded with a species of nebulosity,—as if the materials composing the star were widening out. These appearances were especially well shown in photographs. Some astronomers were of opinion at the time that they were not caused by real nebular matter surrounding the *nova*, but that there was some peculiarity in the kind of light emanating from it which might be made to account for the observations. For instance, it might happen that the light of the *nova* was such that a photographic telescope accurately focused for the kind of light received from ordinary stars would be out of focus for the kind of light from the new star. In other words, to make a good photograph of the *nova* it might be necessary to alter somewhat from their ordinary positions the screws by which the photographic plate is adjusted to the focal plane of the telescope. Of course, if the photographs were made out of focus one would expect a sort of halo surrounding the star's image on the plate. But these notions were soon overcome by further experiment and observation; and it is now practically certain that the *nova* has actually put out a nebula. It is not possible to emphasize too strongly the interest and importance of this observation. The unfolding thus of successive early steps in a cosmic evolutionary development actually under the very eyes of the observer is an opportunity never before offered to astronomical science.

The observations thus far described are not all; at the present time of writing it is not possible to foretell just what developments will take place. But certain observations made at the very end of the year, at the Lick Observatory in California, foreshadow developments even more startling than those described. On November 11 telegraphic information was sent out to astronomers that Perrine, of the Lick Observatory, had photographed the *nova*, and found that the nebula surrounding it had at least four condensations, or *nuclei*, and that these were in motion towards the southeast. On the 12th it was announced from the Yerkes Observatory that Ritchey had been able to confirm these motions of the nebular matter from a photograph taken November 9. The motion was such as to amount to one minute of arc in six weeks; and this velocity is very many times larger than the thwart motion across the sky of any other object in the sidereal heavens. To what vast linear translation such an apparent motion may correspond it is impossible to say. If we knew the distance separating us from the *nova* we could calculate how many miles per second it must move to produce an apparent displacement of one minute of arc in six weeks. If the observed motion really exists, the material composing these nuclei is changing its position in space at least as rapidly as 1,500 miles in a single second of time. It is possible, of course, that these last phenomena, more astonishing perhaps than any others connected with the new star, may be due to some form of error in the photographs, or to some optical cause, and not to really existing motions. The decision must be left to future observation; but so much is certain: the year 1901 saw one of those really great cosmic catastrophes such as require the birth or destruction of a universe to make them possible.

Total Solar Eclipse.—A total eclipse of the sun occurred on May 18, 1901, and, as usual, a number of scientific expeditions were sent out to observe it. These eclipses are never visible from more than a very small portion of the earth's surface; and not infrequently it so chances that this small portion is situated in some far-distant and inaccessible part of the earth. On the present occasion the most favorable observing stations were on the island of Sumatra, and on certain other adjacent islands. Several parties therefore went to Sumatra, proceeding from America, England, Holland, etc. It was also possible to see the eclipse from Mauritius; and an English astronomer was located there as well, since it is always desirable to view these astronomical phenomena from widely separated stations, whenever possible.

We have not space to do more than enumerate very briefly the most important results obtained. The weather at Sumatra was quite unfavorable; but the clouds, though interfering very much with the projected photographic observations, were not sufficiently continuous or dense to cause a total failure. Pictures of the corona were obtained showing very clearly the form and shape of that outermost appendage of the sun. The corona was of the type that usually appears at eclipses occurring near periods of sun-spot minimum. It would, indeed, appear that there is some connection between the sun-spots and the corona, for it has been ascertained that the frequency of these spots in any year increases and diminishes with a well-defined periodicity. Furthermore, from the few eclipses so far observed, we find that the type of corona has a similar kind of variation. The present eclipse was no exception to this highly probable rule.

The "flash" spectrum was successfully photographed once more. This is one of the most interesting observations possible at a total solar eclipse. As the eclipse progresses, and the moon's advancing edge gradually covers the sun more and more, just before complete totality, there are a few moments when we receive light exclusively from the very outermost layer of the sun's disc. The spectrum of this light

can be photographed in these few moments, and it is found to differ entirely from the ordinary solar spectrum. The differences are such that they can best be explained by assuming the solar layer from which this light comes to be gaseous and incandescent. This conclusion has been strengthened by the spectroscopic observations of the present eclipse.

Another important class of observations usually made at solar eclipses relates to the search for an "intra-Mercurial" planet. For many years astronomers have suspected the possible existence of a planet traveling around the sun in an orbit interior to that of Mercury. Such a planet would never be visible at ordinary times; for its close proximity to the sun would prevent our seeing it in the blaze of solar light, even with very powerful telescopes. During a total solar eclipse is the time to glimpse it, if ever. Photographs were made on the present occasion covering a wide region around the sun. They show many stars, some as faint as the sixth magnitude, and it is certain that they would have revealed the position of the hypothetical planet, if it were as bright as the fourth stellar magnitude. Results were altogether negative, however, and we must postpone further search to the next occasion of a total eclipse.

New Planetoid with Remarkable Orbit.—The photographic method of discovering previously unknown planetoids that is in use at the astronomical station maintained by the Observatory of Harvard College at Arequipa, Peru, led to the detection in 1901, of a little planet pursuing an orbit quite out of the ordinary. The probability of interesting results flowing from the search for new planetoids has been increased by the discovery of Eros in 1898, a discovery which will most probably add much to our knowledge of the mechanism of the solar system. On August 14, Stewart made a photograph at Arequipa upon which appeared the image of a planetoid distant only 28° from the south pole of the heavens. This is a most unusual position on the sky for a planet, since these bodies are usually found near the so-called "ecliptic," a circle which nowhere approaches either pole of the heavens nearer than 76° . The first observation stamped the planetoid as something special among its fellows, and therefore a series of photographs were at once undertaken, and from these the planet's course throughout three months has been obtained. A preliminary orbit has been computed from the photographic observations; and, as was expected, the planet turns out to have the "outside" orbit among all the planetoids. The ellipticity exceeds that of any other minor planet, being greater than those of Eva (164) or Istria (183), which pursue the most eccentric planetary orbits hitherto known.

Meteors.—Efforts were again made in 1901 to observe the November shower of Leonids. It will be remembered that a repetition of the extraordinary showers of 1799, 1833, and 1866 was expected in 1899 and 1900, but the hopes of astronomers were disappointed. It would appear that some process of perturbation arising from the gravitational attractions of the other members of our solar system has succeeded in so altering either the orbit of the meteoric masses, or the position of the denser portion of the swarm in that orbit, as to prevent a recurrence of the remarkably interesting meteoric phenomena recorded at intervals of about thirty-three years during the last century. This non-appearance of meteoric bodies was all the more disappointing because astronomers are now prepared to observe them with far better apparatus; for what formerly could have been only seen and described might have been photographed. It was hoped that the measurement of meteoric trails upon photographs taken simultaneously at stations several miles apart would have made possible the accurate calculation of the parallax of the meteors; or, in other words, the determination of their elevation above the terrestrial surface. This important experiment would have been successful beyond a doubt, if the meteors had been visible.

The attempt at observation in 1901, however, was slightly more successful than in the preceding year. Several good meteor trails were formed on the developed negatives; and perhaps some light may be thrown on meteoric problems from their measurement.

Stockwell's New "Saros."—The Chaldean astronomers of old used to predict the occurrence of eclipses by means of the so-called Saros. They had observed that these phenomena recur at intervals of eighteen years and eleven and one-third days; so that it was always easy for them to predict new eclipses by simply counting ahead from the old ones that had been observed and entered in their records. It is now possible to explain the cause of the Chaldean Saros, and to prove that it is not mathematically exact, but merely a close approximation to the facts of Nature. To bring about an eclipse, it is necessary that the orbital motions of sun, moon and earth bring these three bodies into one and the same straight line, or very nearly so. When this occurs, if the moon is between sun and earth we have a solar eclipse, because the moon cuts off the sun's light and prevents our seeing that luminary. Similarly, if the earth is between sun and moon, the solar light is cut off from the

moon, leaving that body dark and therefore invisible to us. The third alternative of the sun passing between earth and moon is, of course, impossible from the nature of the terrestrial and lunar orbits.

Now, if the orbits of earth and moon were in the same plane, there would be two eclipses in each lunar month; for the moon, in circling round the earth, would then pass through the straight line joining earth and sun twice in each revolution. One of these two eclipses would be solar, corresponding to the position of the moon when nearest the sun, and the other lunar, when the moon was on the other side of the earth, furthest from the sun. But the two orbits are not in a single plane, and therefore the moon does not necessarily pass through the line joining sun and earth in the course of each monthly revolution. But the two orbit planes have, of course, a line of intersection, a line along which the two planes meet. This line is called the line of nodes, and it is when sun and moon in their respective orbital planes happen to be near this common line at the same time that we have an eclipse.

Now, suppose an eclipse to have occurred exactly on this line of nodes. At the end of one lunar revolution around the earth, which is called a lunation, the moon would be back again at the line of nodes. Not so the sun, however; for the orbital circuit of the earth around the sun takes a solar year, not merely a lunation. Therefore, the sun would at that time appear in the sky about one-twelfth of a revolution away from the nodal line. The exact amount by which the sun thus appears to move from the nodal line in one lunation is $30^{\circ}.670$, taking account of gravitational perturbations of the orbits of earth and moon. If we calculate multiples of this number, and disregard always multiples of complete revolutions of 360° , we find that:

In	47	lunations,	distance from node is	$1^{\circ}.513$
"	88	"	"	" 179.003
"	135	"	"	" 180.516
"	223	"	"	" 359.519
"	358	"	"	" 180.035

All these numbers are near 0° , 180° , or 360° ; and they signify that if the sun and moon were exactly in the nodal line together at any moment of time, then at the expiration, for instance, of 223 lunations, they would again be within $0^{\circ}.481$ ($360^{\circ} - 359^{\circ}.519$) of the nodal line together, and this would be quite near enough to cause an eclipse. Similarly, it appears that at the end of 358 lunations, they would be within $0^{\circ}.035$ ($180^{\circ}.035 - 180^{\circ}$) of the node at the other end of the nodal line.

The period of 223 lunations is the Saros; that of 358 lunations the new cycle discovered by Stockwell. We shall proceed to consider briefly their relative merits. It is obvious at a glance that neither the Stockwell cycle nor the Saros is absolutely exact; but of the two, Stockwell's comes nearer to the truth. Its error amounts to only $0^{\circ}.035$, while that of the Saros is $0^{\circ}.481$. The effect of these small errors is to bring about a gradual accumulation which will ultimately prevent such cycles from performing their duty of eclipse prediction. It can be shown by means of mathematical calculations that the Chaldean Saros will continue to predict recurrences of the same eclipse during a period of about thirteen centuries; and during about eight of those centuries the eclipse will be what is called "central"; i. e., an eclipse of very large obscuration. After the lapse of 1,300 years, the accumulated error will prevent the Saros from again predicting recurrences of that eclipse. In the case of Stockwell's cycle, on the other hand, the duration of correct predicting is nearly three hundred centuries, during 181 of which the eclipse is central.

At a first glance, therefore, it would seem that the new cycle is a great improvement over the old Chaldean one; and such is indeed the fact, so far as the simple prediction of eclipse dates is concerned. But the Saros possesses an incidental advantage not belonging to the new cycle, and this fact will doubtless prevent its passing out of use. It so happens that the Saros period repeats the circumstances of an eclipse with considerable accuracy, as well as the date of its occurrence. Successive reappearances of an eclipse at intervals of one Saros will be similar in character, will reappear in the same terrestrial hemisphere, and be visible in nearly the same latitudes. In the Stockwell cycle, on the other hand, the reappearances jump about all over the earth as to visibility, and do not show the same kind of eclipse at each recurrence. On the whole, therefore, we may conclude that while the Stockwell cycle is of great interest and importance, it will not replace the Saros, except perhaps in cases where prediction through a very large number of centuries is a desideratum.

Universal Standard Time.—The use of standard, or zone, time instead of local time has become nearly universal. In January, 1901, Spain joined the majority of other civilized nations, and is now reckoning time by Greenwich, England. Differences of local time are a necessary and unavoidable consequence of using the sun's

daily motion as our time measurer. For the sun, after rising in the east, slowly climbs up in the sky, passes the meridian at its greatest altitude or elevation, and then sinks again to set behind the western horizon. We call the time noon when the sun is on the meridian. Therefore, it must inevitably happen that the instant of noon will not be simultaneous for the whole earth. When the sun is on the meridian of one city it will have already passed the meridians of certain other cities, and will not yet have reached the meridians of still others; and as a consequence of the direction of solar motion from east to west, it must pass the meridians of eastern cities first. In other words, when it is noon at any given place it is already afternoon in all places to the east, and not yet noon in all places to the west. Of any two places, the more easterly has the later time; when it is nine o'clock in the westerly place, for instance, it is perhaps already nine-thirty or ten in the easterly.

The quantity of such time-difference between any two places depends on how far apart they are in an east-and-west direction; the further they are, the greater their time-difference. But east-and-west distances on the earth are best measured as longitude differences; and, in fact, the difference in time between any two places can be computed at once from their longitude difference by a very simple rule. The time difference, in hours, is just one-fifteenth the longitude difference, in degrees; or fifteen degrees of longitude difference correspond to a time difference of exactly one hour. To utilize this simple relation practically, the following excellent system has come into use, after being first adopted in the United States. A series of standard longitude meridians were selected, so situated that their time-differences from Greenwich, England, are an exact number of hours, or, in a few cases, half-hours. Greenwich, where the British Royal Observatory is situated, is thus made the fundamental point for calculating the world's standard time. All other places, instead of regulating affairs by their own respective "local" times, make use of the time belonging to the nearest one of the standard meridians just mentioned. As adjacent standard meridians differ in time by one hour only, it follows that the use of standard time instead of local time can never produce an error of more than half an hour, and as this error is perfectly constant, never changing throughout the day, it remains unnoticed in the practical affairs of life.

The advantage of this form of time reckoning is simple, but most important. The differences between the times in actual use in any two cities will be an exact number of hours, instead of a number of hours, minutes, and seconds corresponding to the real difference of local time. In passing from one city to another, therefore, a traveler can reset his watch by changing the hour only; he need pay no attention to the minutes. Having proceeded from New York to Chicago, for instance, he simply sets his watch one hour slow of New York time; he can reset the watch without the necessity of comparing it with any of the Chicago regulator clocks.

We have thus reminded the reader of the underlying principles governing standard time, in order to call attention to the following table showing the time procedure actually existing in various parts of the earth at the present date. The year 1901, as we have already said, has seen the addition of one more important nation to the list, Spain. France is the only important country still remaining outside the list; but there is some prospect of the necessary legislation being effected at Paris in 1902.

Structure of the Universe.—The observatory of Tashkent has published this year an elaborate memoir by Stratonoff, in which he discusses the distribution of the stars upon the sky. This subject had already been investigated by Seeliger, Kapteyn and others, and Stratonoff's results are based upon the same observational material used by the other investigators. The method consists in dividing the surface of the sky into a large number of small equal areas, and then counting the number of stars of various magnitudes contained in each such area. These counts are not made on the sky itself, but by an examination of the more extensive existing star catalogues. Stratonoff used the Bonn catalogue of Argelander. We have not space to do more than state his general conclusions, which he has embodied in a series of charts, showing, by means of shading, the stellar density (or number stars to the square degree) in different parts of the sky. He finds that the lines of maximum density do not follow the Milky Way exactly, nor is the pole of the Galaxy the point of minimum star density. He concludes that the Milky Way is composed of a large number of close star-clusters lying side by side in space.

The Stereo-comparator.—The astronomers' armory has been strengthened this year by the addition of a new and probably powerful instrument of research, the Stereo-comparator. This instrument resembles in appearance the ordinary stereoscope intended to exhibit pictures of solid objects correctly; that is, to make them look solid instead of flat, as they do in the usual photographs. Ordinarily, solid objects look solid because they are examined with both eyes; and the short distance between the two eyes of an observer acts as a sort of base line, by means of which we can estimate, to some extent, how much nearer one side of an object is than the other. If a couple of photographs are made in a similar way with a camera provided with two lenses so adjusted that the distance between them is approximately equal to the distance between a man's eyes; and if these two photographs are examined simultaneously in an ordinary stereoscope, the observer will see a single picture, and that picture will look solid, like the object itself if examined without any instrument whatever.

Astronomers have hitherto applied these principles in photographing the heavens with but slight success; Rutherford and others have, indeed, been able to make stereographs of the moon, by taking advantage of its libration. Pairs of photographs have been secured by them, which make the moon appear solid and round when examined in the stereoscope. In other words, the changing libration of the moon was made to take the place of the base line equal to the distance between a man's eyes. Still we have never had, until the present, a satisfactory stereoscopic instrument for comparing photographs, and the reason has been an optical one, the impossibility of making lenses which would satisfy the conditions of the problem. In November, 1901, Professor Max Wolf, of Heidelberg, published an article in which he describes a new instrument which can do the work. It was designed by Dr. Pulfrich, whose success was due to the use of the modern Jena glass. With this instrument it is possible to compare two astronomical negatives, just as a pair of terrestrial photographs are examined in an ordinary stereoscope. The new instrument consists of a couple of microscopes and plate holders, so arranged that two plates can be mounted so as to admit of being adjusted separately to the proper positions for examination, and then moved simultaneously under the microscopes, until any desired part of the negatives may be brought under observation.

The first use of this instrument by Professor Wolf gave most astonishing results. Special photographs of the planets Saturn and Jupiter were made in pairs, allowing time for the planets to move slightly between the two exposures. When examined in the new instrument such a pair of plates shows the beautiful planet surrounded with his moons and apparently hung in space at an immense distance this side of the fixed stars. The latter seem to be set upon the background of an infinitely distant sky, and the planet appears where it really is, somewhere in space between us and the stars.

So far, the instrument is interesting only as giving us new and more beautiful pictures of the heavenly bodies, but it has a far more important use than this. The fixed stars are not in reality absolutely fixed in space, but many are subject to what astronomers call a proper motion of their own; that is to say, they are moving on the sky very slowly, but, nevertheless, enough to become appreciable after a long lapse of time. In the case of a few, this motion is known to be much greater than it is with the generality of stars; and it has always been an important problem of sidereal astronomy to ascertain which stars are thus moving with relative rapidity among their fellows. The old method of studying this question was to compare the positions of stars on the sky as shown in ancient star catalogues, with those now determined by the larger instruments of modern observatories. This is a slow, laborious process, involving a vast amount of observing, and intricate calculations for the reduction of the observations, so as to make them available for the comparison. Astronomical photography has done much to diminish this, since we can now

observe proper motion stars, by comparing their positions as measured on photographs taken at wide intervals of time. But even this process is laborious, though far superior to the older one. It is necessary to measure the photographs with great precision under the microscope; and the measurements are not directly available for comparison, but must first be treated by lengthy processes of calculation.

The new instrument will probably offer a means of thus comparing photographs just as they come from the astronomical camera. If made at a considerable time interval, the two photographs, when placed in the instrument, will appear but as a single picture, so far as concerns the stars whose motions have been either *nil*, or at least so small as to be inappreciable. But if there is a star anywhere on the plate which has moved decidedly more than the generality of stars, it will appear in the stereo-comparator standing out from among the others and apparently hung in space between them and the background of the sky, just as we have described in the cases of Jupiter and Saturn. Thus a mere glance at such a pair of photographs must call attention to stars undergoing large proper motions; and the observational processes of the observatories can then be directed to those special stars, rather than to a great mass of miscellaneous ones. A similar use of the new instrument will, of course, assist in the discovery of new asteroids; and thus several of the most laborious tasks hitherto imposed upon astronomers will be made extraordinarily easy.

When we come to a study of the nebulae, the powers of the new instrument promise even more. It will, of course, show us pictures of these objects far more beautiful than we have ever had, and approximating to the beauty of the objects themselves when seen through the telescope with the eye. But in addition to this, it will also aid materially in their measurement. One of the great difficulties in cataloguing the smaller nebulae arises from their great number. Photographs have been made which exhibit as many as a thousand separate nebulae on a single plate. When the astronomer endeavors to make a catalogue of so vast a number of faint objects, it is very difficult to make certain that the catalogue is complete, that no individual nebula has been passed over; and, on the other hand, it is equally difficult to make certain that no object has been entered as a nebula which is due in fact to some imperfection of the photograph and not to a real object existing in the sky. Owing to this latter difficulty it is necessary to identify and measure the position of each nebula on two plates at least before entering it in the catalogue. Now with the new instrument it is possible to examine both plates at once. When they have been suitably adjusted the observer can tell at a glance whether the given object appears on both plates, and is, therefore, real, or whether it is on one plate only, and therefore, probably a mere photographic imperfection. It is simply necessary for the observer, with one eye at each of the microscopes of the instrument, alternately to close one eye and open the other, in order to decide as to the reality of any very faint object.

The instrument has a peculiar characteristic of the ordinary stereoscope, which becomes most valuable in astronomy, though it is a species of defect in the terrestrial stereoscope. If the two photographs are not exactly alike, the observer is at once made aware of that fact by a disagreeable impression produced upon his eyes. Photographs for the ordinary stereoscope must therefore be made with special pains to have them precisely alike, and it is for this reason that they are taken simultaneously with a camera having two separate lenses, rather than at different times with the ordinary one-lens camera. This peculiarity of the instrument helps astronomers, because they are ever on the watch for changes in the sky, no matter how slight. If an astronomer has two photographs made at different times, an instrument which will enable him to detect at a glance the slightest difference between these two photographs, becomes of great importance. For instance, new variable stars can be discovered with ease. Instead of laboriously estimating magnitudes on a series of photographs, and then comparing these magnitudes with those entered in catalogues, the plates can be compared directly, and if any star has a different degree of brilliancy on any two plates, that fact will become apparent at once.

Even stellar distances from the earth may be discoverable in this way. Astronomers estimate the distances of the fixed stars by the measurement of so-called parallaxes; that is to say, the exact position on the sky of a given star is determined twice, at intervals of six months. During that time the earth has revolved half way around its annual orbit about the sun and has changed its position in space by twice the radius of its orbit, or 185 million miles. The effect of this change in the observer's position is to change the direction in which he sees any given star, if that star be within measurable distance of the earth; and this change of direction will change slightly its apparent position on the sky.

It so happens that nearly all the fixed stars are so far away that even the immense base-line of 185 million miles is too small to alter their apparent directions by a measurable amount. Still, in a few cases, the determination of distance is possible, and there may be two or three stars very much nearer to us than any of the others,

and these two or three have perhaps not yet been examined for parallax. The reason for this must be sought in the present laborious nature of a stellar parallax investigation. What is needed is a wholesale method, making possible a rapid study of the distances of a great many stars. This the new instrument promises to provide, because it is merely necessary to compare with it a couple of photographs made six months apart. If there exists the slightest parallactic displacement of any particular star among the others, caused by the six months' change of position of the earth, that star will reveal its presence at once by producing the disagreeable effect upon the eye to which we have referred. As yet Professor Wolf has examined only a few photographs of the Pleiades group in this way; and he calls attention to a couple of stars lying near the group, which he now suspects may be within measurable distance of us. The Pleiades, stars themselves, he says, appear most distinctly in a single plane.

The New Planet Eros.—This is the important asteroid discovered by Witt, of Berlin, in 1898. It may be remembered that this body pursues an orbit passing within that of Mars, and that it can approach the earth nearer than any other permanent member of the solar system, except, of course, our own moon. This remarkable peculiarity is extremely favorable to an exact determination of the distance separating us from the planet; for when a celestial body is very near us, comparatively speaking, astronomical measures make possible a more accurate computation of its distance than is possible in the case of a more distant object. Astronomers call the problem of determining distance from the earth the parallax problem, though parallax, as understood by them, is not a synonymous term with distance. Without entering into details of too technical a character, it will be sufficient to call attention to the fact, that by the aid of Newton's law of gravitation it is possible to calculate from measurements of the planetary parallax a numerical value for the solar parallax. Thus, from observations of the planet we can obtain a solution of the problem of the sun's distance from our earth. This distance is the fundamental unit for linear measures in cosmic space, and its accurate numerical evaluation has always been regarded as fundamentally the most important problem within the entire range of astronomical research. Hence the extraordinary interest of astronomers in the new planet, and the remarkable activity in its observation during the latter part of 1900 and beginning of 1901. This was a particularly favorable period to observe it with precision, and, therefore, one especially favorable also for diminishing the uncertainty still existing in our knowledge of the distance from earth to sun.

General supervision of the Eros observations has been assumed by a sub-committee of the general international committee having in charge the great photographic survey of the sidereal heavens; and a number of circulars have been published, containing directions to be followed by observers and summarizing the results obtained. In this way it will be possible to introduce some sort of uniformity into the plans for observation and computation, and thus render the final results more satisfactory. It has not yet been possible to proceed to the determination of the solar parallax, because a vast amount of preliminary computational work must first be put out of the way. This work relates to the direct preliminary reduction of the planetary observations. But the committee has been able to go far enough to report that an amount of observation material has been gathered, satisfactory both as to quantity and quality; and we may look forward within a couple of years to a new definitive calculation of the sun's distance.

One other peculiarity of interest has been discovered in connection with Eros. In the spring of 1901 it was announced that Oppolzer of Potsdam had found the light received from Eros to be decidedly variable in amount; and this remarkable observation has been fully verified by other observers. The only plausible explanation of this phenomenon supposes the planet to be in rotation, and that it has different degrees of luminosity or reflecting power on opposite sides, or else is composed of two bodies that mutually eclipse during their rotations, after the manner of certain variable stars. Doubtless one of these explanations will be ultimately found to be correct; and if so, we have here still another novelty of great interest in connection with this new planet.

Distance of Faint Stars.—The Observatory of Yale University has been engaged for many years in the measurement of stellar distances from the earth. This is one of the most difficult problems of astronomy; for even the nearest of the fixed stars is so extremely far from us that the observational determination of its distance almost eludes the powers even of the most delicate instruments of precise measurement. Moreover, the process of measurement is a very laborious and time-consuming one; so that it has been applied to a small number of stars only. When selecting an object for the experiment, astronomers are guided usually by one of two considerations; either they take a very bright star in the hope that great brilliancy indicates at least comparative proximity, or else they take a star of large

so-called "proper motion." To understand why this last condition is probably an indication of nearness or space, it is merely necessary to remember that the "fixed" stars are not really unmoving in the exact sense of the word, but are subject to extremely minute progressive displacements on the face of the sky. These displacements are doubtless due to real motions of the stars in space; and it is easy to see that a given linear velocity of motion would appear relatively big to us if it occurred in the case of a star comparatively near. So if we select stars that have large apparent motions, and ascribe such apparently large motions to proximity rather than to actual speed, we may expect nearness, speaking comparatively, of course. In 1897 the Yale Observatory published determinations of stellar distances for all the brightest stars in the sky, so far as visible from New Haven. To these have now been added ninety-two new determinations of faint stars with large "proper motions." None of these stars was found to be especially near us, however, and so this last attack on the problem of sidereal distance, like all others so far made, has failed to reveal the existence of a real neighbor in cosmic space.

The Sun's Motion.—As the central governing body of the solar system, the sun, of course, appears as a vast immovable body with all the attendant planets circling round it. But regarded from the standpoint of cosmic sidereal astronomy, the sun is but an ordinary star, subject to the same laws and changes that affect other similar stars in space. We have had occasion several times to refer to the subject of stellar "proper motion," by which we mean slow progressive changes in the stars' positions on the sky, due to corresponding linear motions in space. Now, if our sun is a star, it is probably subject to just such a motion; and it has, in fact, been known for many years that such is actually the case. Herschel recognized that if the sun, drawing the attendant planets after him, is traveling through space, there must be a point on the sky towards which his motion is aimed; and there must be an opposite point also, from which such motion must seem to proceed. He called the first point the apex of solar motion, and the other the anti-apex. Now, it is at once evident that as we move towards the apex, the constellations near that point must appear to open out, and those near the anti-apex to close in. Herschel was able to show from a comparison of the stars' positions on the sky as contained in older star catalogues with those made in his day, that the position of the apex on the sky can be approximately determined, and that it lies in the constellation Hercules. About a score of other astronomers have made similar researches since Herschel's time, using, of course, the steadily accumulating observations of star-positions to render their results increasingly accurate. But they all agree, more or less, with Herschel's original examination of the question.

When a scientific fact has thus been established by a large number of investigators, all working more or less by the same method, it is considered most desirable that a verification be secured through the use of some new and entirely different method. Such a possibility was opened up by the discovery that it is possible to measure directly with the spectroscope the velocity with which any given star is approaching us in space, or receding from us, as the case may be. Of course, such a measurement always gives us the sum or difference of the motions belonging to the star under observation, and to the solar system itself. If we find, for instance, that a certain star is approaching at the rate of ten miles per second, we cannot distinguish directly whether this approach is due to our own motion, or to the star's. But if we measure a very large number of different stars, we may assume with safety that their respective motions of approach or recession will arrange themselves according to the laws of chance,—that they will, in the average, balance each other, and that their algebraic sum is therefore zero. During the present year Campbell has published a determination of the solar motion based on spectroscopic observations made at the Lick Observatory, using the foregoing assumption. He employed 280 stars, and it is most gratifying to find that his result for the apical position is in substantial agreement with that obtained from the older methods of observation.

Velocity of Alpha Persei.—A number of spectroscopic observations of this star were made public in 1901; and these are of great interest as illustrating the inherent difficulty of the so-called "line-of-sight" work, the great delicacy required of the observer, and the extreme care that must be taken to avoid accepting conclusions as real when they are doubtful or even erroneous. We have had occasion to refer several times to the possibility of measuring with the spectroscope the linear velocity in miles per second with which any given star is approaching the solar system or receding from it. According to the principle underlying this class of measurements, we shall, of course, if the star is approaching us, receive more light-waves in a second than we should get from a stationary source of light; and if it is receding, we shall receive fewer light-waves. We can easily compare the spectrum with one produced by a stationary source of light in the observatory, and from such a comparison can ascertain whether the star is coming or going, and with what rapidity.

Observations of this kind have led to some very remarkable results, quite worthy to rank among the most important discoveries thus far made.

Sometimes a star is found to have an unvarying velocity. No matter how frequently the observations are repeated the rate of approach or recession is the same, except that slight differences occur which can be reasonably ascribed to those small residual errors of observation that are never absent from conclusions drawn by the fallible human senses. A second class of stars have a velocity which varies in a regular period. At times the star is approaching, and again it is receding with a velocity as great as was its former rate of approach; and there will be intermediate observations showing it apparently stationary, neither coming nor going. Such a phenomenon can be explained only as the result of orbital rotation. The star must be revolving around some centre, and in the course of such revolution alternately approaching and receding, with intermediate periods when the motion is at right angles to our line of sight. At such times there would, of course, be no change in the distance separating us from the star, until its orbital revolution had again changed from a direction perpendicular to our line of sight. That we cannot see the central body about which such a star may be revolving does not at all prove that it cannot exist; space must contain many such "dark stars," quite massive enough to produce effective gravitational attractions, but not luminous enough to be seen.

A third class of "line-of-sight" stars exhibit double spectra, indicating duplicity in the light-source. Where the eye or telescope can distinguish but a single star, the spectroscope shows that there actually exists a double, with its components too near together to be separated visually even by the most powerful instruments. Such a case corresponds to the preceding one, with this difference: whereas, before, we had to deal with a case of orbital revolution where one body was luminous and the other non-luminous, we have now a stellar system in which both components are heated to a temperature capable of giving brilliant light. As might be expected, star spectra of this class also show periodic changes, enabling us to conclude that we are witnessing revolution in an orbit and to determine the nature of that orbit.

Alpha Persei was found to be a star of the second class, having a variable velocity of motion away from the solar system; and these results were published in December, 1900. At once confirmatory observations were attempted at Potsdam and at the Lick Observatory. But at neither institution were the observers able to verify the result that had been published. It appeared that the star in question is moving slowly, but always steadily in one direction. Campbell, of the Lick Observatory, ascribed the differences to some form of observational error; and called this one of the "cases illustrating the necessity and the difficulty of eliminating systematic errors from line-of-sight work." The case of Alpha Persei is not to be regarded as a loss to spectroscopic astronomy, but rather as a gain, for in science the highest precision has always risen Phoenix-like from the ashes of error.

Photography On Curved Plates.—In making astronomical photographs upon ordinary sensitive plates such as are supplied by the regular dealers in photographic supplies, a very definite limitation exists as to the size of the picture. It will be remembered that the telescope is used in astro-photography like an ordinary camera. The photographic object glass is at one end of the tube and the plate is attached to the other end. If such a camera-telescope is pointed at a star-group, and an exposure of suitable length made, the developed negatives will show star-images scattered here and there over its entire surface. Images will be formed quite near the edges of the plate, as well as at and near its middle point. But these images will not all be of equal excellence. Those within a certain distance of the centre will be round perfect dots, but those near the edges, and especially those in the corners, if the plate be square, will be far inferior. Instead of the exact circular dot, the images will be elongated in the direction of the plate-centre, and they will not be of equal blackness throughout the whole image. They show a sort of nucleus and a surrounding portion of lesser density. These defects are, of course, a great hindrance to exact measurement under the microscope; it is impossible to bisect such images quite accurately. The cause of these imperfections is to be sought in the photographic lens and its relation to the plate. Since the plate is a flat surface, or plane, it is not everywhere equally distant from the optical centre of the lens; the middle of the plate is necessarily a little nearer the lens than are the corners. Consequently, if we adjust the plate so that it will be in best focus for the centre, the outer parts of the plate will be distinctly out of focus. They are too far from the lens. To remedy this difficulty, Wadsworth, of the Allegheny Observatory, has been experimenting with curved plates, and he reports a considerable measure of success. It is merely necessary to use the interior surface of a hollow spherical shell, in order to have all parts of the sensitive surface equally distant from the optical centre of the lens. This interior surface can be coated with the usual gelatine emulsion, and pictures can thus be made which have excellent star-images quite to the edges of the plate. This makes possible, of course, the photography of a much larger portion of

the sky's surface on a single plate,—a consideration of no small importance from a theoretical point of view. It now remains to be investigated whether the measurement of such plates under the microscope will bring out any new difficulties, or whether they will admit of being measured just as accurately and easily as the old flat plates. There does not seem to be any reason to anticipate special difficulties of this order, and thus it is extremely probable that we have here a further advance in astronomical methods of photographic observation.

Planetoids.—The following minor planets have been officially added to the list since No. 456, the last one mentioned in the *Year Book* for 1900:

Number.	Temporary Designation.	Date of Discovery.	Discoverer.	Name.
457	FJ	1900 Sept. 15	Wolf.	Alleghenia
458	FK	Sept. 21	"	
459	FM	Oct. 22	"	
460	FN	Oct. 22	"	
461	FP	Oct. 22	"	
462	FQ	Oct. 22	"	
463	FS	Oct. 31	"	
464	FV	1901 Jan. 9	"	
465	FW	Jan. 13	"	
466	FX	Jan. 17	"	
467	FY	Jan. 18	"	
468	FZ	Jan. 18	"	
469	GB	Feb. 15	"	

Comets.—Only two comets appeared during 1901. The second of these was merely a reappearance of Encke's comet, and attracted but little attention. The first, however, which was also the first comet of the twentieth century, was visible to the naked eye. It was first seen on April 23, by Halls, of Queenstown, Cape Colony (though several other persons saw it on about the same date), and had at that time a triple tail 10° long. It was not observed in the northern hemisphere, except at the Lick Observatory. The tail reached its greatest length of 30° very early in May, after which this interesting object gradually diminished until it faded out some time in August.

ASYLUMS FOR INSANE. See **INSANITY.**

ATHLETES. See **TOBACCO.**

ATHLETICS, TRACK AND FIELD. Several American athletes of note visited England during the season of 1901 and at the English National Amateur Athletic Union championships at Huddersfield captured five events. A. F. Duffy, of Georgetown, won the 100 yds. in 10s.; Kraenzlein, University of Pennsylvania, the 120 yds. hurdles in 15 3-5s.; I. K. Baxter, Pennsylvania, the high jump with 6 ft. 1 in.; and W. W. Coe, Princeton, the shot put with 45 ft. 5½ in.; at Stamford Bridge, London, June 29, Kraenzlein did the hurdles in 15 2-5s., breaking the English record. During September an Oxford-Cambridge team came to the United States, playing first against a Canadian team of university men, whom they easily defeated, and meeting a Yale-Harvard team at Berkeley Oval, New York, on September 25. The American collegians retrieved their defeat of 1899 in London by winning 6 out of 9 events, the Englishmen, as usual, excelling in the longer distances. The summaries: 100-yd. dash, N. H. Hargrave, Y., 0.10 2-5 (the men ran 105 yds. by mistake); 440-yd. run, E. C. Rust, H., 0.50; half-mile run, Rev. H. W. Workman, C., 1.55 3-5; one-mile run, F. G. Cockshott, C., 4.26 1-5; two-mile run, Rev. H. W. Workman, C., 9.50; 120-yd. hurdles, J. S. Converse, H., 0.15 3-5; high jump, J. S. Spraker, Y., 6.01½; running broad jump, J. S. Spraker, Y., 22.04; 16-pound hammer, W. A. Boal, H., 136.08.

The 26th annual games of the Intercollegiate Association of Amateur Athletes of America were held May 25, 1901, on Berkeley Oval, New York. The weather conditions were unfavorable; continuous rains had covered the track with water and rendered valueless any comparison of results with former performances. First place counted 5 points, second place 3, third place 2, and fourth place 1. Harvard won with 44 points; second, Yale, 30 5-6; third, Princeton, 16 1-5, and fourth, Cornell, 15. Other teams were Georgetown, 10 points; Michigan, 6 2-3; Pennsylvania, 5 5-6; New York and Columbia, 5 each; Bowdoin, 4; Syracuse, 1. The championships have now been won by Harvard 11 times, Yale 6, Pennsylvania 4, Columbia 3, and by Princeton once. The present cup, which goes to the College winning it the most times in 14 years, has now been won four times each by Harvard, Yale and Pennsylvania. James E. Sullivan, president of the Amateur Athletic Union, succeeded as referee the late W. B. Curtis, who had held the office for about 20 years.

Summaries: 100 yards, A. F. Duffy, Georgetown, 0.10 1-5; 220 yds., F. M. Sears, Cornell, 0.22 3-5; 440 yds., W. T. Holland, Georgetown, 0.51 3-5; half-mile, J. M. Perry, Princeton, 2.03 3-5; one mile, H. B. Clark, Harvard, 4.31 1-5; two miles, B. A. Gallagher, Cornell, 10.00; 120-yd. hurdles, E. J. Clapp, Yale, 0.16 1-5; 220-yd. hurdles, E. J. Clapp, Yale, 0.25 2-5; pole vault, Deakin, Pennsylvania, Dvorak and Fisheigh, Michigan, Hood, Hale, Coleman and Moore, Princeton (points divided), 10.09; 16-lb. shot, R. Sheldon, Yale, 40.09¼; 16-pound hammer, J. R. De Witt, Princeton, 149.04½; high jump, S. S. Jones, New York University, 5.09½; broad jump, C. V. Kennedy, Columbia, 21.06 3-5.

In the Middle West eight of the leading colleges, namely, Chicago, Illinois, Indiana, Iowa, Michigan, Minnesota, Northwestern, and Perdue, decided to meet under their own rules, in an association to be called the Conference Intercollegiate Athletic Association. The other colleges of the old W. I. A. A.—Notre Dame, Drake, Grinnell, Illinois, and Knox—were invited to participate in the meet, but they were not allowed representation in its management. They met under the name of the old Western intercollegiate body.

At the Conference meet, held at Chicago on June 1, the Western intercollegiate record for 440 yds. was reduced to 49 2-5s. and the 220-yd. hurdles to 25 2-5s. Michigan won with 38 points, followed by Wisconsin, 20; Chicago, 17; and Minnesota, 14. On the same day the smaller colleges before mentioned held their meet, in which the Western shot-putting record was raised to 40.05½.

The 15th annual games of the New England Intercollegiate Athletic Association, held May 18, were won by Williams, 32 1-6, followed by Amherst, 32; Dartmouth and Brown, each 19 1-6; Bowdoin, 18 1-6; Massachusetts Institute of Technology, 8 1-3, and Wesleyan, 6. The New England 100 yds. record, 10s., was equaled, and the broad jump record placed at 22.04. Among other dual meets, Yale beat Harvard, 57 to 47; Cornell beat Princeton, 64 to 40; Pennsylvania beat Columbia, 88 to 55; and Princeton beat Columbia, 64½ to 39½. Pennsylvania met Columbia for the first time and won, 88 to 55. On the Pacific coast, California beat Stanford, 85 to 32.

At the Pan-American Exposition national amateur championships, held at Buffalo, June 15, the world's record of 9.4-5s. for 100 yds. was equaled by Sears, of Cornell, who also won the 220 yds. in 22s. The A. A. U. all-around championships, held at the Stadium, July 4, were won by A. B. Gunn, Buffalo Y. M. C. A., with 5,739 points. The Y. M. C. A. Athletic League championships, at the Stadium in June, were won by Chicago, 42 points; second, Buffalo, 20 points. At the annual relay races given by the University of Pennsylvania, Yale won the one-mile event in 3.27 1-5, second Chicago, third Syracuse, fourth Pennsylvania; Harvard the 2-mile in 8.14, followed by Columbia, Pennsylvania, Yale, and Cornell; and the 4-mile in 18.45 2-5, followed by Pennsylvania and Cornell. The sixth annual "Marathon run," held by the Boston A. A., was won by John Caffrey, Hamilton, Ont., who reduced the record by 10m. to 2h. 29m. 23 3-5s., the distance being 24 miles 1,478.4 yds. A contestant came from Sparta, Greece, for this race, but was badly defeated. The next world's Olympian games will be held at Chicago in 1904.

At the "Open Championships of the World" held by the A. A. U. at Buffalo, September 8, the following were the events and winners: 110 yds., W. D. Eaton, Somerville, Mass., 11 2-5s.; shot-put, R. Sheldon, 46 ft. 2½ in.; 120-yds. hurdle, H. Arnold, New York, 15.4-5s.; half-mile run, A. Grant, University of Pennsylvania, 2m. 1 3-5s.; hammer throw, J. Flanagan, New York, 171 ft. 1 in.; quarter-mile hurdle race, H. Arnold, 56 1-5s.; standing high jump, R. C. Ewry, New York, 5 ft. 5¼ in.; running high jump, G. P. Serviss, New York, 6 ft. 3 in.; pole vault, A. Anderson, New York, 11 ft. 3¾ in.; 2-mile steeplechase, G. W. Orton, Philadelphia, 11m. 58s.; 8-mile cross country, Pastime A. C. team, 43m. 27 1-5s.

At Paterson, N. J., September 1, M. J. Sheridan (Pastime) threw the regulation 4¼-lb. discus 120 ft. 7¾ in. At Long Island City, September 2, John Flanagan threw the 16-lb. hammer from a 7-foot circle 171 ft. 9 inches. In Canada, at the championship games, September 21, there were fewer American contestants than usual; the performances were moderate; only one Canadian record was made, that of the pole vault, which was shifted up to 11 ft. 2 in.

The need of the establishment of athletic rules common to all the eastern colleges was emphasized on many occasions during 1901. In the Middle West there is an annual conference on the subject.

ATOMIC WEIGHTS. See CHEMISTRY.

AUDRAN, EDMOND, French composer, died in Paris, August 18, 1901. He was born at Lyons, France, April 11, 1842, and studied first in the Niedemeyer School, entering in 1856. While there he received a number of prizes for composition, and later (1861) went to Marseilles as choir master in St. Joseph's Church. M. Audran wrote, while at Marseilles, several comic operas, including *La Chercheuse d'Esprit*

(1864), *La Nivernaise* (1866), and *Le Petit Poucet* (1868). In 1881 he went to Paris, and while there composed light operas in collaboration with the librettists Chivol and Duru. With them he produced *La Mascotte*, his greatest success (1881), *La Dormeuse Eveillée* (1883), *Le Grand Mogul* (1884), and others. He wrote the music for M. Roucheron's operetta, *Miss Helyett* (1890), and produced one mass in 1873, which was sung both at Marseilles and at Paris.

AUSTRALIA, COMMONWEALTH OF. A British colonial possession comprising the five States of New South Wales, Victoria, Queensland, South Australia, and Western Australia, forming the mainland of Australia, and the island State of Tasmania.

Area and Population.—The total estimated area, including Tasmania, is 2,973,076 square miles. The population in 1891 was reported at 3,183,237, and in 1901 at 3,777,212, distributed as follows: New South Wales, 1,132,234 and 1,362,232; Victoria, 1,140,405 and 1,195,874; Queensland, 393,718 and 502,892; South Australia, 320,431 and 362,595; Western Australia, 49,782 and 182,553; Tasmania, 146,667 and 171,066. Thus for the last decade the population of Australia has increased by 593,975, or less than 19 per cent., the smallest relative increase for the last four decades, during which the population increased as follows: 1861-71, 512,279; 1871-81, 586,697; 1881-91, 930,620; and 1891-1901, 593,975. The insignificance of the increase for the period of 1891-1901 becomes still more apparent when the fact is considered that the excess of births over deaths during the decade was 588,647, which leaves only 5,328 for the increase from immigration, while during the preceding three decades the increase from immigration was 176,814, 194,709, and 393,750 respectively. The immigrants of the last decade consisted mostly of colored persons.

Government and Finance.—In accordance with the constitution adopted in 1900 the six states of New South Wales, Victoria, South Australia, Queensland, Tasmania, and Western Australia form a federal commonwealth under the crown of Great Britain. At the head of the administration is a governor-general appointed by the king, and assisted by an executive council of seven members formed by a leader of the dominant political party from among the members of both houses of Parliament. The latter body consists of a Senate and a House of Representatives. The Senate numbers 36 members (6 from each state) elected by popular vote for a period of six years. The House consists of 75 members elected in the following proportion: New South Wales, 26; Victoria, 23; Queensland, 9; South Australia, 7; Tasmania, 5; and Western Australia, 5. The members of the House are elected in the same way as the members of the Senate, and the qualifications for membership are the same in both houses. Parliament must meet not less than once a year and is convened and dissolved by the governor-general. The legislative powers of Parliament are very comprehensive, embracing, besides the ordinary affairs of state, the control of foreign corporations formed within the limits of the commonwealth, the acquisition and extension of railways, the enacting of laws affecting family relations, and the settlement of industrial disputes. The powers of the Senate are equal with those of the House, except in the case of financial legislation, which can neither originate nor be amended in the Senate. Every measure passed by both houses of Parliament must receive the approval of the governor-general in order to become law, and even then may be annulled by the king within a year after the governor-general's assent. The judicial authority of the commonwealth is vested in the federal supreme court, called the High Court of Australia, and other federal courts. Justices of the High Court are appointed by the governor-general and removed at his discretion. The function of the High Court is to determine appeals from other federal courts, from the Supreme Court of any state, or from any other court of any state from which an appeal had to be made to the King in Council at the establishment of the federation. No appeal from a decision affecting the limits *inter se* of the constitutional powers of the commonwealth or of any one or more states can be made to the King in Council unless approved by the High Court. According to the provisions of the constitution, uniform duties are to be established for the entire commonwealth two years after the establishment of the federation (1903), and from that date the granting of bounties on production or exportation of goods is to be determined by the federal government exclusively, except in the case of bounties on gold, silver, and other metals. Interstate free trade exists since the establishment of the federation, but countervailing duties are paid on all goods imported before the establishment of a uniform tariff. For ten years after the establishment of the federation the federal expenditures must not exceed one-fourth of the revenue derived from customs and excise, and the remainder is to be returned to the states or used for the payment of debts taken over by the federal government. According to the statement of Sir George Turner, the federal treasurer, the commonwealth revenue from customs and excise will amount under ordinary circumstances to about £8,950,000. In 1901 the revenue from these sources was estimated at £8,000,000, and from postal and defense service, at £2,330,750. The expenditure was estimated at £3,024,-

106, leaving a balance of £6,305,644 to be returned to the states. The expenditure for the same year on account of the federation was £205,000.

HISTORY.

The Inauguration of the Commonwealth.—The new commonwealth of Australia came into existence on the first day of January, 1901, on which date Lord Hopetoun (*q.v.*), the new governor-general, was inaugurated at Sydney, New South Wales, and the first federal ministry assumed the reins of government. Lord Hopetoun, upon his arrival in Australia in December, 1900, had asked Sir William Lyne, the premier of New South Wales, to form the first cabinet. Sir William consulted with the premiers of the other states and found that Sir George Turner, of Victoria, and Mr. Holder, of South Australia, would join a ministry only under Mr. Edmund P. Barton (*q.v.*), the "father of the Commonwealth Bill." Thereupon Sir William Lyne advised Lord Hopetoun to send for Mr. Barton, who consented to form a ministry. Mr. Barton distributed his portfolios as follows: Prime minister and minister for external affairs, Rt. Hon. E. P. Barton, New South Wales; attorney-general, Mr. Alfred Deakin, Victoria; minister for home affairs, Sir William Lyne, New South Wales; treasurer, Sir George Turner, Victoria; minister of trade and commerce, Mr. Charles C. Kingston, South Australia; minister of defense, Sir James Dickson, Queensland; postmaster-general, Sir John Forrest, Western Australia. Sir James Dickson died a few days after his appointment and Sir John Forrest was appointed his successor, he in turn being succeeded as postmaster-general by Mr. James J. Drake, of Queensland. On complaint of Tasmania that it was not represented, Mr. N. C. Lewis, the Tasmanian premier, was added as a member without portfolio, but in April he was succeeded by Sir C. O. Fysh. Thus constituted the cabinet remained throughout the year. No exact classification of the cabinet as to political affiliations is possible, but a majority of the members were protectionists. On January 17 Mr. Barton outlined the policy of the ministry as to legislation. He said they would favor a protective tariff, with reciprocity with Great Britain if possible, and bills for conciliation and arbitration of labor disputes, a transcontinental railway, woman's suffrage, and Asiatic exclusion.

The Elections: Political Parties.—On Mr. Barton's statement of policy as a platform, the ministry entered the campaign for the first federal elections, which were held on March 30. The result, which turned principally on the tariff question, was a victory for the government, although in some of the states party lines were scarcely recognized, and a majority of the members from Queensland, where the sole issue was the Kanaka labor question, could not be classified. It was admitted, however, that the government's declared protective policy would be supported even by some who were not avowed protectionists, and that the ministry had a good working majority for carrying out its programme. Before the end of the year the Labor party, aggregating only 27 members in both houses, proved itself to be the best organized party in the federal Parliament. Throughout the session it practically held the balance of power, and kept both Mr. Barton and Mr. Reid, the leader of the opposition, bidding for its votes. Its members could generally be counted upon by the government whenever the latter was willing to give a suitable *quid pro quo*. This bargaining aroused considerable criticism, the Queensland government charging, for instance, that the sugar industry in that state had been sacrificed to the Labor party's demand for the abolition of Kanaka labor. Besides the passage of this bill the Labor party secured very considerable reductions in the tariff schedule, as presented in the ministry's bill.

Legislation: Federal Defense.—The first session of the federal Parliament was opened in the Exposition Building at Melbourne on May 9, 1901, by the Duke of Cornwall. Hon. Frederic W. Holder, a strong supporter of the government and an avowed protectionist, was chosen speaker of the House of Representatives. The legislative programme was practically the same as that upon which the campaign had been fought. The early months of the session were taken up with discussions of bills providing for the administration of the federal business. The federal defense bill, which was heralded by the French press as the beginning of militarism among Anglo-Saxon peoples, was introduced in June. It practically provides for conscription, though in a disguised and contingent form. Every male between the ages of 18 and 60 is liable to military service. Ordinarily the force will be raised by voluntary enlistment. Mr. Barton explained to the House that it was not intended to create a standing army or to provide anything of the nature of continental conscription, but that it was simply intended to demonstrate to Australia itself and to the world what Australia "could do in an emergency." In proof of which it was shown that while the existing defense forces of Australia numbered 62,000, under the new bill the number available for defense would amount to 974,000.

The "Black Labor" Question.—The first evidence of the growing hostility to "black labor" was seen during the debate over the postal regulations bill, when the Labor

party forced the government to accept an amendment prohibiting the employment of black labor on any steamship holding a contract for carrying Australian mails, a provision which, if enforced, would require the "P. & O." mail steamships to discharge all their lascar deck hands and Chinese cooks. With the introduction of the immigration restriction and Pacific islander bills in July the strength of the "White Australia" party was clearly shown. The immigration bill as originally introduced placed restrictions on immigration and provided for the removal of prohibited persons. The educational test was radical, prohibiting the landing of any person who could not write 50 English words dictated by an immigration officer. The Labor party proposed amendments prohibiting absolutely the immigration of native-born Asiatics or Africans and providing for the exclusion of any person who shall come to Australia under a contract of any sort. The first was defeated on Mr. Barton's informing the House that the imperial government would not assent to any law which made color or nationality a reason for exclusion. After it was pointed out that the contract-laborer amendment would exclude even an English clergyman appointed to an Australian bishopric, it was made to apply to manual labor only and the government accepted the amendment. After the restriction as to the English language had been changed to any European language, and the bill practically remodeled on the Natal law, it was passed early in December. The Pacific Islanders' Bill (see QUEENSLAND), which provided for the gradual abolition of all Kanaka and Polynesian labor, to be complete by the end of 1906, met violent opposition. It was passed against the advice of the imperial government, and in the face of opposition from the Queensland government, which declared that it was almost entirely a Queensland question, there not being 500 Pacific Islanders in Australia outside that State. The act was passed in December, and the Queensland ministry, declaring that the sacrifice of the Queensland sugar industry was the price paid by Premier Barton for the Labor vote in Parliament, asked the imperial government that the royal assent be withheld.

Tariff and Shipping Bills.—The tariff bill which was introduced by Mr. Kingston on October 8 was a protective measure with no discrimination in favor of Great Britain. The bill proposed to raise £9,000,000 as follows: £2,100,000 by customs and excise duties on stimulants and the remainder from port duties of three sorts, fixed, composite, and ad valorem. The duties averaged about 18.7 per cent., but in the case of composite duties ran up as high as 70 per cent. An elaborate system of bonuses was provided for, especially in aid of iron-smelting and machine shops. Mr. Reid led the opposition to the bill, bringing forward a motion of "no confidence"; this was lost on November 1 by a vote of 39 to 25. The government, however, was compelled to concede reductions to the Labor party, the general result being that by the end of the year, of 74 groups examined, 38 had been reduced, composite duties were entirely abandoned, and the estimated revenue-yielding power of the bill cut by £1,168,000. A shipping bill, which gave to a federal commission almost complete control, not only of interstate commerce, but of foreign vessels engaged in Australian trade, was introduced by the government, and criticised as likely to give offense to foreign powers.

Industrial Arbitration.—Early in December a federal industrial arbitration bill, on the lines of the New Zealand act, was passed by Parliament. It makes strikes illegal, and labor unions financially responsible for their acts. A court of arbitration is established, presided over by a judge of the federal supreme court, which has most of the powers exercised by the Victoria wages boards, but is likely to prove less partisan.

Other Events of the Year.—During 1901 there developed in the State parliaments a tendency to criticise the federal Parliament. In New South Wales bitter attacks were made upon it for extravagances and for alleged invasion of State rights. On all sides it was criticised for being slow, and the trouble was generally said to be that Mr. Barton had no driving power. The estimates of the cost of the federal administration, which were raised from £300,000 to £500,000, together with the fact that large "allowances" were being made federal officials, called forth comment. It was declared that the biggest thing the Parliament had done was "talking 10,000 pages of Hansard."

In June a parliamentary commission was appointed to inquire into the advisability of adopting the decimal system of coinage, and providing for a federal coinage on that basis. The federal commission appointed to select a site for the new capital city reported three sites in New South Wales: Orange, a town 150 miles northwest of Sydney; Bumbah, 100 miles due west of Sydney; and Yass, 200 miles southwest of Sydney. Late in the year a federal flag was adopted. The accepted design has the Union Jack in the upper left-hand corner, on a blue (or, for marine, red) body, with a six-pointed star emblematic of the six federated States immediately below it. The other half contains the "southern cross."

The financial outlook in the commonwealth is not bright. All the States have

for some years been borrowing too freely, spending loan money on matters which ought to be provided for out of the revenue, and the late loans have been floated only at a great cost for brokerage. For the year ending June, 1901, the six States had used up £7,500,000 borrowed money, and in 10 years had sent to London £70,000,000 in payment of interest. This situation will undoubtedly prove a handicap to the federal government when it enters the loan market, as it must do.

Australian Policy; Growth of a National Spirit.—The dominant note in the first year of the new commonwealth's history was "nationalization" as opposed to imperialism. In a dozen different ways this spirit has manifested itself. Most interesting perhaps has been the strength of the movement for Australia to build and maintain her own fleet, which has been opposed by the British Admiralty, who prefer naturally to have the commonwealth contribute money to the British naval estimates. One critic, Dr. Fitchett, an acknowledged imperialist, says: "It would be nothing less than disaster for the British Admiralty to commit itself to a policy which is in conflict with the national sentiment and truest interest of Australia."

In November, when the question of taking charge of the administration of (British) New Guinea (*q.v.*) was under discussion in Parliament, there was an illustration of the fact that the Australians are striking out for themselves along lines formerly considered as belonging wholly to the imperial government. During the debate, the federal Parliament affirmed, unanimously almost, its desire to formulate a "Monroe doctrine" for the Pacific, opposing the further expansion of European or Asiatic nations in the Pacific, which ought henceforth to be considered Australia's "back yard." As this policy, if adopted, would almost assuredly lead to trouble with Germany, it was brought forward as an additional reason for Australia's need of a fleet. The adoption of a policy as to alien immigration and labor directly opposed to the customary imperial policy and the spirit shown in the passage of the Pacific Islander bill, contrary to Mr. Chamberlain's advice, show a remarkable tendency toward independence in legislation. And a national coinage, a national flag, and national postage stamps are only less important manifestations of the same spirit. See NEW SOUTH WALES, QUEENSLAND, SOUTH AUSTRALIA, TASMANIA, VICTORIA, and WESTERN AUSTRALIA.

AUSTRIA-HUNGARY, a constitutional monarchy of central Europe comprising the empire of Austria and the kingdom of Hungary, united under one sovereign, Franz Josef I. The capital of Austria is Vienna and of Hungary Budapest; the Delegations, a legislative body common to both countries, convene each year in each of the capitals alternately.

Area and Population.—The monarchy has a total area of 240,942 square miles, of which Austria comprises 115,903 square miles, and Hungary (including Croatia and Slavonia, 16,773 square miles) 125,039 square miles. According to the census of December 31, 1890, the population of Austria was 23,895,413 and of Hungary 17,463,791—total, 41,359,204. The census of December 31, 1900, showed the population of Austria to be 26,107,304 and of Hungary 19,203,531—total, 45,310,835. According to the latter census the population of the principal Austrian provinces were: Galicia, 7,295,538; Bohemia, 6,318,280; Lower Austria, 3,086,382; Moravia, 2,435,081; Styria, 1,356,058; Tyrol and Vorarlberg, 979,878; Upper Austria, 809,918. The population of Hungary proper was 16,691,471; Croatia and Slavonia, 2,397,249; and the town of Fiume, 38,139. In addition the military numbered 114,393. The last census showed the population of the largest Austrian cities to be: Vienna, 1,648,335; Prague, 204,478; Trieste, 178,672; Lemberg, 159,618; Gratz, 138,370; Brünn, 108,944. The population of Budapest was 713,383.

Common Government and Finance.—The executive authority rests with Franz Josef, who became emperor of Austria in December, 1848, and king of Hungary in June, 1867. The heir presumptive is the Archduke Franz Ferdinand, son of the late Archduke Karl Ludwig, brother of Franz Josef. The present relations of Austria and Hungary date from the "compromise" of 1867, which is of indefinite duration and is based on similar clauses in the constitutions of the two states. Under this compromise the common administration is directed by the emperor-king, assisted by a ministry of three members, for foreign affairs, finance, and war, who are responsible to the common legislature called the Delegations. These are two in number, composed of sixty members each; the one convenes annually at Vienna and the other at Budapest. The composition of the common ministry in 1900 was: For foreign affairs, Count Agenor M. A. Goluchowski (since May, 1895); for finance, Benjamin de Kállay (since June, 1882); for war, General E. von Krieghammer (since September, 1893). The common government deals with foreign affairs, the army, the navy, finance relating to the monarchy as a whole, customs, certain state monopolies, and the diplomatic, postal, and telegraphic services. Pursuant to a reciprocity treaty concluded in 1899, when the customs union between Austria and Hungary was formally dissolved, the common expenses of the monarchy are borne in the proportion of 65.6 per cent. for Austria and 34.4 per cent. for Hungary, and

the status of practically common customs is continued, the provisions of the treaty to expire December 31, 1907.

The monetary standard is gold and the unit of value (since January 1, 1900) the krone (crown), worth 20.3 cents. The former unit of value, still in use to a large extent by the people, was the florin, worth two kronen. The estimated revenue and expenditure have balanced as follows: For 1900, 337,348,000 kronen; for 1901, 357,034,766 kronen; for 1902, 357,814,966 kronen. The estimated receipts from customs are: For 1900, 124,950,000 kronen; for 1901, 125,039,249 kronen; for 1902, 110,541,299 kronen. By far the largest expenditure is for war and marine, the estimate being 342,118,520 kronen for 1901 and 342,568,542 kronen for 1902.

Joint debts are not contracted by the dual monarchy. A debt, however, was assumed in common when the union was effected in 1867, and this in 1900 amounted to 5,438,989,758 kronen, the charges being 191,474,110 kronen for Austria and 60,621,206 kronen for Hungary. In addition there is a floating debt amounting in 1900 to 321,978,260 kronen, of which Austria's share was 24,285,800 kronen.

Army and Navy.—On a peace footing the strength of the Austro-Hungarian army in 1900 was reported as follows: The common army consisting of fifteen army corps had 20,780 officers and 283,513 men; the Austrian *Landwehr* comprised 2,601 officers and 25,068 men, and the Hungarian *Honvédség* 3,013 officers and 26,658 men; accordingly, the active army numbered 26,454 officers and 335,239 men—the total being 361,693. On a war footing the number of officers is placed at over 45,000 and of men at about 1,827,000—total, about 1,872,000. With the various reserves the total military strength on a war footing is estimated at over 4,000,000 men.

The navy though small is efficient, and a programme is now being carried out for replacing obsolescent vessels by new ones of modern construction and effectiveness. The fleet was reported to comprise in 1900 one second-class battleship, four third-class battleships, two armored cruisers, eight protected cruisers, seven port-defense vessels, twelve torpedo gunboats, thirty-two first-class torpedo boats, thirty-one second-class torpedo boats, and eight third-class torpedo boats.

The latest addition to the navy is the *Arpad*, an armored turret battleship, which was launched on September 11, 1901. A sister ship, the *Hapsburg*, was launched in September, 1900, and a third vessel of the same type, the *Babenberg*, has been laid down. Each of these has a displacement of 8,340 tons, exceeding by over 1,400 tons the *Erzherzog Rudolf*, which was previously the largest modern vessel of the fleet. Though of comparatively small tonnage the *Arpad* has a strong armament; the indicated horse-power is 11,000; maximum speed 18.5 knots; and its coal capacity 800 tons, allowing a voyage of 3,600 geographical miles.

Government and Finance of Austria.—The executive authority is vested in the emperor and the administration is carried on by a ministry of ten members appointed by the emperor and responsible to the legislative body, the *Reichsrath*. This body consists of an upper house (*Herrenhaus*) and a lower house (*Abgeordnetenhaus*), the members of the latter being elective. Austria has no separate ministry for foreign affairs. The premier and minister of the interior since January 21, 1900, has been Dr. Ernst von Koerber. Each province has a representative diet (*Landtag*), which deals with matters not reserved for the *Reichsrath*.

The revenue and expenditure in kronen (20.3 cents) have been estimated as follows, respectively: 1900, 1,585,811,822 and 1,586,403,933; 1901, 1,641,997,585 and 1,641,163,344; 1902, 1,685,966,357 and 1,685,117,944. The consolidated debt in 1900 amounting to 3,132,060,222 kronen and the floating debt 21,456,202 kronen—total, 3,153,516,424 kronen. Interest and amortization amounted to 152,555,874 kronen.

Government and Finance of Hungary.—The administration of Hungary, including Croatia and Slavonia, is directed by a ministry of 9 members appointed by the king and responsible to the legislative body, the *Reichstag* (*Országgyűlés*). This body is bicameral; the members of the lower house are elected by popular vote. Like Austria, Hungary has no separate ministry for foreign affairs. The premier and minister of the interior since February 26, 1899, has been Koloman de Szell. In addition to representation in the *Reichstag*, Croatia-Slavonia has a separate diet.

The estimated revenue and expenditure in kronen have been reported at 1,054,513,404 and 1,052,681,821 respectively for 1900 and 1,056,582,297 and 1,056,556,417 respectively for 1901. In 1899 the consolidated debt amounted to 2,178,066,000 kronen and the total debt 4,950,450,000 kronen.

Religion and Education.—Religious toleration prevails, but the emperor-king must be a member of the Roman Catholic Church; that church is the prevailing religious influence in both Austria and Hungary, but is stronger in the former. In both countries elementary education is free and compulsory. The pupils attending the elementary schools in 1899 numbered 3,483,646 in Austria and 3,231,739 in Hungary. There are numerous institutions for secondary, higher, and technical education—the *Gymnasien* and *Realschulen*, universities and colleges, and professional schools.

Industries.—The leading industry in both Austria and Hungary is agriculture.

The principal products are wheat, barley, oats, rye, corn, potatoes, and beets. Mining and furnace industries are important. In 1899 the reported values of mining and furnace products in Austria were 208,292,372 kronen and 94,997,716 kronen respectively; in Hungary, 57,383,000 kronen and 54,970,900 kronen respectively.

The annual production of coal in Austria is over 33,000,000 tons and in Hungary between 7,000,000 and 8,000,000 tons. The annual consumption, however, is about 60,000,000 tons, the deficit being made up by imports. Throughout the monarchy there are various factories for the production of metal wares, textiles, spirits, tobacco, sugar, and other manufactures. Although the commercial and industrial situation in the fall of 1901 was more unsatisfactory than it had been in years and many industrial establishments were reducing the number of employees or shortening the hours of labor, remarkable progress has been made of late in both commerce and manufacture. This progress, especially in Hungary, has been ascribed largely to the excellent system of technical and industrial schools that have been established or fostered by the government.

Hungary, which is usually regarded as a distinctively agricultural country, has been making conspicuous efforts during the last few years to establish manufacturing industries. From 1893 to 1900 inclusive 356 new industrial establishments, including almost every kind of manufacturing, were opened, the aggregate capital employed being some \$52,600,000. Nearly all of these enterprises received aid from the government, which proposes to continue the principle of subvention in order to encourage further the establishment of factories. It has been stated that Hungary wishes to attain such a degree of industrial independence that she may abrogate that clause of the *Ausgleich* which provides for the Austro-Hungarian customs union.

Commerce.—The special commerce of the customs territory, including Bosnia and Herzegovina (*q.v.*), has been as follows, the trade in specie and bullion being excluded: 1899, imports and exports, 1,608,800,000 kronen and 1,861,600,000 kronen respectively; 1900, imports and exports, 1,683,500,000 kronen and 1,911,900,000 kronen. In the latter year the imports and exports of raw materials amounted to 995,200,000 kronen and 810,700,000 kronen respectively; partly manufactured articles, 225,900,000 kronen and 292,300,000 kronen; manufactured articles, 462,400,000 kronen and 808,900,000 kronen. The import and export of bullion and specie in 1899 amounted to 43,100,000 kronen and 71,100,000 kronen respectively; in 1900, 44,900,000 kronen and 67,200,000 kronen. The values in kronen of the leading imports in 1900 were: Cotton, 151,400,000; wool, 99,300,000; coal, coke, etc., 89,800,000; tobacco, 60,500,000; machinery, 51,200,000. The leading exports in 1900 included: Wood, 252,100,000 kronen; sugar, 178,400,000; eggs, 90,000,000; lignite, 67,800,000; cattle, etc., 62,500,000; grain, 58,600,000; horses, 56,900,000; glass, 51,600,000; leather goods, 50,400,000; malt, 50,000,000. The trade with Germany in both imports and exports far exceeds that with any other country.

According to a United States consular report the countries exporting to Austria-Hungary in 1900 were, in the order of the amounts exported: Germany, the United States, Great Britain, Italy, Russia, British India, Switzerland, France, and Brazil. The fact that the United States stands second in the list may be misleading; for, while in 1900 Germany sent to Austria-Hungary goods valued at \$127,000,000, the import from the United States amounted to only \$30,600,000. The latter amount, however, is large in comparison to the Austro-Hungarian export to the United States, which in 1900 was valued at \$7,600,000. This state of affairs causes much dissatisfaction in Austria-Hungary and is a factor in the movement for a European customs union against the United States. Such a union was widely discussed in 1901 throughout central Europe, and Austrian manufacturers and agriculturists were making an organized effort to stop the increase of American imports. It was believed in some quarters that after the expiration of the Austro-Hungarian tariff treaties necessitating a general revision of the customs laws of the country, would be followed by the erection of tariffs aimed especially against American products. This anticipated action against the United States, however, may be modified both through fear of American tariff retaliation and through the realization that the prices of the necessities of life would advance. With regard to the proposed protective league, comprising Austria-Hungary, Germany, Switzerland, Belgium, and the Netherlands, against American importations, the American consul-general at Vienna, writing in October, 1901, said that such an attempt could not be seriously considered, notwithstanding the fact that the monarchy is threatened with an influx of American goods that "tend to dwarf, if not actually destroy, many Austro-Hungarian industries."

A meeting representing both manufacturing and agricultural interests, held in Vienna in October, 1901, made the following recommendations: A revision of the customs laws looking in general toward effectively protective tariffs; special reciprocity treaties instead of the "most favored nation" principle; only short-term commercial treaties with the United States and Argentina (the great grain producing

countries); an agreement among the countries of central Europe for mutual protection against the competition of both North and South America.

Communications.—At the beginning of 1900 there were 18,738 kilometres (11,643 miles) of railway in Austria, of which 7,584 kilometres (4,712 miles) were owned by the state. At the same time the Hungarian lines aggregated 16,951 kilometres (10,530 miles), of which 7,650 kilometres (4,754 miles) were owned by the state. Accordingly, the total length of railways in the monarchy was 35,689 kilometres (22,173 miles), of which the state owned 15,234 kilometres (9,466 miles). The state operated, in addition to its own lines, many miles of private railways. The river and canal mileage navigable for steamers has been reported at 818 in Austria and 1,923 in Hungary. (For the railway and canal systems projected in 1901, see the paragraphs on History.) In 1899 Austria had 6,065 post offices and 5,371 telegraph offices; the telegraph lines aggregated 33,235 miles and the wire 100,332 miles. In the same year the Hungarian post offices numbered 4,836 and the telegraph offices 3,165; the length of telegraph lines was 14,021 miles and of wire 69,791 miles. In 1899 the receipts of the posts and telegraphs in Austria-Hungary amounted to about 144,567,000 kronen and the expenses about 118,139,000 kronen.

HISTORY (a) *Austria.*

The year 1901 was important in Austrian politics, since it marked the resumption of legislative work on the part of the *Reichsrath* after four years of obstruction caused by the mutual antipathy of the Slav and German elements. So serious did the obstructionist methods become in the preceding year that a number of clerical leaders and members of the nobility asked for a suspension of constitutional government, while among the people discouragement and indifference were prevalent and the parliamentary broils called forth only contempt. The government disregarded the counsels for a *coup d'état*, but dissolved the *Reichsrath* on September 7, 1900.

The New Reichsrath.—At the end of 1900 elections for a new lower chamber of the *Reichsrath* were in progress and they ended on the 18th of January. This chamber may be roughly divided into the Right and the Left. The Right is composed of three principal elements: the Poles of Galicia, a powerful group, conservative and Slav; the Catholics, or Clericals, who though of German blood prefer to be allied to the Catholic and conservative Poles; finally, the Czechs of Bohemia, who are liberal rather than conservative, but who make the race question of prime importance. The Left, which includes most of the Germans of Austria, comprises several groups: the Liberals, whose influence is growing weaker and weaker; the Radicals; and the Pan-Germans, whose programme under Herr Schoenerer looks towards the annexation of Austria, with the exception of the province of Galicia, to the German Empire. It is between these two general parties, the Right and the Left, that the government has been obliged to manoeuvre, and usually with little success.

The result of the elections was a surprise to the reactionary parties; the Right suffered losses, while gains were made by radical nationalism. But over twenty political groups were represented, and it seemed impossible to bring about a stable majority. The election returns were as follows, the figures in parenthesis indicating the number of deputies in the preceding parliament: The German People's party, 49 (41); German Progressives, 35 (36); German Radicals, 21, (8); Christian Socialists, 21 (27); the Free German Union, 3 (9); the Catholic People's Party, 23 (27); Young Czechs, 53 (61); Agrarian Czechs, 6 (a new group); the Czech Labor party, 4 (a new group); Czech Clericals, 2 (1); Poles, 60 (55); the Polish People's party, 9 (8); Ruthenians, 11 (9); Slovenes, 16 (17); Croats, 9 (9); Serbes, 2 (2); Italians, 19 (15); Roumanians, 5 (5); Constitutional landed proprietors, 30 (28); Conservative landed proprietors, 19 (19); Party of the Centre, 6 (6); the Moderate Party, 3 (2); Social Democrats, 10 (15); independents, 9 (20). The success of the Pan-Germans (German Radicals) in increasing their representation from 8 to 21 is of much interest, for as soon as the party demanding the annexation of Austria to Germany becomes of considerable importance, a serious international question presents itself.

The new *Reichsrath* convened at Vienna on January 31, 1901. On February 4 the emperor addressed the two houses, setting forth a programme of extensive social, economic, and industrial reforms, and appealing to the members to abandon a racial strife that brought only evil on the state. He defended the constitution "which he had granted to his estates in the exercise of his free will." This expression seemed to indicate that the emperor might, if occasion demanded, "of his free will" suspend the constitution. His plea, however, for a reconciliation of racial animosities had little effect. From the moment when the premier in September, 1900, had taken the extreme measure of dissolving the *Reichsrath* in order to extricate himself from the almost hopeless situation then existing, there seemed to be little likelihood that

the new chamber would be much better than the old; and during the greater part of the sessions of 1901 such was the case. Disorderly scenes began almost with the opening of the chamber on January 31. On February 20 such violent and obstructive tactics, arising from the question as to whether interpellations on rulings from the chair should be accepted in other languages than German, were indulged in by the Pan-Germans and the Czech extremists that the president adjourned the sitting, while soon after personal conflicts occurred between the Germans and Czechs and strong anti-Catholic and anti-Clerical demonstrations took place. The anti-Catholic, or "Los von Rom." movement, provoked especially by alleged evils connected with the confessional, persisted during the year and called forth much bitter discussion both in the *Reichsrath* and among the people.

"*Federalism.*"—During 1901 the Germans and the Czechs, who for the most part were agreed upon a common sovereign and the unity of diplomatic, commercial, and military affairs, were still bitterly opposed on matters of administrative policy. Both party programmes were the outcome of the language question. Hitherto, when the government has attempted to maintain the privileges of the German language it has encountered the opposition of the Right, led by the Czechs, who resort to obstruction as a supreme argument. When on the other hand the government has shown an inclination to establish equality of rights between the two languages the Germans would adopt an almost intractable attitude. In a general way the policy of the Germans of the Left is for the maintenance of the *status quo*—that is, the centralist régime, which favors the hegemony of the German interests and the German language; while the policy of the Right looks toward "federalism," or central government representing autonomous states—a condition that would aid the Slavic element in overcoming the German hegemony. In the latter case each state would be governed by its own majority, and the strength of the central government, the Slavs held, would not be impaired. In support of their argument they pointed to the autonomous states of the German empire. The difficulties in the way of federalism have seemed insurmountable. The Slav lacks material force; the army is not with him, and it is not likely that any circumstances will arise which will place it on his side. The eastern half of the monarchy, Hungary, would strenuously oppose the principle of federalism in Austria. Moreover, in case a trial should be made, it seems that little would be gained; in the Slavic states the Germans would be humiliated and in the German states the Slavs; the racial struggle would go on as before, and perhaps more fiercely, since the contestants would be at closer quarters.

The Premier's Economic Programme.—An entente—provisional and temporary—between the jarring sects was brought about in 1901 by Dr. von Koerber, the premier. During 1900 he had in vain attempted to effect a reconciliation, but though it was necessary to raise revenues by ordinances and though finance and industry were seriously menaced, he had refused to abandon constitutional methods. With the new *Reichsrath* he continued his policy of "dispassionate perseverance" and again attempted reconciliation between the parties not on national and political grounds—that was impossible—but on economic grounds. The task was not easy, but through a series of conferences he brought about certain mutual concessions between the Czechs and Germans, and finally his important economic programme, which he had announced at the opening of the *Reichsrath* and which was made more attractive by reason of the existing commercial and industrial depression, was taken up for consideration by the parliament. The most important parts of this programme were the measures for railways and canals.

The railway project provided principally for the construction of a system of lines in the southern provinces, for the connection of the port of Trieste with the northern districts, and for a line connecting Bohemia, Moravia, Silesia, and Galicia. The authorized expenditure, to be raised by loans distributed over the period 1901-05, was about 487,038,000 kronen. The most expensive part of the project will be the establishment of the line ending at Trieste, which will be 485 kilometres long and will cost 134,978,000 kronen. Two lines, connecting the Dalmatian ports of Spalata and Gravosa, and Bosnia with the port of Cattaro, will be of great political importance.

For many years the coal districts of Bohemia and Moravia have desired the construction of canals in order to combat the monopoly of the existing railways, but such construction has been feared on account of the great expense involved. On April 26, 1901, Dr. von Koerber introduced a bill authorizing the construction of four canals in the districts of the Danube, Elbe, Moldau, and Vistula. The bill provides that the work be begun in 1904 and be completed within twenty years, and that the expense thereof be met by a four per cent. loan, issued between 1904 and 1912 to a maximum sum of 250,000,000 kronen and redeemable in 90 years. Expenses after 1912 will be met by additional legislation. The bill provided for the following canals: From the Danube to the Oder; from this canal eastward to the Vistula and the navigable portion of the Dniester; from the Danube-Oder canal westward to the upper Elbe (and the canalization thence of the Elbe as far as

Melnik); from the Danube to the Moldau, near Budweis (and the canalization of the Moldau from Budweis to Prague). The aggregate length of these canals is variously estimated at from 992 to 1,054 miles, and they are designed to admit boats up to 600 tons burden. The total cost, which including the expenditure subsequent to 1912, will probably reach 500,000,000 kronen, will be met by proportionate contributions from the provinces, districts and towns that will benefit through the canals, and by imperial subventions. If this plan is fully carried out there will be a network of canals covering the principal provinces and connecting the main navigable streams of Austria, which will afford cheap all-water routes to the Black and Baltic seas. The measure was opposed in the *Reichsrath* by the Agrarian elements on the same grounds that the German canalization schemes are opposed by the German Agrarians, namely, that by cheapened freight rates the canals would flood the country with foreign food products, especially grain and vegetables, to the very serious detriment of the Austrian farmers. On the other hand, and again as in Germany, the proposed canals have the thorough approval of the manufacturing and commercial interests. The force of the Agrarian position was emphasized, perhaps unconsciously, by the American consul-general at Vienna, who wrote: "It is to be hoped that with the completion of these waterways our American products can be more cheaply introduced into Austria-Hungary than at present." Although serious topographical difficulties must be overcome, and for a considerable time each year the canals will be closed by ice, it is thought that the project will pay. Many parts of the interior now practically inaccessible to extensive trade can be developed, while easier communication will be provided with Germany and Russia. On June 1, 1901, the canal bill, together with the railway bill, was enacted unanimously, the opponents having absented themselves.

Besides these two great projects, the *Reichsrath* enacted a number of important bills bearing upon social conditions. Among these were a measure providing for the reduction of the working day for miners from ten to nine hours, the abolition of certain burdensome customs duties, and the imposition of an excise on spirituous liquors. A provisional budget was voted, and also a large number of bills of secondary importance looking toward the improvement of local administration. The various measures adopted called for an increase of taxes, for it was plain that to vote a thousand million kronen for expenditure and not to increase the revenue, would bring about a serious deficit; it is feared that although the revenues increase year by year there will be recurring deficits in the budget.

Renewed Obstruction.—With the convening of the fall session of the *Reichsrath*, October 17, 1901, it was clear that the *rapprochement* between the nationalities, which had never been real except on economic grounds, had come to an end. On October 23 a violent debate took place between the Czechs and the Germans, and in November there was little or no prospect of reconciliation, while important legislation was being blocked. It seemed probable that the Czechs would not obstruct the debate on the budget for 1902, which showed estimated revenue and expenditure of 1,685,966,357 kronen and 1,685,117,944 kronen respectively, but no real amelioration of the existing antagonism was expected in the near future. The *Reichsrath* reached such a degree of inefficiency that on December 10, Dr. von Koerber, for the first time, referred to the possibility of a suspension of the constitution. But though there was much provocation at the close of the year for such suspension, the government apparently feared to resort to so extreme a measure, not only on account of the resulting disapproval in Austria, but because of the action that Hungary would probably take. According to the compromise on which the dual monarchy rests, Hungary is not bound to treat with Austria unless the latter is constitutionally governed.

The Heir Presumptive.—The action of the Archduke Franz Ferdinand, in assuming in the spring of 1901 the patronage of an association for promoting Catholic denominational education, called forth angry protests from the German parties in the *Reichsrath*. It is not customary for any member of the royal family, except the emperor, to take an active part in politics, and the action of the archduke was regarded by the Germans as political. The archduke was encouraged in his rôle of "militant churchman" by hismorganatic wife, who hopes, it is thought, in the event of ultimate Clerical victory in Austria-Hungary, to be absolved from the oath of renunciation and to be recognized, on the death of Franz Josef, as empress-queen.

(b) Hungary.

The lower chamber of the Hungarian parliament that was elected in 1896 was dissolved on September 9, 1901. The elections of 1896 sent to this body 282 members of the Liberal party, which has been the dominant party in Hungary for thirty years; 48 Kossuthists, followers of Franz Kossuth, who form the so-called party of independence; 37 Nationalists, who subsequently allied themselves with the Liberals; 20 Ultramontanes, "the people's party"; 7 Ugronists, Radical Clericals; 10 independents; and the 40 deputies from Croatia-Slavonia. The history of this parliament is divided

into two distinct periods—under the ministry of Baron Banffy and under the present ministry, that of M. Koloman de Szell. In 1898 dissensions arose among the Liberals, and obstructive tactics were employed; such measures were used, especially by one of the opposition groups led by Count Albert Apponyi and M. de Horansky, that during the last year of Banffy's régime parliamentary activity was impossible. When Szell came into power (February, 1899), this group fused with the majority and thereafter the parliament succeeded in effecting a considerable amount of legislation. Among the more important laws enacted by the legislature of 1896-1901 are the following: A law denying parliamentary jurisdiction and establishing that of the court of cassation in matters electoral; a law establishing the jury system and another concerning civil and criminal procedure; a law establishing a course of administrative instruction, and another simplifying administrative routine; a law enlarging military schools; a law concerning the regulation (at least provisional) of the relations with Austria; a law concerning the condition of farm and forest laborers; and a law looking toward the eradication of electoral corruption.

The elections to the new lower chamber in the early days of October, 1901, were particularly interesting in that they were the first held under the last-mentioned law. It appears that this law, which was a project of the Szell ministry, did not accomplish all that was expected, but it is clear that political corruption, especially in Hungary, where it has long been entrenched, cannot be quickly dislodged. For the most part, the newly elected members were unknown men. The election returns showed that the Liberal party maintains a large majority, though it lost a few seats, especially to the Kossuthists. The success of the Kossuth party seemed to indicate at least a little trouble to the ministry. It is composed of men of radical tendencies, who are striving for the economic separation of Hungary from Austria and demand that the only relations common to the two countries be in the person of the emperor-king. The Liberals, on the other hand, desire the continuation of the union on the basis of the compromise of 1867. It seems not unlikely that the Kossuthists will have considerable weight in the chamber. The election showed the beginning of a new party, which though represented by only five deputies in the chamber, may exert considerable influence. This party, which represents non-Magyar nationalities, is hostile to the hegemony exercised by the Magyars; if it should develop strength, Hungary might be forced to experience vexing racial disputes such as Austria has suffered for many years.

Some of the losses of the Liberal party are worthy of note. More than eighty members of the old majority voluntarily withdrew their candidature, many of them fearing defeat. Among this number was M. Maslenovitch, the well-known economist and advocate of free trade. M. Alexander Plosz, the minister of justice, was defeated, as was also M. Koloman Tisza, the former premier, who had represented his district for thirty years. Death removed two deputies who were well known throughout Europe, M. Desider de Szilagyi (*q.v.*) and M. Auguste de Pulszky. At the time of the politico-religious reforms in 1894 de Szilagyi, as minister of justice, first in the Szapary ministry and then in the ministry of Wekerle, carried out a successful struggle in the reform movement against clerical intrigues. He retired from public life in 1895, but soon after was recalled and became president of the lower chamber, in which position he remained until 1898, when he resigned on account of the reactionary character of the Banffy ministry. As a simple deputy he exercised a great influence in the last two years of his life. Not only the Liberal party but Hungary itself has probably suffered no loss so great as that of de Szilagyi since the death of Francis Deak in 1876. Pulszky, though a man of less importance, was one of the most learned and eminent speakers of the parliament.

On October 28, 1901, the Hungarian *Reichstag* was opened by the king, who, in his speech from the throne, emphasized "the necessity of a permanent settlement of the commercial questions between Hungary and Austria, and announced a rearrangement of the customs tariff and various measures of administrative and economic reform." A principal feature of the new situation was the election of Count Albert Apponyi as president of the lower chamber on October 31, a "brilliant sanction" of the fusion that had existed for two years between the majority and the group of the centre Left. With regard to the problems before the new parliament and the necessity of a spirit of disinterested patriotism, M. Szell said a short time before the opening of the session that nothing must be permitted which could arrest the development of Hungary's economic forces, and that there was good reason to trust that both the agricultural and the commercial interests of the country would be safeguarded in the legislature. As to the relations of Hungary with Austria the premier considered the maintenance of the *status quo* as an absolute necessity. It was felt that both the agricultural and economic development of Hungary depended to a considerable extent upon the maintenance of existing relations. On the other hand it was stated in some quarters that should the disposition which had manifested itself in Austria to regard Hungary as an "agricultural colony" continue, Hungary

would not refrain from protecting itself by establishing a tariff system against Austria. In the fall the Hungarians were somewhat irritated by a speech of Dr. von Koerber, the Austrian premier, in the *Reichsrath*, in which he stated that the renewal of the customs union between the two countries was advisable, but that thereafter "absolute honesty" must be observed in carrying out the compact.

In the spring of 1901 the government had under consideration a plan which, if carried out, will supplement the projected canals of Austria. It was proposed to connect by canals the waters leading to the Black and Adriatic seas with those leading to the Baltic, and to construct a waterway from the Danube to the port of Fiume.

AUTOMOBILES. The year 1901 witnessed substantial progress in the improvement and use of the automobile both abroad and in the United States. Popular interest in the new vehicle was also quite as intense as in previous years, being kept up by long-distance races, speed trials, endurance trials, and exhibitions, and also by many serious accidents to careless drivers. In few cases, if any, have these accidents been the fault of the machine itself. On the whole it is safe to say that the automobile was a safer and more serviceable machine at the end of 1901 than it was twelve months previous. It is generally agreed also that, in America at least, the greatest improvement has been made in gasoline vehicles. Most of these improvements have been the adoption of European ideas and their adaptation to American practice and tastes. For example, the work of the year showed an increasing tendency to place the motor in front of the dash, to suppress the reach and stereotyped wagon running gear, to adopt forced circulation to motor cooling, and to increase the refinement of motor design and construction. For heavy vehicles side chain drive, and for light vehicles bevel-gear drive are becoming the accepted models. Wire wheels have almost entirely disappeared from heavy vehicles, and wooden wheels are taking their place; the wheel base is being made longer. In respect to steering gear it is to be noted that wheel gear has supplanted the lever and tiller on nearly all heavy vehicles. In steam automobiles, if we except heavy steam wagons and trucks, very few, if any, radical changes are recorded by the year's progress, and the advance among electric vehicles is even less marked.

In France and in Europe generally the status of the three types of automobile motor power, namely, steam, gasoline, and electricity, is about as follows: About the only form of light steam carriage in use is the Serpollet, and this is not much employed. Among the various types of electric vehicles used in France the Krieger, the Jenatzy, the Jeantaud, and the Mildè are the most notable. The Krieger has the steering and motor wheels in front; there are two motors, compound wound; the batteries are divided, part being in front and part in the rear; the controller is vertical, having seven positions, four ahead, one braking, and two backward; the tires on the front wheels are pneumatic and are solid on the rear wheels; and the motors are hung on springs. The Jenatzy is chain-driven, and, besides the usual hand control, is provided with a foot lever, which throws in more or less resistance and consequently regulates the speed. In the Jeantaud carriage the motor is hung on the frame and a chain drive to the rear axle is used. The Mildè vehicle resembles closely the Columbia electric carriage used in America. French gasoline automobiles are of two types, the heavy carriage and the so-called *voiturette*. As many recent American vehicles have been confessedly modeled on French precedents, some of the characteristic features of the latest French gasoline automobile may well be described. The motors now used in the heavier carriages are slow-running, the number of turns a minute, without acceleration, being limited to about 800; in motors where the stroke is short the number of turns can be accelerated up to 1,100 and 1,200 a minute. There has been recently a gradual cutting down of stroke, the diameter of the cylinder and the length of stroke being in many instances almost the same. Almost all the successful motors are of the vertical type and are placed in front of the dash. Two cylinder motors are used almost universally in carriages developing up to 8 horse-power, and four cylinder motors for powers above this. The inlet valves are so arranged as to be easily removed and examined; the extremest valves, made of special steel, are so arranged as to be readily taken out; the pistons are all fitted with oil grooves; the bearings of the crank-shaft and motor are made very large. With few rare exceptions two cylinder motors are governed, the grooves being usually of the ball type. The change gear most used is the sliding train. The carburettor is of the float-type. Recently tube ignition is being given up, and electric-spark ignition in one form or another adopted. These igniting devices are usually hand regulated. Pedal control is almost universally adopted, two pedals being used, one releasing the clutch and the other releasing the clutch and braking. Wheel-steering gear is used with a lever control of the change gear. The muffler is little used in France, no objection being raised to the noise of the exhaust. Automatic oiling devices are used. Flanged radiators are used and the cooling water is usually pumped by a high-speed centrifugal pump run by friction from the flywheel. The French *voiturette* distinguished from the heavier carriage by its use of a high-

AUTOMOBILES OF 1901.—Steam Carriage (Upper). Gasoline Touring Car (Lower).
Courtesy International Motor Car Co.

speed motor and bevel gear drive instead of chain drive. It has not attained so high a degree of perfection as the carriage.

The preceding statements relate almost solely to light vehicles; for heavy vehicles for freighting purposes, steam motive power is far in the lead of either gasoline or electricity. England, which has taken a position in the rear of most other countries in developing light motor vehicles, is far in advance of all other countries in the development of the heavy steam wagon and truck. As has been its practice for several seasons, the Liverpool Self-Propelled Traffic Association held, in the summer of 1901, a formal trial of motor vehicles for heavy traffic. Eleven vehicles were submitted for this trial, two of which were propelled by gasoline engines and nine of which were steam wagons. Three of the steam vehicles were for different reasons unable to complete the full trial. The results of the trials may be briefly summarized from the report of the judges, as follows: A gradual and marked improvement in the construction and behavior of heavy motor vehicles had taken place since the first trials made three years before, and reliance may now be placed upon the better makes for regular employment in general haulage operations where due care and supervision are exercised. At the end of 1901 there were in operation in England a considerable number of steam trucks of four and five tons carrying capacity. In France very few heavy motor trucks have been built. In Germany one firm has built a number of gasoline trucks which have operated with great success. The building of heavy motor wagons for freighting purposes seemed in 1900 to be destined to receive considerable attention in the United States, but the records of construction in 1901 have not fulfilled this promise. Indeed, these records have been distinctly disappointing in many respects.

Racing.—In the way of races, the long-distance Paris-Berlin race in June, won by M. Fournier, undoubtedly takes rank as the leading event, with the Paris-Bordeaux race as a close rival. The following figures give the essential details of these two races as compared with other long-distance contests. In a manner these figures tell the story of the automobile, because high speed means good construction. Such figures are, however, recorded only by racing machines; the tendency during 1901 was more pronounced than ever before to differentiate such vehicles from those used for pleasure and business.

Year.	Course.	Miles.	Time hrs. min.	Miles per hr.	H.-P.
1895.	Paris-Bordeaux—Paris	715	48—48	14.67	4
1896.	Paris-Marseilles—Paris	1,068	64—42	16.52	8
1898.	Paris-Amsterdam	933	33—04½	28.21	8
1899.	Tour of France.....	1,429	42—33	33.58	16
1900.	Paris-Toulouse—Paris	837	20—50	40.21	28
1901.	Paris-Bordeaux	346	6—07¾	56.48	60
1901.	Paris-Berlin	745	17—03¾	43.66	60

Perhaps the most notable short-distance races of 1901 were those over a straight-away mile course on the Coney Island Boulevard, New York City, on November 16. The results were tabulated by the *Automobile*, as follows:

In October, 1901, on the Empire one-mile oval trotting track at Yonkers, N. Y., Mr. Bostwick drove his machine 25 miles in 32 minutes 20 4-5 seconds, and subsequently covered one mile in 1 minute 13 2-5 seconds. M. Fournier on the same track drove his machine 6 miles at the average speed of a mile in 1 minute 7 5-6 seconds. But it may be seen from the foregoing table that these figures were excelled in November. It should be pointed out that the fast time of M. Fournier, Mr. Keene, and Mr. Bostwick was made with a flying start.

AZORES, a group of islands in the north Atlantic, about 1,000 miles directly west of Portugal, of which kingdom they form administratively an integral part. Their area is 1,005 square miles, and their population, which remains practically stationary, was 255,594 in 1890. Ponta Delgada, the chief town, had a population of 16,767 in 1890, and Angra, the capital, 11,067. The imports (with Madeira) amounted in 1897 to £239,531, and the exports to £272,222. The chief product of the islands is fruit, 32,000 boxes of oranges being exported in 1898. An exhibition and fair was opened at St. Michael's on July 1, 1901, in honor of the first visit of the king and queen of Portugal to the islands. During 1901 a new cable was laid between Horta, on the island of Fayal, and Waterville, Ireland.

BABCOCK, MALTBIE DAVENPORT, American clergyman, died at Naples, Italy, May 18, 1901. He was born at Syracuse, N. Y., in 1858, graduated from Syracuse University in 1879, and from the Auburn (N. Y.) Theological Seminary in 1882. Dr. Babcock went from his first pastoral charge at Lockport, N. Y., in 1887 to the Brown Memorial Church of Baltimore, Md., remaining there until he was called to the Brick Presbyterian Church in New York City in 1900, to succeed the Rev. Dr. Henry Van Dyke. As a magnetic pulpit orator and an energetic director of his church's affairs, he became widely and favorably known. He was also the author of a number of religious poems and hymns. While on a journey to the Holy Land in company with other American clergymen he fell ill, and during the delirium of fever took his own life in a Naples hospital.

BAGDAD RAILWAY. See **TURKEY** (paragraphs on History).

BAHAMAS, a British colony comprising 20 inhabited and many uninhabited islands off the southeastern coast of Florida. The area is about 5,450 square miles and the estimated population in 1901 about 55,500, of whom four-fifths are negroes. The seat of government is Nassau, on New Providence, the most important island. The colony is administered by a governor, Sir Gilbert Thomas Carter since 1897, who is assisted by an executive council, a legislative council, and a representative assembly.

In 1900 the revenue, which is derived mainly from the customs, amounted to £78,661, against £76,697 in 1899; and the expenditure was £82,837, against £68,749 in the preceding year. The increased expenditure was due to the establishment of a sinking fund for reducing the public debt; this debt at the end of 1900 amounted to £112,226.

Imports and exports in 1899 amounted to £329,196 and £169,148, respectively; in 1900, imports, £325,269, and exports, £172,317. The imports consist largely of British cotton goods and American food stuffs; and the leading exports are sponges, fruit, and sisal fibre. Practically all of the fruit is shipped to Baltimore, and the sponge and fibre to Great Britain. During the last five years trade has greatly increased, the imports in 1896 having amounted to only £194,474, and the exports to £138,972. In his annual report the colonial secretary said that the social condition of the people was improving, and that although they had little accumulated savings and no capital for investment but their labor, they were far removed from the desperate poverty of many of the Caribbee Islands.

BALDWIN, EVELYN BRIGGS, American Arctic explorer, member of the Peary North Greenland expedition of 1893-94 and of the Wellman expedition to Franz Josef Land of 1898-99, headed a separate expedition to the North Pole, leaving New York City early in 1901. Upon the return of the *Frithjof*, one of his ships, to Hammerfest, Norway, in August, Mr. Baldwin was reported to have been left at Cape Ziegler (80° 24' N.), preparing to advance immediately. He was born at Springfield, Mo., July 22, 1862, and was educated in Illinois. After several years of experience as a farmer, teacher, and school superintendent, he became an observer in the United States Weather Bureau in 1892. As inspector-at-large in the United States Signal Service, he secured the cooperation of Mr. William Ziegler, of New York City, who fitted out the present expedition.

BALDWIN, JAMES MARK, the American psychologist, whose *Dictionary of Philosophy and Psychology* was issued in 1901, was born at Columbia, S. C., January 12, 1861, and graduated at Princeton University in 1884. Oxford University con-

ferred the degree of Sc.D. upon him in 1900, the first honorary degree in science ever given by that university. After teaching at Princeton (1886), at Lake Forest University (1887-89), at Toronto University (1889-93), he returned to Princeton in 1893 as professor of psychology. At Geneva, in 1896, he was president of the International Congress of Criminal Anthropology, and in 1897-98 he was president of the American Psychological Association. He is a member of many societies, and is the author of a *Handbook of Psychology* (1890), *Elements of Psychology* (1893), *Mental Development in the Child and the Race* (1896), and the *Story of the Mind* (1898).

BALIZE. See BRITISH HONDURAS.

BALKAN PENINSULA is that part of southeastern Europe lying between the Black and ~~Ægean~~ ^{Ægean} seas on the east and the Adriatic and Ionian on the west. The Danube River and its tributaries, the Save and Una, may be regarded as its northern boundary. What are usually termed the "Balkan States" are Servia, Bosnia and Herzegovina, Montenegro, Bulgaria, and Roumania (*q. v.*), while Turkey and Greece (*q. v.*) also lie within the peninsula.

The chronic condition of trouble and rumors of trouble in the Balkans continued in 1901. One of the important developments of the year, outside Turkey proper, was the apparent growth of Russian influence at the expense of Austrian. In Roumania, which is probably the strongest of the former Ottoman states to the north of Turkey proper, and which politically, though not geographically, is a constituent part of the Balkan peninsula, Austrian influence remained paramount. In Servia, however, among other things, should be noted the alleged military *rapprochement* with Russia; in Bulgaria, a Russian loan and the official visit of the Grand Duke Alexander Mikhailovitch; while Montenegro is steadfastly pro-Russian. Moreover certain Austrian journals published exposures of alleged Russian intrigues in Servia, Bulgaria, Roumania, and Macedonia, and the *Pester Lloyd*, a semi-official Hungarian organ, accused the Bulgarian government of permitting Russian war vessels to navigate the lower Danube outside of Russian territory, thus violating the treaty of Paris. In a report on foreign affairs, May 22, 1901, Count Goluchowski, the Austro-Hungarian foreign minister, referred to the Balkan situation as critical, and intimated that Austria-Hungary could not permit any attempt at changing the *status quo* in the peninsula.

BALLOONS. See AERIAL NAVIGATION.

BALUCHISTAN, a country of southern central Asia, bounded by Afghanistan, India, the Arabian Sea and Persia. It has an area estimated at 130,000 square miles and a tribal population estimated at 500,000. The Baluchis, a nomad race, are most widely spread; the dominant race are the Brahurs of the eastern plateau. The territory comprises four administrative parts, viz.: (1) independent Baluchistan, (2) Quetta and the Bolan, administered by the British government under a permanent lease from the Khan of Khelat, (3) British Baluchistan, and (4) the tribal territories of Pathan and Baluch. Quetta is the largest town; Khelat the capital. Independent Baluchistan is governed by Mir Mahmud, Khan of Khelat, who is the head of a confederacy of tribal chiefs, and whose powers are loosely defined. In important matters he is amenable to the British agent of the governor-general, who decides tribal disputes, and holds the balance of power. The Khan receives from the Indian government an annual subsidy of 100,000 rupees (rupee equals 30.4 cents), besides 30,000 rupees in lieu of the transit tolls on merchandise in the Bolan pass, and a quit rent of 25,000 rupees (recently increased), in lieu of the revenues of Quetta and Nushki. There is no regular standing army, except a force of about 1,200 men maintained by the Khan, who would be able to muster for war a force of about 10,000, but with only uncertain armament. Much of the country is mountainous and adapted to grazing, supporting great herds of sheep and some camels. The rainfall is uncertain. Most of the products found in India may be raised. Coal has been mined successfully along the line of railway from Sind to Pishin; lead, copper, and petroleum have been found. The exports include wool, hides, modder, dried fruits, bdellium, tobacco, and dates. The principal travel of the country is still accomplished by the use of camels over the caravan routes. Quetta is connected by rail with the Indian railway system, enabling the government to control this strategic centre. A commercial route across the country to Persia, beginning at Quetta, was established some years ago, over which a great part of the trade of India with Persia and Russian central Asia is carried on. A British consulate has been opened at Seistan, in Persia, where Russia seems also intending to establish a consulate, in competition for the commercial supremacy of southern Persia. In furthering British-Indian trade with this region, an agreement has been made with the Shah for a land telegraph line to connect Jask, on the Persian coast, with Kershan, Persia; and by a line linking Nushki with this new line at Ferman, the trade of the Quetta and Nushki commercial route to Berfond and Meshed, Persia, will be greatly facilitated. The trade with British India in 1898 (estimated) was: ex-

ports, 1,737,890 rupees; imports, 826,650 rupees; 1900, exports, 1,455,310 rupees; imports, 787,350 rupees. The present British agent at Quetta is Mr. H. S. Barnes. There are no international relations except with the Indian government.

BANCROFT, CECIL FRANKLIN PATCH, American educator, died at Andover, Mass., October 4, 1901. He was born at New Ipswich, N. H., November 25, 1839, graduated at Dartmouth College in 1860, and from Andover Theological Seminary in 1867. For a time he was a student at the University of Halle, Germany, and at various times received the degrees of Ph.D. (from New York University), LL.D. (from Yale), and L.H.D. (from Williams College). From 1860 to 1873 he filled various headmasterships, and in the latter year was called to take charge of Phillips Academy at Andover, Mass., where he remained for twenty-eight years. During this long service, Mr. Bancroft had under his care more than 6,000 students, and he had the distinction of having sent more boys to college and scientific schools than any other American educator. He held a high place in the esteem of educators all over the country.

BANKRUPTCY. The classification of business failures for 1900 and 1901 according to Dun's *Review* is given on the two pages following.

The increase in the number of insolvencies is due to the fact that the higher earnings of salaried employees and the larger returns from small investments, many of which, owing to insufficient capital or experience, went to the wall. The high solvency of 1901 is shown by the decrease of \$42,000,000 in the liabilities of failed concerns. This is the more remarkable in view of the heavy losses caused by the panic of May 9 and by the drought throughout the corn belt. The greatest increase in the number of insolvencies was in the South, a circumstance due to the failure of the cotton crop in many places and the lower price of that staple.

BANKS—BANKING. *Banking Reserves and Expansion.*—During the past two years the increasing demand for money in all parts of the country has aroused new interest in propositions looking to a safe and adequate expansion of the money supply. The conviction has also grown that this currency can be safely furnished only by the banks. At the same time, bankers have been generally ready to admit that the present banking system of the United States is faulty in the extreme, in that it is composed of a vast number of independent banks without central control, and that this situation not only involves a waste of energy in maintaining a large number of idle cash reserves, but is a source of danger in time of panic. The last report of Secretary of the Treasury Gage discussed this situation at length and presents some recommendations for change. The secretary criticised our present banking system as follows: "Admirable in many respects, experience shows that our banking system is devised for fair weather, not for storms. The individual banks stand isolated and apart, separated units, with no tie of mutuality between them. There is no obligation of duty from the strong to the weak or exposed, nor any method of legal association for common protection and defense in periods of adversity or depression." The consequence of this condition of isolation was shown to be a wholesale calling of loans at every period of stringency. The daily creations of the necessary medium of exchange, bank credits, cease or become entirely inadequate to commercial requirements. "The daily natural liquidation of credits continues, resulting in contraction. Business men carrying goods and securities by the aid of bank credit are obliged to sell with little regard to cost. Contemplated enterprises are abandoned, orders for future delivery of goods are rescinded, and as these successive steps mark the downward movement, the banker becomes the more reluctant to perform his important function of loaning his credit for commercial and industrial uses. What should be, under these circumstances, an orderly, conservative movement to more secure conditions becomes an unreasonable, panic, in which at last the entire business public is hopelessly involved. The so-called panic of 1893 is a marked example. Within a period of less than twelve months, bank credits, deposits, were contracted to a total of more than 400 millions, while the actual cash holdings by the banks were increased by nearly 50 millions." The remedy for this condition was shown to be a reorganization of the banking system in such a way as to centralize and unite the reserves of all the banks, thus bringing the aid of the stronger institutions to the support of the weak, and rendering unnecessary the heavy calling of loans, which, under present arrangements, so greatly aggravates the severity of every financial crisis. Mr. Gage also suggested a plan by which a federation might be effected. His method is the application of the principle of federation "under which the banks, as individual units, preserving their independence of action in local relationship, may yet be united in a great central institution. Formed by some certain percentage of capital contributed by the banks themselves, and its management created by the suffrage of all, it would represent the interests of the whole country. With limited powers of control over its membership in the interest of common safety, confined in its dealings to the banks and the government, it could

become the worthy object of a perfect public confidence. By the concentration of unemployed reserves from sections where such reserves are not needed, it could redistribute them in part as loans where most needed, and thus bind together for a common strength and protection the loose, unrelated units, in whose separation and isolation the greatest weakness of our banking system is now to be found." These suggestions for banking reform concern also the disposition of the treasury surplus, a matter which is arousing the deepest concern among business men at the present time. The present estimate of receipts and disbursements indicate a total surplus of \$100,000,000 for the fiscal year ending June 30, 1902. (See UNITED STATES, paragraph Revenue and Expenditure.) This is a larger working balance than is carried by any treasury or financial institution in the world; it is not demanded by the requirements of fiscal security, and in times of active business locks up in the treasury a supply of currency which is badly needed in the money market. The *Commercial and Financial Chronicle* recently remarked of this condition: "Such a surplus forebodes an active contest between the money market and the sub-treasury." The remedy offered by Mr. Gage for the imperfections of the banking system applies also to the difficulty presented by the surplus. He proposes, in effect, that the treasury should deposit its surplus cash in a central institution, and that the reserves of the banks should be deposited in the same place. This central reserve bank would thus bear the same relation to the American money market that the Bank of England sustains to the banks of the United Kingdom; it would be the depository of all the unused cash of the country and would be able, because of its immense reserve, to loan freely in every time of monetary strain. Secretary Gage further elaborated his ideas on this subject at a dinner of New York bankers, and they have met with much favorable comment in many quarters. The same idea of a central reserve bank was put forward by Mr. H. B. Stickney, president of the Chicago Great Western Railway, in speeches delivered before the Bankers' Convention on October 5, 1901, at Milwaukee, and before the Chicago Bankers' Association on December 13. These addresses were widely quoted and discussed. Mr. Stickney's proposition was as follows: Let the government get out of the banking business and thus throw the burden of maintaining the gold reserve upon the banks. "The impossibility of more than 9,000 banks protecting the gold reserve against exportation would of itself necessitate a central reserve bank, to which would be delegated the sole responsibility of protecting the reserve." Mr. Stickney also answered the objection that such a bank would become a dangerous monopoly. "The necessity of keeping 45 per cent. of reserve would render it incapable of competing, except in large transactions, with banks which carry no more than 5 to 8 per cent. of reserve. It is my conviction that if the restrictions of the American banking laws were repealed and banking made free, there would be developed in the United States a banking system substantially on the lines of the Scotch-English system. In process of time, one of the systems of branch banks would demonstrate its fitness, and solely by reason of its superior fitness, not by force of legislation, it would be selected by the other banks as the central reserve bank."

Currency Questions.—Secretary Gage, in his annual report, also dealt with the subject of the currency. He pointed out that the paper currency of the United States consisted of \$346,000,000 of government notes and a little more than \$360,000,000 of national-bank notes. The amount of this paper currency is strictly limited. The government notes cannot be increased in amount, and, while in theory the only limit to the expansion of the national-bank currency is the amount of government bonds in the market, as a matter of fact, the price of government bonds is now so high as to present to a bank buying bonds and issuing notes in a locality where the rate of interest is 6 per cent., a profit of one-half of one per cent. At its present rate of growth, our population in 1950 will probably amount to 190,000,000, and to meet the needs of this rapidly growing population a steady expansion of the paper money supply is necessary. Our present system of currency is also defective, on account of its inflexibility and consequent lack of adaptation to the changing requirements of trade. It is impossible that the government should further increase its demand obligations which have always been a menace to its financial stability. Indeed, in the opinion of the secretary, prudence demands that the amount of these demand obligations should be reduced. The proper agencies for the expansion of the circulating medium are the banks, by means of a credit currency. Already 90 per cent. of the business of the United States is transacted by the use of bank credits. "It is no strain on language, nor does it do violence to truth, to say that through the loaning operation of the banks, the medium of exchange is expanded and contracted by millions every day. Now there is no difference whatever in principle between the bank's obligation to pay, expressed by a credit on their books, and an obligation to pay expressed in the form of a note payable to bearer, which may be transferred from hand to hand. If it be of public advantage that bank credit be made available through the machinery of checks or transfer orders to those who can make the

more convenient use of the credit in that form, there can be no primary reason why to those who find their requirements better served by the bank's credit in the form of bank notes, they should not be issued. It would appear right and reasonable, then, that the governing power should surround the bank credit utilized in the form of bank notes, with such necessary guards and guarantees as may be required to make them safe, free from risk of loss, in the hands of those who have little choice as to whether or not they will receive them in exchange for their wares or the payment of wages. Having done this, the government's responsibility may rightfully be said to terminate." In order safely to attain the desired end of an adequate and elastic currency, and at the same time relieve the government from a portion of its demand obligations, the secretary suggested the following amendments to the existing law: (1) Any national banking association which shall deposit with the United States treasurer 30 per cent. of its capital in United States bonds and 20 per cent. in United States notes as security, and which shall pay annually one-fourth of one per cent. of its capital stock into a 'guaranty fund' for the redemption of the notes of failed banks, shall be entitled to issue its circulating notes to an amount equal in value to its paid-in and unimpaired capital. When such a bank becomes insolvent, the treasurer shall sell the bonds on deposit, and transfer the proceeds, together with an amount of United States notes equal to the amount deposited as security, to a special fund for the redemption of the notes of the failed banks, and he shall make up the cash equivalent of its outstanding notes by adding to these funds, from the 'guaranty fund.' The amount taken from the 'guaranty fund' shall be assessed against the receiver of the bank in question and when recovered shall be restored to that fund. It was estimated that under these amendments to the existing laws, the total circulating medium would be increased in three years by more than 300 millions, and also that by impounding the greenbacks, the burden of redeeming them would be taken from the government. At the end of three years, the demand obligations would be reduced to 146 millions, as compared with 150 millions of gold reserve. The estimated profit on the issue of notes under these circumstances in a locality where the rate of interest is 6 per cent., and where the whole amount of notes authorized is issued would be 2.35 per cent. as compared with one-half of one per cent. under the present system. In answer to the objection that the guaranty fund proposed would be too small for safety, the secretary shows that had this system been in operation for the past thirty-six years, among the national banks, the note holders of all insolvent banks would have been fully protected, and there would have remained to the credit of the guaranty fund \$27,421,959.

Resources of Banks in the United States.—The statistics for all banks of the United States, from reports made to the comptroller of the currency on or about June 30, 1901, show aggregate resources of \$12,329,560,255, a gain over the preceding year of \$2,460,000,000. The population of the United States on June 1, 1901, as estimated by the government actuary, was 77,647,000, making the average per capita resources of all banks, \$158.79; this average per capita being made up by the several classes of banks as follows: national, \$73.10; State, \$27.47; savings, \$35.50; private, \$1.92; trust and loan, \$20.80. The largest per capita resources of all banks was in the New England States, the per capita there being \$351.68. The Eastern States followed with a per capita of \$338.32; and then came in order, the Pacific States, per capita, \$179.74; the Middle States, per capita, \$113.13; the Western States, per capita, \$82.01; and the Southern States, per capita, \$34.30. The Southern States, possess, according to the number of inhabitants, less than half the banking resources of any other section of the country, and between one-fourth and one-fifth of the average banking resources of the country. At the same time it is significant, as indicating the relative strength and stability, or the lack of these qualities in Southern banks, that while the New England States have no private banks, and State banks with per capita resources of only \$2.58 out of total per capita resources of \$351.68, the Southern States out of total per capita resources of \$34.30, have private and State banks with per capita resources of \$21.14.

Acting with the Internal Revenue Bureau, the comptroller of the currency in 1899 made a special investigation relative to the number of depositors and borrowers and the amount of deposits and loans of all banks in the United States. The estimated capital of the 12,804 banks, of which information was obtained, was shown to be approximately \$1,150,000,000, deposits \$7,513,954,361, and loans and discounts \$5,751,467,610. For the fiscal year ending June 30, 1901 (including returns from national banks of date July 15, 1901), there are shown statistics relating to the principal items of resources and liabilities of 12,972 banks and bankers, with capital of \$1,138,042,134; surplus and undivided profits of \$693,465,095 and \$270,855,253, respectively; deposits, \$8,619,285,110, and loans and discounts, \$6,491,630,743. In the New England States there are shown to be in operation, by these returns, 1,103 banks, with deposits aggregating \$1,511,209,112, and loans of \$1,112,156,141. In the Eastern States the returns from 1,976 banks show deposits aggregating \$4,156,162,050

For further details regarding each class of banks in the United States, as compiled by states, see articles NATIONAL BANKS, PRIVATE BANKS, STATE BANKS, SAVINGS BANKS, and TRUST AND LOAN COMPANIES.

and loans of \$2,831,479,771. The excess of deposits over loans in this geographical division and in the New England States is due to large investments in stocks, bonds, and other securities by savings banks. The deposits in banks in the Southern States amount to \$501,905,118 and loans to \$493,188,951; in the Middle States deposits aggregate \$1,720,073,957 and loans \$1,520,994,394; in the Western States the deposits in the banks are shown to be \$294,383,819 and the loans \$229,665,067; in the Pacific States deposits aggregate \$412,534,452 and loans \$200,198,156. Statistics were obtained on the same lines from 1 national, 3 other incorporated, and 2 private banks in Hawaii; 3 incorporated banks in Porto Rico, and 7 incorporated banks, including branches, in the Philippine Islands, making an aggregate of 16 institutions in these new Territorial possessions. The aggregate capital reported is \$4,313,978; surplus and undivided profits, \$1,627,250; deposits, \$23,018,602; and loans, \$13,908,262.

The table on the preceding page, compiled from figures published by the comptroller of the currency, shows by States the per capita resources of each class of banks and of all banks in the United States on or about June 30, 1901, and shows also the total resources of all banks in 1901, and the total resources, by millions, of all banks in the United States on or about June 30, 1900.

For further details regarding each class of banks in the United States, as compiled by States, see articles, NATIONAL BANKS, PRIVATE BANKS, STATE BANKS, SAVINGS BANKS, and TRUST AND LOAN COMPANIES.

National Banking Reserves and Legislation Recommended.—Particular interest always attaches to the percentage of reserve held to secure deposits. Banks in New York, Chicago, and St. Louis, which are required to hold a reserve equal to 25 per cent. of their deposit liabilities, held 26.16 per cent. Banks in twenty-nine reserve cities with the same requirement of reserve held 29.36 per cent., and banks outside of reserve cities, with a legal requirement of 15 per cent., held 27.56 per cent. of reserve. On its face, this return would seem to indicate great conservatism of management in regard to the security of deposits. The national bank law, however, allows reserve city banks to deposit 50 per cent. of their legal reserve with agents in the central reserve cities, and country banks to deposit 60 per cent. of their legal reserve with reserve agents in the thirty-two reserve cities. The figures of reserve held, therefore, contain a large proportion of claims against other banks. This is shown by the fact that taking the national banks as a whole the cash reserves held amounted to only 7.9 per cent. of the deposits. This is a poorer showing than the one made by State and private banks, which held on the same date a cash reserve equal to 9.4 per cent. of these deposits.

Comptroller Ridgely makes few recommendations in regard to legislation. He indorses the suggestion of his predecessor, Mr. Dawes, that the provisions of the law prohibiting the use of their power by national bank officers for personal purposes, should be made more stringent, and he recommends a modification of the provision of the national bank act, prohibiting national banks from loaning more than an amount equal to one-tenth of their capital stock to any one person. Mr. Ridgely takes strong ground in favor of a modification of the present regulations permitting the deposit of government funds in banks. "An examination of the records of all the national banks during the first thirty-six years of their operations shows that, if the surplus money in the treasury had been deposited in the banks of the clearing-house cities and the government had been given a first lien on the assets of these receiving banks, there would have been not one dollar of loss to the United States government; that is, the money would have been just as safe as it has been locked up in the vaults of the Treasury, and being thus kept in the banks, it might have formed the basis for loans on the part of the banks which would have been at times of great service."

Foreign Banks of Issue.—The condition of the principal foreign banks of issue on April 1, 1901, as reported by the *Bulletin de Statistique*, is as follows, in millions of francs (the franc equals 19.3 cents):

BANKS.	GOLD.	SILVER	TOTAL SPECIE.	CIRCULATION.	DEPOSITS, ETC.	MIN. RATE OF DISCOUNT.
Imperial Bank of Germany....			1,129.8	1,718.7	756.6	3½

BANTING. See OBESITY.

BAPTISTS are comprised in thirteen church organizations, agreeing on the cardinal points of baptism, though differing on other points; the three great bodies

of Regular Baptists (North, South, and Colored), however, are distinct, not in ecclesiastical differences, but in administration, each maintaining separate activities. The denomination, with over four and one-half millions of members, ranks, in the United States, next to the Roman Catholic and Methodist churches. According to the latest statistics published by Dr. H. K. Carroll, in the *Christian Advocate*, the strength of the various Baptist bodies is as follows: Regular Baptists (North), 7,537 ministers, 9,305 churches, and 1,005,613 communicants; Regular Baptists (South), 12,599 ministers, 19,799 churches, and 1,674,108 communicants; Regular Baptists (Colored), 9,916 ministers, 15,195 churches, and 1,590,802 communicants; Six-principle Baptists, 8 ministers, 12 churches, and 828 communicants; Seventh-day Baptists, 122 ministers, 116 churches, and 10,104 communicants; Free-will Baptists, 1,436 ministers, 1,522 churches, and 86,535 communicants; Original Free-will Baptists, 120 ministers, 167 churches, and 12,000 communicants; General Baptists, 484 ministers, 423 churches, and 24,775 communicants; Separate Baptists, 113 ministers, 103 churches, and 6,479 communicants; United Baptists, 25 ministers, 204 churches, and 13,209 communicants; Baptist Church of Christ, 80 ministers, 152 churches, and 8,254 communicants; Primitive Baptists, 2,130 ministers, 3,530 churches, and 126,000 communicants; Old-Two-Seed-in-the-Spirit Predestinarian Baptists, 300 ministers, 473 churches, and 12,851 communicants. The figures for the three Regular bodies are estimates (Dr. Carroll notes), as the returns for 1901 were not ready.

National anniversaries of the Northern Baptists, at Springfield, Mass., May 20-28, were marked by features commemorative of the first meeting of the century. A report from the joint committee appointed in 1900 in the interests of a union of the agencies of some of the various societies and consolidation of their work was heard, and led to the reference of the problem to future conferences. From the various activities of the church, home and foreign missions, including the work of the women's auxiliaries, the educational and publishing interests, statements of progress were received. About \$500,000 is expended on home missions among 20 nationalities of this country; a notable work in this department is that of the chapel-car service, an institution of 10 years' standing, and now representing an investment of \$100,000, which has been effective in organizing a number of churches and Sunday-schools, and also in philanthropic work. There are now six of these cars, each containing a chapel and parsonage, which are hauled and kept in repair by the railroad companies, though built and owned by the church. The publication society, under the auspices of which this last branch is conducted, reports an income of \$887,472. The American Baptist Missionary Society received nearly one million dollars for its work (including over \$400,000 from native churches) which embraces foreign fields in Burma, Assam, Southern India, West Africa, China, Japan, and the Philippines, in which fields there are 472 missionaries and 3,482 native helpers, 927 churches with 105,212 members, and 36,335 scholars in mission schools; and domestic missions in Alaska, Porto Rico, Cuba, Mexico, and among the Indians and negroes, in which are engaged 1,199 missionaries and teachers. There are also missions on the continent of Europe, and a large number of self-supporting churches in Asia and Africa, the missionary work of the church being directed toward establishing the independence of the churches that are organized. At the forty-sixth session of the Southern Baptist convention, in New Orleans, some dissatisfaction was expressed with the amount of offerings, as not proportionate to the members and wealth of the denomination; the discussion led to a consideration of the report of the committee on cooperation, one of the noteworthy features of the meeting. The Southern Baptist Missionary Conference reports 102 missionaries, 41 ordained and 130 unordained native helpers, and 127 churches in the several fields, which include China, Japan, Africa, Italy, Mexico, and Brazil. The twenty-first annual session of the National Baptist convention, held in Cincinnati, was noteworthy as one of the most successful in the history of the organization. Much interest was shown in the fact that during the past year \$129,000 had been realized for education. *The Ethics of Gambling* was a prominent topic at the nineteenth annual Baptist conference for the discussion of current questions, held in November, 1901, in New York City. A notable publication of the year 1901, in connection with the Baptist denomination, has been *A Century of Baptist Achievement*, edited by A. H. Newman, D.D., LL.D., recently elected president of Baylor University, Waco, Tex.

BAPTIST YOUNG PEOPLE'S UNION OF AMERICA, founded in 1891, is a denominational organization of the various young people's societies in the Baptist churches, the object of which is to stimulate activity along spiritual and missionary lines and to promote biblical and denominational education. A prominent feature of its methods is the work of the Christian Culture courses. The eleventh international convention, in Chicago, Ill., July 25-28, 1901, was marked by spirited addresses on current topics of interest; the meeting of 1902 will convene July 10-13, in Provi-

dence, R. I. The *Baptist Union* represents the interests of the society. President, John H. Chapman; headquarters, 324 Dearborn Street, Chicago.

BAR ASSOCIATION, AMERICAN, organized in 1878, is composed of the leading lawyers in the United States who meet annually to discuss matters of importance to the profession and to the community at large. Each State is represented by one vice-president. Membership, 1,700. President, V. M. Rose, Little Rock, Ark.; treasurer, Francis Rawle, Philadelphia, Pa.; secretary, John Hinkley, 215 North Charles Street, Baltimore, Md.

BARATIERI, General **ORESTE**, Italian soldier, died at Sterzing, in the Austrian Tyrol, August 8, 1901. He was born at Cordino, November 13, 1841, and saw service first with Garibaldi in the expedition to Sicily in 1860. In 1866 he was with Garibaldi again against the Austrians, and at the conclusion of that war joined the regular army and went to the Red Sea as colonel of Bersaglieri in 1888. He acted as governor of Erythrea, Italian East Africa, from 1892 to 1896, leading several successful expeditions against the Abyssinians until, just before he was recalled, he met with the disastrous defeat at Adowa, in March, 1896, at the hands of King Menelek, the Italian loss being 10,000 killed. For this he was court-martialed, on the charge of attacking an impregnable position under conditions rendering defeat inevitable, but was acquitted.

BARBADOS, a West Indian island constituting a British colony, has an area of 166 square miles and its estimated population in 1900 was 195,000. The colony is administered by a governor, Sir Frederic M. Hodgson, in 1901; legislation is effected by an appointed council and an elected assembly. The revenue and expenditure in 1899 were £216,022 and £207,883 respectively; in 1900 the revenue amounted to £185,475, of which over 75 per cent. was derived from customs and excises, while the expenditure was £182,866. The public debt, which has been incurred for the construction of public works, chiefly water supply, amounted to £416,850 at the end of 1900.

In 1899 the imports and exports amounted to £998,006 and £845,590 respectively; in 1900 the imports were valued at £1,045,251, of which nearly half came from Great Britain, and exports amounted to £919,011, of which £694,038 represented the produce of the colony, mainly sugar and its products. The sugar export, valued at £485,736 in 1900, goes mainly to the United States. In his annual report in 1901 the colonial secretary said: "The colony has thus far paid its way well, and the administration has every reason to be satisfied with the results of the year; . . . but it must be remembered that this result has only been obtained by the imposition during seven and a half months of 1900 of a tariff which doubtless pressed somewhat hardly on trade."

In October, 1901, a landslip extending over 500 acres occurred in the Boscobel district; many houses were wrecked, 85 being swept into the sea, roads and landmarks were effaced, and 400 people left homeless.

BARBIER, **PAUL JULES**, French librettist and playwright, died in Paris, January 17, 1901. He was born March 8, 1825. Besides writing the libretto for Gounod's *Faust* (1859), which is his best-known work, M. Barbier produced libretti for operas by Ambroise Thomas, Massenet, Meyerbeer, and others, and many original comedies. His principal works, aside from *Faust*, are libretti for Gounod's *Philemon et Baucis* (1860), *Roméo et Juliette* (1867), Thomas' *Mignon* (1866), *Hamlet* (1868), and *Françoise di Rimini* (1882), and the dramatization of *Néron* (1885), an original tragic poem, to music of Rubinstein. In collaboration with M. Carré he wrote numerous libretti for the Opera Comique, the most successful being the book for Massé's *Paul et Virginie* (1876). M. Barbier also published a volume of patriotic verse and two volumes of poems. He was an officer of the Legion of Honor from 1865.

BARLEY. As reported by the United States Department of Agriculture, the barley crop by countries in 1900 was as follows:

	Bushels.		Bushels.
Russia	236,981,000	Canada	22,975,000
Germany	137,889,000	Denmark	21,000,000
Austria-Hungary	118,750,000	Sweden	14,786,000
Great Britain and Ireland....	70,700,000	Mexico	10,000,000
United States	58,926,000	Italy	7,000,000
Spain	55,000,000	Australasia	3,730,000
Japan	44,000,000	Netherlands	3,500,000
France	43,612,000	Belgium	3,000,000
Algeria, Tunis, and Cape Colony	41,800,000	Total	919,224,000

The imports of barley into the United States in 1900 were 189,612 bushels (valued at \$91,040), of which nearly the whole were exported from Canada. In 1901 the imports amounted to 171,004 bushels (valued at \$84,073), of which 170,512 bushels (valued at \$83,705) came from Canada. In 1897 the imports were 1,271,787 bushels (valued at \$394,749). The exports in 1900 were 23,661,662 bushels (valued at \$11,216,694) and in 1897, 20,030,301 bushels (valued at \$7,646,384). The exports in 1901 amounted to 6,293,207 bushels (valued at \$2,883,565); the principal part was sent to Great Britain (4,880,573 bushels, valued at \$2,180,524); Belgium took 436,321 bushels (valued at \$202,401). The other countries receiving important shipments of barley are Germany, the Netherlands, and Hawaii. In the United States the acreage in 1900 was 2,894,282 acres, the yield 20.4 bushels an acre, the farm price 40.8 cents a bushel, and the farm value of the crop \$24,075,276. The results of 10 years' experiments in sowing barley at different dates at the Canadian Experimental Farms have uniformly resulted in favor of the sowing made about one week after the ground is in such condition that sowing is practicable. Barley has been successfully matured during the past three years at the agricultural experiment stations at Sitka and Kenai (in Cook Inlet), Alaska, and also in 1901 at Rampart in the Yukon Valley.

At the Ontario Agricultural College and Experimental Farm, Laritz reports that Manchury barley has been compared with the widely cultivated common 6-rowed barley for 12 years, and the results show an average yield of 66.8 bushels of grain and 1.6 tons of straw an acre for the Manchury and 57.6 bushels of grain and 1.6 tons of straw for the common 6-rowed. The average results for several years show that the best 2-rowed barley yielded about 14 bushels an acre less than the best 6-rowed variety. The Manchury variety, which was introduced into the United States from Asia by the Wisconsin Experiment Station, is now grown over a wide range of territory in this country and has been of great financial benefit to the farmers producing this crop. Von Seelhorst and N. Georgs have reported the results of an important pot experiment on the influence of different fertilizers and the water content of the soil upon the form and composition of the barley plant. They found that supplying the element or elements of plant food which are present in the soil in only minimum quantities, favors the development of the roots as well as of the parts of the plant above ground, and that the increase of organic substance in the soil due to the development of the roots has a beneficial effect on the succeeding crop. It was noticed that the low-water content of the soil induced a greater development of the root system, and attention is called to the fact that an increase in root development means a withdrawal of plant food from the other parts of the plant. The application of nitrogenous fertilizers when only a small amount of nitrogen was present in the soil, together with a high soil humidity, favorably influenced the stooling of the plant. An increase in the humidity of the soil without the application of nitrogen increased the strength of the stalk, shortened the heads and reduced their weight, but when nitrogen was used at the same time that the humidity of the soil was increased stronger stalks and longer and heavier heads were produced. Examination of the grain led to the conclusion that on dry soils nitrogenous fertilizers tend to increase the nitrogen content of the grain, but that there is less danger of producing barley too rich in nitrogen for brewing purposes by the use of nitrogen in fertilizers when the soil is moist.

An examination of the weight of the grain of barley, oats, rye, and wheat as related to the climate of the region in which the crop was grown was made by Jensen in Denmark on the basis of samples received from the United States and twelve European countries. He found that the grain weight was greater in regions with a coast or insular climate and also that it increased with increasing temperature.

BARNARD COLLEGE, New York, organized 1889, a woman's college, being an integral part of Columbia University (*q.v.*).

BAR OF THE CITY OF NEW YORK, THE ASSOCIATION OF THE, organized in 1869 and incorporated 1871, had, at the last report of the executive committee, 1,663 members. The association has had, during its existence, the following presidents: William M. Evarts, 1870-79; Stephen P. Nash, 1880-81; Francis N. Bangs, 1882-83; James C. Carter, 1884-85; William Allen Butler, 1886-87; Joseph H. Choate, 1888-89; Frederick R. Coudert, 1890-91; Wheeler H. Peckham, 1892-94; Joseph Laroque, 1895-96; James C. Carter, 1897-99; John E. Parsons, 1900-01. The association owns and occupies a commodious building at No. 42 West Forty-fourth Street, New York City, and has a valuable law library of over 53,000 volumes. The admission fee is \$100, and the annual dues for resident members \$50 and for members non-residents but having offices in the city \$25. A member who does not reside and has no office in New York is exempt from the payment of annual dues. President, John E. Parsons; recording secretary, S. R. Brownell; treasurer, S. Sidney Smith.

BARON DE HIRSCH FUND, a trust fund created in 1889 by Baron Maurice de Hirsch for the benefit of Jewish Russian-Roumanian emigrants to America;

capital, \$2,500,000; annual income, \$100,000. The main scope of the work is: To provide for the reception of emigrants and assist them in getting a start in life; to teach habits of thrift and self-support in this country; provide day and night schools for children and adults; furnish mechanics with tools and teach them how to use them; make advances by way of loans and furnish transportation to centres of employment. The fund also maintains the Baron de Hirsch English day school in the Educational Alliance building, 193 East Broadway, N. Y., an evening English school at the same address for Russian men and women who work during the day, and the Baron de Hirsch trade school at East Sixty-fourth Street, where young men are taught useful mechanical trades—machine work, plumbing, carpentry, electrical construction, sign and house painting, etc.—under E. G. Yalden, superintendent. The Jewish Colonization Society is in active cooperation with the fund. Attendance at the English schools, both day and night, is about 650. President, Myer S. Isaacs; treasurer, Emanuel Lehman; general agent, A. S. Solomans; headquarters, 45 Broadway, New York City.

BARTON, EDMUND, Australian statesman, was appointed premier of the new Australian commonwealth and minister for foreign affairs in 1901. He was born at Glebe, Sydney, New South Wales, January 18, 1849, and was educated at the Sydney grammar school and university, being called to the bar of that city in 1871. He was first elected to the legislative assembly in 1879, and from 1883 to 1887 served as speaker, afterwards entering the legislative council. In 1889 he was attorney-general, being reelected in 1891, and was a member of the federal convention which met at Sydney. From that time forward he was one of the most active supporters of the federation scheme, going as the senior representative to the convention of 1897, and taking the leading part in the proceedings until the Federal Constitution bill was adopted. For a time he was the leader of the opposition in the New South Wales parliament, but resigned that post to devote himself entirely to the cause of federation. In 1900 he went as a delegate to England to support the constitution bill, where he attracted notice by his able advocacy of the cause. Upon the failure of Sir William Lyne, who had been called upon by the new governor, Lord Houghton (*q.v.*), to form a ministry, Mr. Barton was selected to create a cabinet. He is a protectionist in politics, and an ardent supporter of nationalism. See **AUSTRALIA**, **COMMONWEALTH OF** (paragraphs on History).

BARYTES. The production in the United States in 1900 amounted to 67,680 short tons, valued at \$188,089, as against 41,894 tons, valued at \$139,528 in 1899. The increase in production was due to the development of new properties in Tennessee. The average price, however, declined from \$3.33 in 1899 to \$2.78 in 1900. The imports had a total value of \$32,461. Barytes is used in the manufacture of mineral paint.

BASEBALL. Mismanagement in professional baseball, which was notorious in 1899 and 1900, and became even worse in 1901, threatens to destroy popular interest in the national game. In the National League contests, the games won, the games lost, and the percentages respectively, were as follows: Pittsburg, 90, 40, 647; Philadelphia, 83, 57, 592; Brooklyn, 79, 57, 580; St. Louis, 76, 64, 544; Boston, 69, 69, 500; Chicago, 53, 86, 381; New York, 52, 85, 379; Cincinnati, 52, 87, 373. Similar figures for the American League were: Chicago: 83, 53, 610; Boston, 79, 57, 581; Detroit, 74, 61, 548; Philadelphia, 74, 62, 544; Baltimore, 68, 65, 511; Washington, 61, 72, 459; Cleveland, 54, 82, 397; Milwaukee, 48, 89, 350.

In contrast with professional baseball in 1901, college baseball flourished in all sections, with honors divided between Princeton and Harvard. These teams did not meet. The remainder of the first twelve teams may be ranked: 3, Pennsylvania; 4, Yale; 5, Brown; 6, Cornell; 7, Dartmouth; 8, Amherst; 9, Williams; 10, Lafayette; 11, Wesleyan; 12, Lehigh. Princeton won 19 games and lost 2; Harvard won 18 and lost 2; Yale won 20 and lost 8. Yale and Princeton played three games, in which Princeton made 28 runs and Yale 16; Harvard v. Yale's two games resulted: Harvard 10 runs and Yale 3; Harvard v. Pennsylvania's two games resulted: Harvard 21 and Pennsylvania 6. In the Triangular League—Amherst, Williams, and Wesleyan—Amherst won 5, lost 3; Williams won 4, lost 4; Wesleyan won 3, lost 5. West Point played Annapolis for the first time and won by a very narrow margin. The University of Pennsylvania defeated Cornell, 14 to 4; Georgetown, 8-4; Brown, 8-2 and 4-3; but lost to Harvard, 3-11.

A uniform effort on the part of the faculties of Harvard, Yale, and Princeton, and the Intercollegiate Association of the South, sensibly diminished the number of players on college teams, who have become quasi-professionals by accepting board and other expenses for playing during the summer vacations.

BASKERVILLE, CHARLES, professor of chemistry in the University of North Carolina, announced in 1901 the discovery of a constant unknown impurity found in monazite, to which, in case it should prove a new element, he has provisionally as-

signed the name of "Carolinium" (see CHEMISTRY). Dr. Baskerville was born in Noxubee County, Miss., June 18, 1870, and studied at the universities of Mississippi and Virginia, graduating from the latter in 1890. Subsequently he pursued graduate studies at the University of Berlin, from which he received the degree of Ph.D. in 1893. In 1891 he became connected with the teaching staff of the University of North Carolina, and in 1900 was made professor of chemistry and director of the laboratories. He has served as secretary of the council and general secretary of the American Association for the Advancement of Science, being an active member of the section of chemistry. He is a member of the leading chemical societies of the world.

BASKET BALL. The championship in basket ball in 1901 was won by the Pratt Institute (Brooklyn) team. The game was played in 1900-01 by the universities of Princeton, Pennsylvania, Columbia, Harvard, and Yale, and by numerous schools and teams of the Y. M. C. A., with whom it is a favorite gymnasium game.

BASUTOLAND, an inland colony of Great Britain lying between Natal, Cape Colony, and the Orange River Colony. It has an estimated area of 10,293 square miles and an estimated population of 250,000. No Europeans are allowed to settle in Basutoland without the permission of the government. There are four government schools and 177 private schools, with over 11,000 pupils, of whom about 90 per cent. are educated under the supervision of the French Protestant mission. The principal products are grain, wool, and cattle. In the fiscal year 1900 the revenue and expenditure amounted to £69,769 and £59,492 respectively, and the exports were valued at £133,861 and the dutiable imports at £85,527.

BATCHELDER, RICHARD NAPOLEON, brigadier-general U. S. A. (retired), died in New York City, January 4, 1901. He was born at Lake Village, N. H., July 27, 1832, and at the outbreak of the civil war entered the volunteer service as first lieutenant in the First New Hampshire regiment. Soon afterwards transferred to the quartermaster's department, he remained there throughout the war, being brevetted brigadier-general, March 13, 1865. Later he entered the regular service as captain and assistant quartermaster, and rose to be quartermaster-general, with the rank of brigadier-general, retiring in 1896. During the war General Batchelder was present at many important engagements, and was awarded a medal of honor for his services as quartermaster with the Army of the Potomac. While quartermaster-general he instituted many innovations and reforms, to the great improvement of the service.

BATH HOUSES, MUNICIPAL. See MUNICIPAL BATH HOUSES.

BATTERSON, JAMES GOODWIN, American builder, died at Hartford, Conn., September 18, 1901. He was born at Bloomfield, Conn., February 23, 1823, and was trained in his father's business, that of stone-cutting. As head of the New England Granite Works, Mr. Batterson erected many notable monuments and public buildings, including the national monument at Gettysburg, the statue of Alexander Hamilton in Central Park, New York City, soldiers' monuments at Antietam and Galveston, and the Halleck monument at San Francisco. The most notable of the buildings erected by him are the Congressional Library at Washington and the Connecticut State Capitol at Hartford. In 1858-59 he was in Egypt with Brunel, and became interested in engineering problems, geology, and Egyptology, and was a recognized authority in this last subject, being honorary secretary of the Egyptian Exploration Fund.

BATUM PIPE LINE. See RUSSIA.

BAUXITE. The production of bauxite, which is used in the production of aluminum, in 1900 amounted to 23,184 long tons, valued at \$89,676, as compared with 35,280 long tons, valued at \$125,598 in 1899. The deposits in the Georgia-Alabama district are rapidly giving out, while Arkansas, which began producing in 1899, promises to be of great importance. C. W. Hayes (*The Bauxite Deposits of Arkansas*, United States Geological Survey 21st Annual Report, part III.) states that the Arkansas deposits are confined to an area of 20 by 5 miles lying southwest of Little Rock. He estimates that in the outcrops alone there are 608,500 long tons of bauxite in sight, while the total quantity under cover is 43,711,200 long tons. Several of the companies that have been operating in Georgia have moved to newly purchased bauxite property in Arkansas. See ALUMINUM and CRYOLITE.

BEACH, WILLIAM WITHER BRAMSTON, British legislator, died in London, August 3, 1901. He was born in Hants, England, December 25, 1826, and was educated at Eton and Oxford. Elected first a Conservative member of parliament in 1857, he sat continuously as a representative for North Hants until the redistribution of seats in 1885, when he was sent from Andover. Mr. Beach was made a privy councillor in 1900, and since 1899 he was known as the "father of the House of Commons."

BEAMISH, HENRY HAMILTON, C.B., British rear-admiral, died at Brasted, Kent, England, July 19, 1901. He was born in Buckinghamshire in 1829, and entered the navy in 1845, after being privately educated. After serving in India (1851-53), in the Baltic during the Russian war of 1854-55, in the China seas, as naval aide-de-camp to Lord Elgin at the capture of Canton, and at the capture of the Peiho forts (1858), he was promoted to commander, and received the China medal with clasps. He also saw service on the west coast of Africa, in conflict with slavers.

BECHUANALAND PROTECTORATE, a British protectorate situated between the Zambesi River, the Transvaal, Cape Colony, and German Southwest Africa. It has an estimated area of 213,000 square miles and an estimated population of 200,000. The natives are ruled by their own chiefs, under the ultimate control of a resident commissioner appointed by the high commissioner for South Africa. The principal products are maize, wool, cattle, and hides, which are exported in considerable quantities. Revenue is derived chiefly from customs duties and the native hut tax. In 1897 the revenue amounted to £47,511 and the expenditures to £88,448. Order is preserved by a mounted police force of about 150 men.

BECKER, GEORGE FERDINAND, American geologist, was made a member of the National Academy of Sciences at its spring meeting in 1901. Dr. Becker was born in New York, January 5, 1847, and after graduating at Harvard in 1868 pursued further studies in Europe, taking the degree of Ph.D. at Heidelberg in 1869 and two years later passing the examination of the Royal School of Mines in Berlin. In 1875 he became an instructor in the University of California, and four years later joined the United States Geological Survey, where the greater part of his scientific work has been accomplished. He was a special agent for the tenth census, and has conducted numerous investigations for the government. Chief of these have been the examination of the gold mines of South Africa and the geological condition of the Philippines. For this latter purpose he was assigned to the army of occupation, and he prepared a valuable and comprehensive report on the mineral deposits of the islands. Dr. Becker is at present in charge of the division of chemical and physical research of the United States Geological Survey. He is the author of *The Geology of the Comstock Lode*; *Statistics and Technology of Precious Metals* (with S. F. Emmons); *Report on the Gold Fields of South Africa*, the *Southern Appalachians*, and *Alaska*; and *Report on the Geology of the Philippines*.

BEET SUGAR. See SUGAR INDUSTRY.

BEHRING, DR. EMIL ADOLF, the German physician who received the Nobel prize (*q.v.*) in medicine in 1901 for his discovery of the serum of diphtheria, was born at Hansdorf, in the province of West Prussia, March 15, 1854. After being educated at the Imperial Military School of Medicine in Berlin, he became an assistant surgeon in the army in 1880. In 1883 he joined a regiment of cuirassiers in Silesia, and in 1887 was made a surgeon of the first rank at the military post at Bonn. A year later he joined the faculty of the Berlin Military School, at the same time becoming a lecturer at the Hygienic Institute. In 1894 he was appointed a lecturer on hygiene at Halle, and the following year he removed to Marburg to take a similar position, and resigned from the army. In 1896 he was appointed to the Marburg board of health. Besides his achievements in the investigation of diphtheria, he has won prominence in the study of tetanus, and for his work in these subjects he received from the Paris Academy of Medicine one-half of a special prize of 25,000 francs, and also one-half of the Alberti Levi prize of 50,000 francs from the Paris Academy of Science. He has published *Die Blutserumtherapie* (1892); *Gesammelte Abhandlungen zur ätiolog. Therapie von ansteckenden Krankheiten* (1893); *Die Geschichte der Diphtherie* (1893); and *Bekämpfung der Infektionskrankheiten* (1894).

BELGIUM, a constitutional monarchy of western Europe lying south of the Netherlands and bordering the North Sea. The capital is Brussels.

Area and Population.—The aggregate area of the nine provinces comprising Belgium is 11,373 square miles. The population, according to the census of December 31, 1890, was 6,069,321, and according to the official estimate of December 31, 1900, 6,815,054; of the latter number 3,398,997 were males and 3,416,157 females. The annual birthrate is 29 and deathrate 20 per 1,000, and the immigration exceeds the emigration. At the end of 1900 Antwerp had 285,600 inhabitants; Brussels, 211,449 (with suburbs, over 570,000); Liège, 173,706; Ghent, 160,049. The immigrants and emigrants in 1898 numbered 27,393 and 22,860 respectively, and in 1899 26,364 and 22,957 respectively. Almost the entire population is Roman Catholic. At the beginning of 1899 there were 6,694 public primary schools with 774,989 pupils, 128 public secondary schools with 22,870 pupils, and 35 public atheneums and colleges with 7,440 students. In addition, there were 2,065 public infant schools with 194,807 pupils, 2,299 public adult schools with 102,531 pupils, and 57 public normal schools with 3,848 students. There are four universities—Louvain, Liège, Ghent, and Brussels.

Government.—The executive authority is vested in the king, who is assisted by a ministry whose members are appointed by him and are responsible to the chamber of representatives. The king is Leopold II., who ascended the throne in December, 1865. The legislative power devolves upon the king and a parliament consisting of a senate and a chamber of representatives. In 1901 the premier and minister of finance and public works was M. de Smet de Nayer (appointed August 5, 1899); minister of foreign affairs, M. Paul de Favereau (appointed February 25, 1896); minister of the interior and instruction, M. de Trooz (appointed August 5, 1899); minister of war, General Cousebant Alkemade (appointed August 5, 1899).

Army.—The regular army is formed by conscription, the annual contingent being about 13,500 men. The peace strength of the army in 1901 was 51,448, of whom 3,666 were officers; the infantry numbered 1,921 officers and 27,788 men, the cavalry 370 officers and 5,770 men, and the artillery 633 officers and 8,682 men. The strength of the army on a war footing is placed at 143,000 men. There is a national guard numbering upward of 40,000. For the army bill under consideration by the parliament in 1901, see paragraph on Army Reorganization.

Finance.—The Belgian unit of value is the franc, worth 19.3 cents. Revenue accrues largely from railways, taxation, excise, and customs; the largest items of expenditure are for railways and interest on the public debt. The ordinary revenue and expenditure in 1898 amounted to 439,281,906 francs and 427,180,956 francs respectively; estimates for subsequent years have been: 1899, revenue, 469,000,833 francs and expenditure 451,427,566 francs; 1900, 492,553,500 and 480,531,928; 1901, 488,429,760 and 488,047,973. The national debt, including charges, stood at 2,657,900,000 francs at the end of 1899 and 2,708,500,000 francs at the end of 1900. Almost the entire debt has been devoted to public works, especially the construction of state railways.

Industries.—Belgium is essentially a manufacturing country, though mining, especially coal and iron, and agriculture are of some importance. The principal crops are oats, rye, wheat, potatoes, and beets. The following figures are for 1899: Coal raised, 22,072,068 tons (metric), valued at 274,400,000 francs; iron ore, 201,445 tons; manganese ore, 15,120 tons; cast iron produced, 1,024,576 tons, valued at 74,400,000 francs; steel wares manufactured, 633,950 tons, 96,100,000 francs; iron wares, 475,198 tons, 76,400,000 francs; zinc products, 122,843 tons, 74,600,000 francs; glass wares, 76,300,000 francs; lead products, 5,900,000 francs; quarry products, 55,400,000 francs; raw sugar, 188,026 tons; refined sugar, 66,725 tons; beer, 1,370,634 hectolitres. There are factories for the production of textiles, laces, leather goods, etc.

Commerce.—The special trade of Belgium has been reported as follows: 1898, imports and exports, 2,044,700,000 francs and 1,787,000,000 francs respectively; 1899, imports 2,260,200,000 francs and exports 1,949,300,000 francs; 1900, imports 2,215,800,000 francs and exports 1,922,400,000 francs. Statistics for the first nine months of 1901 showed that, notwithstanding a so-called industrial crisis, the value of the imports was 2 per cent. greater than that for the corresponding period of 1900; a decrease of 2 per cent., however, was noted in the exports. In order of importance the leading countries exporting to Belgium are France, Great Britain, Germany, the United States, Netherlands, and Argentina; while the most important countries receiving Belgian products are, in order: Germany, Great Britain, France, and Netherlands. The values in francs of the principal imports (special trade) in 1899 were: Cereals, 338,039,000; raw textiles, 288,189,000; metals, 119,317,000; resins, etc., 96,380,000; minerals, 88,644,000; chemicals and drugs, 71,444,000; raw hides, 70,010,000. Similar figures for exports were: Raw textiles, 164,599,000; cereals, 109,743,000; iron, 88,378,000; glass, 87,829,000; raw and tanned hides, 72,762,000; chemicals and drugs, 70,954,000; tissues, 62,969,000; machinery, carriages, etc., 47,671,000; raw and refined sugar, 45,086,000.

Communications.—Belgium has over 5,700 miles of public roads and nearly 1,400 miles of navigable rivers and canals. At the end of 1899 there were open for traffic 2,850 miles of railway, of which the state operated 2,521 miles.

HISTORY.

The Suffrage Question.—The year 1901 was marked in Belgium by long and heated parliamentary discussions regarding various reforms, with very little legislation resulting therefrom. Propositions for a reform of the suffrage consumed more time than any other, and threatened to disrupt the forces of the opposition, comprising the Liberals, the Progressists or Radicals, and the Socialists, who had come together on a common anti-clerical platform in 1900. The position taken by the Liberals and Socialists in favor of proportional representation had practically forced the Clerical majority to consent to a law providing for that reform in connection with parliamentary elections. As a result, the reformed Parliament chosen in 1900 had shown an increase in the Socialist and Liberal members of over 65 per cent.

The programme proposed by the Socialists and Progressists at the opening of the session of 1901 was the abolition of plural voting, the establishment of universal suffrage, and the extension of proportional representation to the communal elections. The Liberals, who had obtained control of the city governments in Brussels, Antwerp, Ghent, and other cities by means of the plural voting, at first refused to accede to any programme which would alter in any degree the situation in the communes, but finally, coming to the conclusion that the Clerical party would never agree to a law providing for universal suffrage while it maintained a majority in Parliament, agreed, for the sake of harmony, to join the other elements of the opposition in a general demand for reform of the suffrage. In July the opposition united in a demand for a fairer apportionment of electoral districts, and declared their intention of throwing light on the "fraud" which enabled the Clerical party to disfranchise over 100,000 heads of families. The debates showed a disposition on the part of all elements of the opposition to favor a general revision of the constitution, but a Progressist proposal for a referendum on the question of plural suffrage and a declaration of the Socialists favoring woman's suffrage received very little support.

The Anti-Gambling Measure.—A bill for the suppression of licensed gambling places, introduced in February, 1901, was before Parliament in one shape or another for the greater part of the year. Belgium has been for some time, with the exception of Monaco, the only country where gambling has been licensed by the state, and there has been considerable agitation in the past few years looking toward its suppression. The bill as originally introduced in the senate provided for the prohibition of gambling in public places where stakes were generally known, or where their importance was sufficient to make them a motive for gain. Special dispensation was provided for the notorious gambling places at Ostend and Spa. The lower house rejected the latter proposition and sent the bill back to the senate, where amendments destroying its usefulness were made. After that the bill passed back and forth between the senate and the chamber until late in December, the senate holding out for privileges or remuneration for the gambling corporations at Ostend and Spa and the lower house insisting on their unqualified suppression. The chamber finally triumphed and the bill was passed.

Army Reorganization.—The army reorganization bill was another measure that took up a considerable part of the Parliament's time. The reform measure as proposed by the government increased the war strength from 145,000 to 180,000, and the annual contingent from 13,500 to 18,000. Volunteering was to be encouraged by decreasing the term of service and paying those who could not afford to give their time, and the privilege of substitution (*remplacement*) among those drawn by conscription was to be curtailed. This bill was opposed by a strong anti-militarist combination in Parliament, but there was no union on any one plan. Numerous schemes were laid before the chambers, but few received any concerted support, although the tendency of all was to increase the volunteer character of the army, and do away with conscription as much as possible. In October, 1901, the Progressists and Socialists agreed on a bill which provided for the absolute abolition of substitution and of drawing by lot, and for the prohibition of special exemption for the rich. A radical reduction in the term of service was proposed. The bill was still under discussion at the end of the year.

Other Events of the Year.—Late in December the government Sugar Bounty bill, providing for a bounty of 2 francs per 100 kilometres up to a total of 5,000,000 francs annually, was passed by the chamber. The question of the annexation of the Congo Free State (*q.v.*) was left in *statu quo*, Parliament merely reaffirming its right of option to annex the state, and leaving it to the king to decide when this should take place. On November 3, 1901, a son and heir was born to Prince Albert, the heir apparent (who married the Princess Elizabeth, of Bavaria, in October, 1900), thus insuring an heir to the throne in direct line. Late in May the Charleroi glassmakers' strike, which had been maintained since August 1, 1900, was terminated by the decision of the strikers to resume work. The strike, which involved a loss in wages of nearly \$2,500,000, was the longest industrial struggle that has occurred in Belgium. As its chief object was to compel the operators to employ only union laborers, the outcome must be considered a signal victory for free labor. An old-age pension law enacted in 1900 became operative on August 1, 1901. There were at that time 165,000 applicants for the annual 65-franc pension.

BELIZE. See BRITISH HONDURAS.

BELKNAP, CHARLES, commander U. S. N., died at Baltimore, Md., June 15, 1901. He was born at Jersey City, N. J., August 25, 1846, entered the navy as a midshipman in 1864, and graduated at the Naval Academy in 1867. Appointed lieutenant (1871), he was on duty at the Naval Academy until 1876, when he went to the Asiatic station, returning again to the Academy in 1879. In 1889 he was promoted to lieutenant-commander, and served at Newport (1891) and again at the

Naval Academy (1894). He was made commander in 1896, and was sent to the Academy again in 1897, from which he was detached to command the collier *Nero*, in the Spanish-American war. At the close of the war he was assigned to the command of the training-ship *Dixie*, and at the time of his death he was the senior member of the board for the examination of warrant officers at the Washington navy yard.

BELL, ROBERT, F.R.S., was appointed in 1901 director of the Geological Survey of Canada, succeeding the late Dr. G. M. Dawson (*q.v.*). He was born at Toronto, June 3, 1841, and at the age of 15 became connected with the Geological Survey of Canada, serving as assistant for three years, and at the same time studying at McGill University. In 1860 he was made an active member of the survey, and since that time has surveyed and explored in the Gaspé peninsula, the Saguenay and Lake St. John country, the region about the Gulf of St. Lawrence, Newfoundland, Nova Scotia, and New Brunswick, and has traveled completely around the Labrador peninsula. In the western and northern regions of the Dominion Dr. Bell has been no less active and has been termed "the place-name father" of Canada, inasmuch as he has had to give names to new and unexplored regions. He was medical officer, geologist, and naturalist on the *Neptune*, Hudson Bay expedition in 1884, and accompanied the *Alert* expedition in 1885 and the *Diana* expedition in 1897 in a similar capacity. He received the degree of LL.D. from Queen's University, Kingston, in 1883, and enjoys the reputation of being one of the foremost of American explorers.

BELOOCHISTAN, or BELUCHISTAN. See BALUCHISTAN.

BENOIT, PIERRE LEOPOLD LEONARD, Belgian composer, died at Antwerp, March 5, 1901. He was born August 17, 1834, at Harlebeke, in West Flanders, and received his musical education at the Conservatory of Brussels. At his graduation in 1857 he won the royal prize for composition, which enabled him to visit and study at the musical centres of Germany, where he was a pupil of Wagner and Liszt. He studied also in Paris, and after his return to Belgium devoted himself to composition, which, while it achieved his fame, does not represent his value as a musician. His life-work was to establish and perfect a national style of composition, which he did with fair success. In 1867 he saw the Flemish School of Music founded at Antwerp as a result of his energy, and was its director from then until 1899. Some of M. Benoit's works are: *Le Roi des Aulnes* (1861), an opera; and *Lucifer* (1866); *L'Escout* (1869), and *La Guerre* (1873), oratorios.

BERMUDA, a group of small islands in the north Atlantic constituting a British colony, has an area of about 20 square miles and an estimated civilian population in 1901 of 17,535, of whom 6,383 were whites. The chief town is Hamilton (population about 2,200). The average number of imperial troops in Bermuda is about 3,000. The colony is administered by a governor, General George Digby Barker, since 1896; there is a representative legislative assembly. The public debt at the end of 1900 was £49,600; the revenue for that year was £40,124, as against £39,955 for 1899, and the expenditures £47,532, as against £39,243 for the preceding year. In 1900 the imports, of which about 60 per cent. came from the United States and 25 per cent. from Canada, amounted to £397,136 (£394,388 in 1899), and the exports, which went almost entirely to the United States and consisted chiefly of onions, potatoes, and lily bulbs, were valued at £93,769 (£119,151 in 1899). The average number of American visitors to Bermuda is about 3,000 yearly.

BERNARD, Sir CHARLES EDWARD, British-India official, died at Chamounix, France, September 16, 1901. He was born at Clifton, England, in 1837, and was educated at Rugby and Addiscombe. In 1858 he was appointed to the Bengal civil service, serving first in the Punjab as assistant commissioner, and becoming in 1869 commissioner of Nagpur. After occupying numerous minor posts in various Indian provinces, he became in 1878 secretary to the government of India in the Home Department, and three years later filled a similar office in the Revenue and Agricultural Department. From 1880 to 1888 he was chief commissioner of British Burma, and from 1888 to March, 1901, he served as secretary in the Revenue and Statistics Department of the India Office.

BERNHARDT, SARAH (BERNARD, ROSINE), French actress, who made a tour of the United States with M. Constant Coquelin (*q.v.*) in 1901, and played in a repertoire including *L'Aiglon*, *Fédora*, *La Tosca*, and *Hamlet*, was born in Paris, October 22, 1844, of Jewish parentage. A part of her childhood was spent with her grandfather, an optician of Amsterdam, and she was then placed in a convent at Versailles, where she became interested in the study of the stage. At fourteen she entered the Paris Conservatoire, where she won prizes both in comedy and tragedy parts, and in 1862 made her début as Iphigénie in Racine's tragedy at the Théâtre Français. In the same year she acted the leading rôle in Scribe's *Valérie*. But her success in these parts was doubtful, and she retired for further study, acting only in burlesque until 1867, when she took up legitimate comedy. In this field her first

great success was won in the rôle of the Queen in *Ruy Blas* at the Odéon, after which she was recalled to the Théâtre Français. Here she remained until 1880, when, after a tour of Europe and America, she established herself (1883) at the Théâtre Porte Saint Martin. In 1893 she became director of the Théâtre de la Renaissance, and in 1898 built the Théâtre Sarah Bernhardt. In 1882 she married M. Jacques Damala, from whom she was divorced in the following year. Mme. Bernhardt has won success in so many rôles that it is impossible to single out one of her creations as the greatest. Among those most familiar may be mentioned her Phédre, in the play of the same name; Dona Sol, in *Hernani*; Mistress Clarkson, in *l'Etrangère*; Fédora, in Sardou's play of the same title; parts in *Frou-Frou* and *La Dame aux Camélias*; Hamlet, in a French version of Shakespeare's tragedy, and L'Aiglon, in Rostand's play of that name. Previous to 1901 she had made three visits to the United States—in 1880, 1887, and 1891. She is a sculptor of some attainment, having won an honorable mention in 1876, and a silver medal at the Paris Exposition of 1900. A number of her paintings have been exhibited at the Salon, and she has written several plays, one of which, *l'Aven*, was produced at the Odéon in 1888. She has published novels serially in newspapers, and a volume descriptive of a balloon voyage under the title, *Dans les nuages, impressions d'une Chaise* (1878).

BERTHELOT, PIERRE EUGÈNE MARCELIN, the French organic chemist, celebrated, on November 24, 1901, the fiftieth anniversary of the publication of his first memoir by meeting a gathering of the most famous men of science of France at the Sorbonne, in Paris. M. Berthelot was born October 25, 1827, and after graduating at the College of Henry IV., where he won distinction in philosophy and history, as well as in science, was, in 1851, appointed an assistant in chemistry at the College of France, a place which he retained for nine years. While there he was chiefly concerned with the problem of producing by artificial means substances which had before been regarded as purely the product of nature. One of his achievements was the production of alcohol from illuminating gas and water; and this was followed by a series of important experiments on the synthesis of the carburets of hydrogen. The results of these experiments M. Berthelot published in 1858, and three years later he was awarded a prize of 3,500 francs by the Academy of Sciences. In 1862 he succeeded in effecting the direct combination of carbon with hydrogen, forming acetylene. Meanwhile, in 1859, he had been made professor of organic chemistry in the College of Pharmacy, and upon the creation of a similar chair in the College of France in 1865 was installed as its permanent incumbent. From that time he devoted himself wholly to the investigation of his special branch of chemistry, coming to be regarded in time as the practical creator of chemical mechanics, or thermo-chemistry. He was among the first to succeed in liquefying gas. In 1881 he was made a senator for life by the French government; five years later he served for a few months as minister of public instruction in the Goblet cabinet, and in 1895 he held the portfolio of foreign affairs in the Bourgeois cabinet. M. Berthelot is a member of nearly all the scientific societies of Europe, and recently he was chosen a member of the French Academy. His published memoirs number over six hundred, and his contributions to periodical literature have been numerous.

BESANT, Sir WALTER, English essayist and novelist, died in London, June 9, 1901. He was born at Portsmouth, England, August 14, 1836, and was educated at King's College, London, and at Christ's College, Cambridge, graduating from the latter in 1859. Appointed senior professor at the College of Mauritius, French Island of Mauritius, East Africa, in 1861, Mr. Besant remained there for six years. Ill health necessitated his return to England, where he devoted his energy to writing, and in 1868 his first book, *Studies in Early French Poetry*, appeared. From this time to 1874 he was a frequent contributor to various newspapers and periodicals, forming (1871) a literary partnership with James Rice, which was one of the happiest known to letters. This alliance remained unbroken until Rice died in 1882, and among the books that resulted may be mentioned *The Golden Butterfly* (1876); *Ready Money Mortiboy* (1872), and *The Seamy Side* (1881). Thereafter Mr. Besant devoted himself principally to writing novels, among which are *All Sorts and Conditions of Men* (1882), which is perhaps the best known, and practically started the social movement resulting in the building of the People's Palace in London; *Dorothy Forster* (1896); *The City of Refuge* (1896), and *The Orange Girl* (1889). Of his essays the most notable are, *The French Humorists*, *Rabelais*, and *lives of Coligny, Whittington, Edward Palmer, and Richard Jefferies* (1892), *South London* (1898), and *East London* (1900). Most of his novels display a keen perception of varied social conditions and a minute portrayal of character; some of them, particularly toward the close of his career, were written for the achievement of specific social reforms. Sir Walter founded in 1884 the Society of Authors, an organization designed to secure for authors, especially the young and inexperienced, fair treatment at the hands of publishers. He was knighted in 1895.

BESSONIES, Rt. Rev. Mgr. AUGUST, American Roman Catholic prelate, died at Indianapolis, February 22, 1901. He was born near Cahors, France, June 18, 1815, and studied for the ministry at Issy and St. Sulpice in Paris, graduating at the latter seminary in 1838. The next year he came to the United States as an assistant to Bishop Brute, of Vincennes, Ind. He was ordained priest in 1840 and sent out to labor among the Indians in Perry County, of that State, where he remained for ten years. He had charge of various parishes throughout the State, finally becoming established at Indianapolis in 1857. In 1881 he became vicar-general of his diocese and received the rank of monseigneur in 1884. Father Bessonies was a tireless temperance worker, was deeply interested in home missionary work, and was respected and esteemed by his associates, of whatever denomination.

BIBLE SOCIETY, AMERICAN, founded in 1816 for the distribution of bibles among the destitute and poor. At the close of the fiscal year 1900-01 the society had issued a total of 68,953,434 copies of the Scriptures. The total issues of the year amounted to 1,554,128 copies, nearly two-thirds of which were sent to foreign countries. More than half of the issues were manufactured at the Bible House, and of the remainder a large number were printed in Syria, Turkey, Siam, China, and Japan. The income of the year, from gifts, funds, etc., was \$391,383, nearly half of which has been authorized for the foreign work during the current year. Since its organization the society has received over \$30,000,000 from the public in America. Publications: The *Bible Society Record*, an illustrated monthly, and annually thousands of leaflets in various languages. Secretaries, Rev. John Fox, D.D., and Rev. William I. Haven, D.D., Bible House, New York City.

BICYCLING. See CYCLING.

BIEDERMANN, KARL, German politician and philosopher, died at Leipsic, March 5, 1901. He was born at Leipsic, September 25, 1812, and was educated at Heidelberg and the university of his native city, becoming professor of philosophy at the latter in 1838. For political reasons he was dismissed in 1845, and in 1848 began an active career in politics with his election to the National Assembly at Frankfort in that year. He was restored to his professorship in 1849, but was removed again in 1854 for editorial utterances in the *Deutscher Annalen*. In 1865 he was again reinstated and in 1874 was made an honorary professor. Throughout his political prominence, which was terminated by his resignation from the *Reichstag* in 1874 and from the Saxton Landtag in 1876, Professor Biedermann adhered to the most pronounced liberal ideas, which he expressed fearlessly in various political papers of which he was editor at different times. A prolific writer, he produced, among other works, *Die Deutsche Philosophie von Kant bis auf unsere Zeit* (1843); *Erinnerungen aus der Paulskirche* (1849); *Gedankens* (1892); *Fünfaig Jahre im Dienste des Nationalen Gedankens* (1892); *Vorlesungen über Socialismus und Socialpolitik* (1900); and the dramas *Heinrich IV.* (1861) and *Kaiser Otto III.* (1862).

BILLIARDS. The amateur championships of 1900-01 were carried through by the Amateur Athletic Union. Class B events (14-inch balk-line) were held December 5-17, 1900, at the Knickerbocker Athletic Club, New York City. A. G. Cutler, of Boston; J. A. Hendrick, of New York, and W. W. Kellogg, of Chicago, tied for first place with 4 out of 5 games each. By a previous agreement, made during the tournament, the championship was accorded to Cutler, as his grand average for the last two games was 7.19, against 5.37 for Kellogg and 5.17 for Hendrick, who took second and third prizes respectively. The average for the whole tournament for the three was respectively 7.13, 4.61, and 5.70; high runs, 48, 41, and 48. Cutler also made the best single average, 9.67, in his first game. The class A tournament (14-inch balk-line, anchor-nurse barred) was held at the same place during February 5-16, 1901. C. Fred. Conklin, by defeating all his opponents, won the honor of playing the holder of the championship, Wilson P. Foss, of Haverstraw, N. Y., in the finals. In a game requiring 46 innings Conklin led during the first half, but Foss won by 500 points to Conklin's 238, with an average of 10.40-46. Foss's highest run was 69. Conklin's highest run was 43, his average 5.32-46.

BIOLOGICAL STATIONS. See ZOOLOGICAL EXPEDITIONS AND STATIONS.

BIOLOGY. The progress of biology during 1901 was not unusually notable, but there were some forward steps taken which are worthy of mention. Most important of all is undoubtedly the work of Hugo de Vries, of Amsterdam, which throws much light upon questions of evolution. Although his work has been carried on with plants as the subject of investigation, his results are distinctly biological and not specially botanical. The report of his work is entitled *Die Mutationstheorie*, and is published at Leipsic. His results may be briefly summarized thus: He examined 50,000 plants of an evening primrose (*Oenothera lamarckiana*), descendants under natural conditions of a single plant. Of these, 49,200 were distinctly plants of the

same type, showing no tendency toward gradual change in any direction, but 800 showed such a marked change that they could not properly be called *Ce. lamarckiana*. They represent no less than 7 distinct types of structure, which De Vries calls species; of the one he calls *gigas*, there was 1 specimen, of *scintillans* 8, of *rubrinervis* 32, of *albida* 56, of *nanella* 158, of *lata* 221, and of *oblonga* 350. But more remarkable still is the fact that these species tend to reproduce their own kind; thus, the one plant of *gigas* gave rise to 450 plants, all but one of which were distinctly *gigas*. So far as De Vries's observations go, therefore, new species may appear suddenly by mutation, and not by the process of progressive variation. In other words, De Vries has actually seen the formation of new species in nature. The results of these observations are far-reaching, and if they are subsequently confirmed in other cases among plants and in the animal kingdom, they will prove to be the most important contribution to biological evolution that has appeared for many years. A new and fascinating field of research is thus opened up, and new life is infused into the old problem of the origin of species.

Another contribution to the theory of evolution is a paper by Mr. O. F. Cook, read before the Biological Society of Washington, and called *A Kinetic Theory of Evolution*. Mr. Cook points out that the differentiation of species is a phenomenon distinct from evolutionary progress, and that the relative importance of natural selection has differed greatly in the evolution of the various natural groups. He says further that "there is no essential connection between evolution and use. The vast majority of variations and specific differences are also obviously non-useful." "All hereditary characters are acquired, but not all acquired characters are hereditary." "Reactions to external conditions are not hereditary." "No direct nexus between environment and heredity has been demonstrated, and none is necessary under a kinetic theory." Mr. Cook's views are based primarily upon his observations in myriapods, but he has also studied termites, and various groups of plants. His conclusions are of special interest when compared with those of De Vries given above.

A paper of great importance by Prof. E. B. Wilson, of Columbia University, has appeared, recounting his observations upon the centrosomes of eggs which have developed by artificial parthenogenesis. According to him, there is little difference in the centrosomes of such eggs and those of normal ones, except that the cytasters are much better developed. Moreover, in normal fertilization "the activity of the egg-nucleus is modified through its union with an active individualized sperm-centrosome, the presence of which inhibits the formation of an egg-centrosome such as occurs in the magnesium eggs." Professor Loeb, of the University of Chicago, has continued his work upon the effect of chemicals upon the unfertilized eggs of marine animals, and, as was the case in 1900, his valuable and interesting results were seized upon by the sensational daily press, and distorted into the most grotesque statements of the discovery of the secret of perennial youth and the possibilities of unending life in our present bodies. No investigator of recent years has been so persistently exaggerated and misrepresented as has this distinguished physiologist. The most interesting of his results during 1901 were those on the effects of cyanide of potassium upon the eggs of the sea-urchin, which indicate that that poison acts under certain conditions as a preservative of life and a protection against what is called staleness in eggs. One other contribution to the general problems of biology may be mentioned; namely, A. G. Mayer's account of the *Variations of a Newly Arisen Race of Medusa*. Of 1,000 specimens of a hydromedusa, *Pseudoclytia pentacta*, occurring at the Dry Tortugas, 703 are normal pentactate individuals, while the others have 4, 3, 2, 6, 7, or 8 radial canals or lips, though 50 per cent. of them are radially symmetrical. The abnormal individuals appear to survive as well as normal ones, and mature their reproductive cells quite as commonly. They are not weeded out by natural selection, but they have not yet established new species. These observations are of great interest in connection with the recent discoveries of De Vries, to which reference has already been made. See ZOOLOGICAL EXPEDITIONS AND STATIONS and ZOOLOGICAL LITERATURE; also PHYSIOLOGY, CHEMICAL.

BIRD PROTECTION. See ORNITHOLOGY.

BIRTHRATE. See VITAL STATISTICS.

BISHOP, JOEL PRENTISS. American lawyer and legal writer, died at Cambridge, Mass., November 4, 1901. He was born at Volney, N. Y., in 1814, and was educated at Whitestone Seminary, the Oneida Institute, and the Stockbridge Academy. Admitted to the bar in 1844, he became active in the anti-slavery movement before the Civil War, and published in 1864 *Effect of Secession on Slavery*. Mr. Bishop was best known as the author of a long series of legal text-books, among which may be cited: *Commentaries on Criminal Procedure* (1867); *The First Book of the Law* (1868); *Law of Marriage and Divorce* (1869); *Doctrines of the Law of Contracts in Their Principal Outlines* (1878); a volume on *Civil Practice* (1882), and *Common Law and Codification* (1888).

BISMARCK ARCHIPELAGO, a group of islands in the Pacific ocean belonging to Germany, formerly called New Britain Archipelago, and renamed in 1884, when they came under German control, have an estimated area of 19,200 square miles and an estimated population of 188,000. There are only about 200 European inhabitants, of whom half are Germans. The principal islands are Neu Pommern, Neu Mecklenburg, Neu Lauenburg, New Hanover, Admiralty, Anchorite, Commerson, and Hermit. Missionary work is established by the Wesleyans and Catholics. The trade is controlled by the German New Guinea Company. The imports for 1899 amounted to a value of 1,060,00 marks; exports, 939,110 marks (the mark equals 23.8 cents). The export is chiefly copra, little agriculture existing, except plantations of the cocoa palm. There is steamship communication with Singapore. The capital is Matupi, where the New Guinea Company has a station.

BISMARCK-SCHÖNHAUSEN, Count WILHELM ALBRECHT OTTO, German soldier and official, the second son of Prince Bismarck, died at Varzin, Prussia, May 30, 1901. He was born at Frankfort-on-the-Main, August 1, 1852, and was educated at Bonn. After a short military service (1870-71), he entered the civil service in 1873 and became in 1879 secretary to the governor of Alsace-Lorraine. He was rapidly promoted, and in 1889 became chief president of the province of East Prussia. Count Bismarck was also a member of the *Reichstag* (1873-81) and of the Prussian Chamber (1882-85).

BISMUTOSE is an odorless, tasteless, white powder which becomes gray on exposure to light. It is insoluble in water. It is a combination of bismuth and albumin and contains 22 per cent. of bismuth. It is used with success in gastrointestinal diseases, and also locally in burns, intertrigo, and some forms of eczema.

BIZZOZERO, GIULIO, professor of pathological anatomy in the University of Turin, died April 8, 1901. He was born March 20, 1846, and was elected a fellow of the *Accademia dei Lincei* in 1883 and a senator in 1890. He was the founder of an Italian school of histology, and among his pupils was the celebrated Golzi. Professor Bizzozero's researches and discoveries dealt largely with the spinous cells of the epidermis, the functions of the medulla of the bones, the intestinal epithelium, and the morphological elements of the blood.

BLACK LEAD. See GRAPHITE.

BLODGETT, LORIN, American statistician and economist, died in Philadelphia, March 24, 1901. He was born near Jamestown, N. Y., May 25, 1823, and was educated at Jamestown Academy and Geneva (now Hobart) College. In 1851-52 he was assistant in charge of researches in climatology at the Smithsonian Institution, and for four years afterwards was engaged in Pacific railway survey work for the United States War Department. From 1863 to 1877 he was employed in the United States Treasury Department in the preparation of reports and statistics. He published *The Climatology of the United States*; *Commercial and Financial Resources of the United States*, and about 150 volumes of financial and industrial reports and statistics.

BOAT-RACING. See ROWING.

BOECKLIN, ARNOLD, Swiss painter, died at Fiesole, Italy, January 16, 1901. He was born at Basle, Switzerland, October 16, 1827, and studied art at Düsseldorf under Schirmer. After some years of further study in Paris and Rome, he went to Munich in 1858, and was called from that place to the new school of fine arts at Weimar in 1860, as teacher of landscape painting. Two years later he went to Rome, and later settled in Florence. In his landscape paintings he shows notable powers of conception, movement, and life, in subjects including the mythological as well as the purely modern landscape study. In 1868 M. Boecklin exhibited his first important work at the Paris Salon—"Petrarch in Solitude" and "Christ and the Magdalen," the latter being acquired by the museum at Basle. It was by the Basle Museum also that his picture, the "Centaur Struggle," was purchased. "The Sea Idyl," which won for M. Boecklin a medal from the Berlin Academy, is perhaps characteristic of his greatest work, and it was this picture that he sent to the Paris Exposition of 1900. "A Nymph and Fauns," bolder in conception and treatment than most of the preceding, raised a tempest of criticism, but it is admittedly the work of a man of large imagination. His pictures are to be found in nearly every large public and private collection in Germany, where his success was greatest.

BOKHARA. See TURKISTAN, RUSSIAN.

BOLIVIA, an interior republic of South America, lies between Brazil on the east and Peru and Chile on the west. The capital is La Paz.

Area and Population.—The eight departments comprising Bolivia have an estimated area of 567,430 square miles. A ninth department, the Littoral, embracing

29,910 square miles, was mortgaged to Chile after the war of 1879-80 and has never been redeemed. There is an unsettled boundary dispute with Peru. A protocol submitting to arbitration this question and others pending between the two countries was signed at La Paz on November 26, 1901. A joint Brazilian-Bolivian commission began its work of fixing the boundary between the two republics in March, 1901. The estimated number of inhabitants has been placed at over two and one-quarter million, including 250,000 uncivilized Indians, but according to an estimate of 1898 the entire population numbered only 1,310,000, comprising 79,050 whites, 299,500 mestizos, and 931,450 Indians, of whom 60,000 were classified as uncivilized. In 1901 the population of La Paz was reported at 46,000; Cochabamba, 21,896; Sucre, 20,907; Potosí, 20,000. The state religion and that prevailing among the people is Roman Catholicism. Primary instruction is free and nominally compulsory. In 1899 the reported number of primary schools was 692, the municipal schools numbering 366 and the private schools 322; the total number of pupils was 36,418. There are also schools for secondary, higher, professional, and industrial education.

Government.—The chief executive is a president, who is assisted by a cabinet of five members. The legislative power devolves upon a congress of two houses, the senate and the chamber of deputies. The president since October 26, 1899, has been General José Manuel Pando. The departments are administered by prefects. The regular army numbers about 2,500 and the national guard about 80,000.

Finance.—The monetary standard is silver and unit of value the boliviano, worth in United States money 45.1 cents on October 1, 1900, and 42.8 cents on October 1, 1901. The chief source of revenue is customs and the largest items of expenditure are for finance, war, and public works. Reports of actual receipts and expenditures are not available. The estimated revenue and expenditure for 1899 were 7,973,190 and 8,104,200 bolivianos respectively, and for 1900, 7,331,400 bolivianos and 7,930,188 bolivianos respectively. For the fiscal year 1902 the budget estimates were 10,117,700 bolivianos for revenue and 9,989,153 bolivianos for expenditure. The estimated import and export duties were 4,287,000 bolivianos and 2,091,390 bolivianos respectively, while the largest estimated expenditure was 2,748,943 bolivianos for war. The total debt, exclusive of the internal debt, in 1901, was reported at 13,857,852 bolivianos; the internal debt in 1900 stood at 3,934,250 bolivianos.

Industries and Commerce.—Agriculture and mining are the principal industries, but neither, in proportion to the capabilities of the country, is greatly developed. Aside from the minerals, the principal product is rubber; others of importance are cacao, cinchona, and coffee. Cereals and other foodstuffs are grown for domestic consumption. Of the numerous minerals that occur, the most important mined at present are silver, tin, and copper.

The revolution of 1899 was disastrous to economic conditions in Bolivia, but in 1901 these conditions showed a decided improvement. Numerous metallurgic enterprises were established and mineral industries, especially tin mining, were unusually successful. The depreciation of silver, however, has lessened the output of this metal. The rubber industry is most important in the Beni and Caupolicán districts; the export in 1899, valued at 13,560,000 bolivianos, comprised 3,151,000 kilogrammes, of which about 90 per cent. was shipped by way of the River Amazon and the remainder by the Paraguay. The rubber export in 1900 was valued at 10,403,959 bolivianos, and about the same in 1901. The principal ores exported in 1900 were: Silver, 13,691,268 pounds; tin, 8,579,539 pounds; copper, 1,025,030 pounds. The principal imports are provisions, hardware, alcoholic liquors, textiles, wearing apparel, and furniture. The values of the total imports and exports in bolivianos have been reported as follows: 1897, 12,457,242 and 21,990,455, respectively; 1898, 11,897,245 and 27,456,677; 1899, 12,839,962 and 27,365,747; 1900, 13,344,114 and 35,657,690. The exports for the last-named year were classified as follows: Mining products, 23,727,266 bolivianos; agricultural products (including rubber), 11,249,295; cattle, 297,482; manufactures, 227,041; miscellaneous, 156,606. In 1900 the leading countries from which imports were received were: Germany, 3,109,521 bolivianos; Great Britain, 2,265,307; Peru, 1,710,305; Argentina, 1,028,714; the United States, 815,555; France, 777,881.

Communications.—Inadequate transportation facilities continue to be one of the chief obstacles to industrial development in Bolivia. The roads are few and their condition is primitive. The principal routes are: Cochabamba-Sucre, 202 miles; La Paz-Oruro, 152 miles; Tarija-Tupiza, 143 miles; Oruro-Cochabamba, 127 miles; Potosí-Sucre, 90 miles; La Paz-Corocoro, 68 miles; Challapata-Sucre, 62 miles; Oruro-Lagunillas, 59 miles, and La Paz-Puerto Perez, 47 miles. The only railway is the narrow-gauge Oruro, which connects that town with Antofagasta (Chile), 575 miles distant. At Unguni, 379 miles from Antofagasta, there is an extension of 22 miles to the Huanchaca mines. An extension of the line is projected from Oruro to La Paz, the distance by rail being 37 miles greater than the length of the present cart road; the length of the entire line, accordingly, would be 764 miles.

Other proposed railways are: From Oruro to Cochabamba and the Beni River; from Colquechaca to the Oruro road; from La Paz to the River Desaguadero (under construction in 1901); from La Paz to Puerto Perez; from Potosí to Uyuni; and, among others, a continuation of the Argentine line from Jujuy. In 1901 the government accepted the proposal of a Belgian company for the construction of a port at Bahía Negra, and from there a railway to Santa Cruz, with branches to Sucre and Potosí; and for the canalization of certain rivers in eastern Bolivia and the establishment of colonies in lands for which the company had received concessions.

Events of 1901.—For certain financial and commercial considerations, including free transport through Antofagasta and the privilege of levying customs there, Chile in the fall of 1900 sought to secure from Bolivia a definite cession of the former Bolivian department, the Littoral, now mortgaged to Chile. Bolivia rejected the proposals. In the spring of 1901, however, Señor Medina, the Bolivian foreign minister, issued a circular letter to the Bolivian legations abroad, in which, while maintaining Bolivia's right to the department, he intimated that his government might accept the compensation—already mentioned in diplomatic correspondence—of about \$10,000,000 in lieu of a seaport.

In June, 1901, a British party, led by Mr. John W. Evans, started for Bolivia to continue there the work of exploration begun by Sir Martin Conway. The region to be explored comprises over 10,000 square miles, lying between the crest of the Andes and the Amazonian plain and the rivers Kaka and Beni and the River Pando (Iambopata). This region is not entirely unknown, but it has never been mapped or explored scientifically. It contains "the fertile valleys of Las Yungas and the famous gorges of the Tipuani, Mapiri, and Coroico, whence so large a part of the gold of the Incas was brought." Mr. Evans is a well-known geologist and traveler and has already done good work in western Brazil.

BORAX. The production of borax in the United States in 1900 was 24,235 short tons of crude and 1,602 tons of refined, having a total value of \$1,018,251. The total production for 1899 was 20,357 short tons, valued at \$1,139,882.

BORNEO, an East Indian island, has an estimated area of nearly 300,000 square miles and an estimated population of about 1,900,000. The northern part is under British protection; the remainder, comprising over two-thirds of the total area, is a possession of the Netherlands.

Dutch Borneo has an estimated area of 212,737 square miles and an estimated population, exclusive of several districts as yet unexplored, of about 1,181,000. Important settlements have been made in the coast districts, but the interior is not well known and is practically under the control of the natives.

British North Borneo, a protectorate having an estimated area of 31,106 square miles and an estimated population of 175,000, occupies the northeastern part of the island. The territory is administered by a governor (Edward W. Birch in 1901), who is assisted by a council and by several official residents. The revenue and expenditure for the fiscal year 1899 were 542,919 dollars (Mexican) and 410,290 dollars respectively; for 1900, 587,226 dollars and 398,152 dollars respectively. The revenue for the fiscal year 1901 was reported at about 700,000 dollars and the estimated revenue for 1902 at 820,000 dollars. The increase in revenue has been remarkable, the receipts for 1893 having amounted to only 289,000 dollars. There is no public debt. Various tropical and sub-tropical products are exported, the most important export being leaf tobacco, which amounted to 1,679,500 dollars in 1900. The total imports in 1900 were valued at 3,178,929 dollars, as against 2,456,999 dollars in 1899, and the total exports at 3,336,621 dollars, as against 3,439,560 in the preceding year. In the fall of 1901 there were under construction, from Brunei Bay into the interior and thence to Jesselton, in Gaya Bay, 110 miles of railway, of which about 90 miles were practically completed; and over 400 miles of telegraph were in operation.

Brunei, on the north coast, is a native state under British protection, having an estimated area of 3,000 square miles, though various other estimates are given, and an estimated population of 50,000. It is not unlikely that the latter figure is too large. The internal administration is in the hands of a native sultan, who is assisted by various chiefs. The chief export is sago, but there is little trade and the revenue is small.

Sarawak, a British protectorate on the north coast southwest of Brunei, has an estimated area of 50,000 square miles and an estimated population of 500,000. The state is administered by Rajah Sir Charles Anthony Brooke.

According to a British consular report the situation in Sarawak in 1900 was highly satisfactory, trade and agriculture being on the increase. To increase the production of rice so that Sarawak may be able to supply herself, an attempt was being made in 1901, with the support of the government, to form two colonies of Chinese agriculturists on the Rejang River. The revenue and expenditure, which in

1890 amounted to 413,000 dollars (Mexican) and 915,966 dollars respectively, reached in 1899 851,438 dollars and 843,230 dollars; in 1900, revenue 915,996 dollars, expenditure 901,172 dollars. The total trade of 1900 was nearly twice that of 1895, the imports amounting to 3,848, 679 dollars, as against 3,281,609 dollars in 1899, and the exports 5,217,036 dollars, as against 4,476,066 dollars in 1899. In 1900 the leading exports in order of importance were pepper, sago, flour, gutta-percha, gold, and rubber.

BORNIER, Vicomte HENRI DE, French poet and dramatist, died in Paris, January 29, 1901. He was born at Lunel, Hérault, December 25, 1825, was educated at Versailles, Montpellier, and Saint-Pons, and later studied law in Paris. In 1845 appeared his first drama, in verse, *Le Mariage de Luther*, which attracted the notice of the minister of public instruction and caused Bornier's appointment to the Bibliothèque de l'Arsenal, of which he became administrator in 1889. He twice obtained prizes from the Institute for poetry (1861 and 1863), and once for oratory (1864). He was three times laureate of the Institute and was decorated by the Legion of Honor in 1864 and promoted to officer (1891). M. Bornier, while he achieved success and fame as a poet, was more notable as a dramatist, although some of his productions were never presented. His most celebrated work is *La Fille de Roland* (1875), a drama which won an instant success from the fervid patriotism of its lines. Others that require mention are *Les Noces d'Attila* (1880); *l'Aretin* (1883), and *Mahomet* (1890). The last-named was suppressed in deference to the religious belief of the Mohammedan allies of France.

BOSNIA AND HERZEGOVINA, two provinces lying south of Hungary between Dalmatia and Servia, although nominally a part of the Ottoman empire, have been since the Treaty of Berlin (1878) occupied and administered by Austria-Hungary. The total area, including the sanjak of Novi-Bazar, which is occupied by an Austrian force, although under Turkish civil administration, is 23,571 square miles, and the population in 1895 was 1,568,092, of whom 673,246 belonged to the Orthodox Greek Church, 548,632 were Mohammedans, and 334,142 were Roman Catholics. The administration of the provinces is under the control of the Austro-Hungarian minister of finance, assisted by a local provincial government, having its seat at Sarajevo, a city of 38,083 inhabitants. The expenditure for the administration of the provinces in 1901 was estimated at 42,591,451 kronen, which did not include the cost of maintenance of the army of occupation, numbering 20,110 men. The revenue for the same year was estimated at 42,789,881 kronen. The krone is worth 40.6 cents.

About 88 per cent. of the inhabitants live by means of agriculture, which is still in a low state of development. The chief products are tobacco, which is a government monopoly; dried fruits, of which 20,000 tons, valued at £200,000 were exported in 1899; grain, goat and sheep skins, and minerals. The greater part of the skins exported went to Great Britain and the United States. The mines, mainly controlled by the government, produced in 1899 coal (303,425 tons), iron ore (67,085 tons), copper, and manganese. The provinces are included in the Austro-Hungarian customs territory, and there are no separate trade statistics. There are 555 miles of railway. Education is free but not compulsory. There are four gymnasia, nine commercial, and 235 elementary schools, and two training schools for teachers. The Greek and Roman Catholics each support theological seminaries, and the Mohammedans 854 lower schools and a college.

In May, 1901, the government provided for the construction of a railroad from Sarajevo, the capital, to the sanjak of Urak on one side, and the Servian frontier at Vardiste, on the other, the total cost to be about 75,000,000 kronen. In May a narrow-gauge railway 126 miles in length was opened from Gabela, in Herzegovina, to Castelnova, on the Bocche di Cattaro, with branches to Trebinje, on the Montenegrin frontier, and to Gravosa, a port in Dalmatia.

BOSTON PUBLIC LIBRARY, in Boston, Mass., consists of a central library on Copley Square, housed in one of the most beautiful buildings of its kind in the United States, and of 87 agencies, fifteen of which were established during 1901. These agencies include 11 branch libraries, 5 reading rooms, and numerous deposit and delivery stations in public schools, fire-engine houses, and reformatory institutions. The number of volumes in the library is 281,377, an increase during 1901 of more than 37,000, 7,000 of which were accessions by gifts representing more than 2,000 donors. The Boston Library has the largest circulation of books of any library in the United States, the total circulation for the year being 1,324,728, an increase of 73,187 over 1900. The most important additions in 1901 were made to the manuscript department. The Chamberlain collection of more than 30,000 pieces was received by bequest, and in addition several smaller collections relating to the early history of Boston and to the abolition movement. As a further means for interesting the public in the work of the library, the trustees established a course of lectures, inaugurated by Colonel T. W. Higginson. During the year the John

Eliot decorations were received by the library and made public. These decorations were provided for by gifts made in 1891. The remainder of the Edwin A. Abbey (*q.v.*) series on the "Search for the Holy Grail" have also been placed on public exhibition. These series of decorations are numbered among the most noted of American contributions to art.

BOTANICAL SOCIETY OF AMERICA, a national scientific society organized 1893 as an outgrowth of the Botanical Club of the American Association for the Advancement of Science. Its membership includes many of the best-known botanists of the country. Secretary, Professor George F. Atkinson, Cornell University, Ithaca, N. Y.

BOUTELLE, CHARLES ADDISON, congressman, died at Waverly, Mass., May 21, 1901. He was born at Damariscotta, Me., February 9, 1839, and was educated in the public schools and at the Yarmouth (Me.) Academy. At 15 he adopted his father's profession of shipmaster, following this until 1862, when he entered the United States navy. During his four years of service in the Civil War he took part in various engagements as an officer in the North and South Atlantic and West Gulf squadrons. He acquired control of the Bangor (Me.) *Whig and Courier* in 1874, became active in Republican State and national politics, and was elected to Congress in 1882. There he served continuously from that time until his death, being notably active in naval legislation, and largely responsible for the upbuilding of the iron-clad, modern American navy.

BOWDOIN COLLEGE, Brunswick, Me., founded 1794. In 1900-01 the college had a faculty of 35 and an attendance of 434, of which number 254 were in the academic department, and 91 in the medical department. The library contains 70,159 volumes, of which 2,913 were additions during the year. The most important changes during the year were the change from a three to a four years' course in the medical school; the introduction of a course in Spanish throughout the senior year; the recommendation by the president that the degrees of B.S. and B.L. be dropped, and that the one degree, B.A., be given for the four years' collegiate course, with or without Greek. Professor A. L. P. Dennis, Ph.D., of Harvard, takes the chair of history and political science, succeeding Professor William McDonald, who accepted a call to Brown University. Gifts amounting to \$30,000 were received during the year.

BOWLING. Two new records were made in 1901: the best average by teams of five in two consecutive games, by the Palace team of Columbus, O., 1,029; and the best similar average in three consecutive matches, by the Tosseti team, of Chicago, 1,006. The first American Bowling Congress championships were held in Chicago. The individual championship was won by Frank Brill, of Chicago, with 648 pins for 3 games; the two-men team championship by I. Voorhees and C. K. Starr, of New York, with 1,203 pins for 3 games; the five-men team championship by the Stanford team, of Chicago, with a total of 2,720 pins for 3 games.

BOXING. The contests for boxing (except prize-fights) are mainly those conducted under the auspices of the Amateur Athletic Union. In 1901 the following were the winners in the various weights: 105 pounds, I. Brown, Pittsburg; 115, George Young; 125, John L. Scholes, Don Rowing Club, of Toronto; 135, J. F. Mumford, New West Side Athletic Club, New York; 145, J. J. Dukelow, Rochester Athletic Club; 158 and also heavyweight, Wm. Rodenback, New West Side Athletic Club.

BOYLE, Sir COURTENAY, K.C.B., British financier, died in London, May 19, 1901. He was born in Jamaica, W. I., in 1845, and was educated at the old London Charterhouse School and at Christ Church, Oxford. He served as official private secretary to Lord Spencer, viceroy of Ireland, from 1868 to 1873, and in 1874 was appointed local government inspector for the eastern counties of Ireland, serving during the Phoenix Park murders and the Crimes Act of 1882. In 1886 Mr. Boyle was transferred to the Board of Trade in London, becoming permanent secretary in 1893. It was in the successful handling of transportation problems and the management of fisheries, harbors, lighthouses, etc., that his work was most valuable. At school he formed a close friendship with Thackeray during a visit of the latter, and maintained it until Thackeray's death.

BOYSSET, CHARLES, French legislator, died in Paris, May 23, 1901. He was born at Chalons-sur-Saône, April 29, 1817, and was educated for the law. First elected to the Chamber in 1871, M. Boysset served there continuously for almost thirty years, becoming dean of that body. Throughout his legislative career he was a member of various committees to prepare the annual budgets, in all of which he strove persistently to reduce the appropriations made to religious and theological organizations.

BRADBURY, JAMES WARE, ex-senator from Maine, died at Augusta, in his native State, January 6, 1901. He was born in York County, July 10, 1802, and grad-

uated at Bowdoin College in 1825. After teaching for a time he studied law and was admitted to the bar in 1831. He was in the Senate from 1847 to 1853 as a Democrat, during the excitement attendant upon the war with Mexico, and vigorously supported the policy of President Polk concerning the conflict. Senator Bradbury served on the judiciary and claims committees and a select committee on the French spoliation claims. A result of his work was the preparation by him of an amendment to a pending bill, which provided for the establishment of a permanent court of claims (instituted in 1855) to adjust claims of citizens against the United States. At the expiration of his term Senator Bradbury declined a renomination and retired to the practice of law.

BRAZIL, the largest republic in the world except the United States, occupies the central and eastern part of South America. The capital is Rio de Janeiro.

Area, Population, etc.—The total area of the twenty states and federal district comprising Brazil has been estimated at about 3,209,000 square miles, and later at 3,218,000 square miles. The population, which, according to the census of 1890 (the last taken), was 14,333,915, has more recently been estimated at about 17,500,000. The population of Rio de Janeiro (522,651 in 1890) was placed at 780,000 in 1899; it is not unlikely, however, that this estimate was too high. The number of foreigners in Brazil (1901) is reported at about 2,700,000. Of these 1,300,000 are Italians, 800,000 Portuguese, 300,000 Germans, 100,000 Spaniards, 80,000 Poles, 10,000 French, and 5,000 English. It is said that only one or two per cent. of these preserve their original nationality.

The prevailing religion is Roman Catholicism. Recent educational statistics are not available, but it is certain that general education, which is nowhere compulsory, is in a backward condition.

Government.—The chief executive is a president (Senhor M. F. de Campos Salles for the four-year term ending November, 1902), who is assisted by a cabinet not responsible to the Congress. The latter is the national legislative body and consists of a senate and a chamber of deputies, which convene annually on the 3d of May for four months. The several states enjoy local self-government.

Army and Navy.—In 1900 the regular army consisted of about 2,600 officers and 14,600 men. The navy comprises 2 third-class battleships, 2 second-class cruisers, 2 third-class cruisers, 3 torpedo cruisers, 8 first class torpedo boats, and a number of smaller or older craft.

Finances and Economic Conditions.—The monetary standard is gold and the unit of value the milreis, which is worth 54.6 cents in United States money. For some time previous to 1901 the paper milreis (par value 54.6 cents) had depreciated, falling to about 12 cents, but in that year, on account of the contraction of the currency, it rose to about 23 cents. The chief source of revenue is duties on imports; the principal items of expenditure are interest on the public debt and the maintenance of the departments of agriculture, war, and marine. The estimated revenue for 1900 was reported at 27,000,000 milreis gold and 281,000,000 currency; for 1901 the revenue was estimated at 58,869,741 milreis gold and 286,082,200 currency, and the expenditure 37,509,985 milreis gold and 244,514,194 milreis currency. In his report published in September, 1901, the minister of finance stated that the financial condition of the government had considerably improved.

A British consular report published in the summer of 1901 described the economic condition of the country as unsatisfactory. The measures taken by the government for the improvement of the public finance have laid heavy taxation on the people, while state and municipal taxation are equally burdensome. This increased taxation has come at a time of great local depreciation in the value of coffee, the chief national product. There were large stocks of coffee on hand in 1901, while the harvest for the year was abundant; the world's production for the year has been stated at 16½ million bags and the consumption at only 14½ millions. From these facts, together with a consideration of Brazil's fluctuating currency and the troublesome problems of wages and labor, the British consul concluded that a successful reconstruction of economic conditions could hardly be expected in the immediate future.

What appeared to be a somewhat more favorable view was held by the United States minister at Rio de Janeiro, who, under date of July 3, 1901, reported that specie payments on the foreign debt had been resumed after a lapse of three years; that Brazilian securities had risen from 45 per cent. to 75 per cent. of par; that the paper currency had been contracted from 788,000 contos (a conto is 1,000 milreis) to 689,000 contos; that the value of the milreis in United States money had risen from 11.25 cents to 23.03 cents; that 21,000 contos of treasury bills outstanding July 1, 1898, had been redeemed; that internal gold bonds amounting to \$12,166,250 had been paid off; and that important measures of retrenchment had been introduced in the administration. It must be noted, however, that the net gold debt had been increased by over \$24,330,000. The minister called attention

to the fact that importations had seriously declined and that internal taxes had been increased, and he pointed out that "the rise of the sterling value of the milreis had lowered the currency price of exports, and the contraction of the circulation had apparently had an influence in limiting commercial operations." But he added: "This period of stringency is already beginning to moderate, and the process of the adjustment of prices and credits to sounder currency values is proceeding normally. . . . It is clear that a continuation of the policy of the present administration will result in Brazil meeting promptly foreign obligations."

The debt of Brazil in the early part of 1901 is stated as follows: On January 1, 1901, the external funded debt amounted to £44,396,976 (\$216,057,884). This debt was renewed on July 1, 1901, and for its service £2,034,257 (\$9,899,712) were remitted to London. The internal funded floating debt (payable in gold), on March 31, 1901, was reported at 27,259,000 milreis (\$14,883,414); the amount payable in paper was 543,826,637 milreis (\$81,573,996, valuing the paper milreis at 15 cents). The floating debt, at the rate of 15 cents per paper milreis, amounted to \$24,836,603. The paper money in circulation amounted to 689,000,000 milreis. The total currency indebtedness of the republic was 1,398,403,972 milreis, or \$209,760,595, at 15 cents per paper milreis. The total debt accordingly (foreign and internal) was \$440,701,893. The total given above for the internal gold debt includes the $4\frac{1}{2}$ per cent. loan of 1879, amounting to 20,549,000 milreis, which is usually included in the foreign debt.

Industries and Commerce.—The principal industry is agriculture and the leading crop coffee. Other important products are rubber, sugar, tobacco, maize, yerba maté, cotton, cacao, beans, and nuts. Various minerals occur, including gold and diamonds. The estimated coffee crop of the year 1900-01 was 12,000,000 bags. During the year ending May 31, 1901, the coffee receipts at Santos and Rio de Janeiro, the two great coffee-shipping ports, aggregated 10,361,000 bags. Rubber is produced chiefly in the Amazon valley; the production from that region in 1900 was reported at 25,807 metric tons; the export in the same year amounted to 27,686 tons, of which 14,314 tons were sent to the United States and 12,435 to Europe. The annual sugar production is estimated at 250,000 tons; the sugar export in 1900 was about 31,000 tons.

The principal imports include cotton and woollen goods, iron and machinery, provisions and alcoholic liquors, cattle, and coal. Among the leading exports are coffee, rubber, cotton, tobacco, sugar, and cacao. Recent statistics for the total commerce are not available. In 1897 the imports and exports, exclusive of specie, were valued in currency at 671,603,280 milreis and 831,806,918 milreis respectively. Trade is carried on chiefly with Great Britain, the United States, Germany, and France (see the paragraph Finance and Economic Conditions). In 1900 there were 9,172 miles of railway in operation, the approximate cost of which was \$571,000,000.

The unfavorable economic conditions of Brazil have been attended by political troubles. In the latter part of March, 1901, an alleged plot to assassinate President Campos Salles and reestablish a monarchical government was discovered in Rio de Janeiro. Admiral Custodio de Mello and others were arrested for complicity in the plot. The opposition to the administration asserted that the whole affair was "a pretext for the prosecution of the president's personal enemies." In the summer of 1901 various high officials, including the minister of the interior, resigned and the political outlook was unfavorable. Popular discontent was caused by the depreciated value of coffee, due to overproduction, and the enhanced value of the paper currency, which increased the cost of labor and made taxation more burdensome.

It was reported about May 1 that Indians had attacked certain settlements in Maranhao and killed some 200 Christians, and in September an uprising occurred in Matto Grosso.

In the fall of 1901 it was announced that a German syndicate with a capital of 21,000,000 marks (\$4,760,000) had been organized for the purpose of founding German colonies in the States of Rio Grande, Sao Paulo, Santa Catharina, Minas Geraes, Goyaz, and Paraná; an Italian syndicate with a capital of 50,000,000 lire (\$9,650,000) proposed to establish Italian colonies in Brazil.

A treaty submitting the boundary dispute between Brazil and British Guiana to the arbitration of the king of Italy was signed in London, November 6, 1901, by the Brazilian minister, Senhor Joachim Nabuco, and Lord Lansdowne.

On September 20, 1901, the Republican convention held at Rio de Janeiro nominated for president of the republic Dr. Rodrigues Alves, governor of Sao Paulo and formerly minister of justice, and for vice-president Dr. Silviano Brandao, governor of Minas Geraes. These nominations implied the wish of the party to continue the policy of the outgoing administration. The presidential election was to take place in March, 1902.

BRETSCHNEIDER, DR. E., Russian sinologue, died in St. Petersburg, May 12, 1901, at an advanced age. For many years Dr. Bretschneider was physician to the Russian legation at Peking, and took advantage of the opportunity to investigate Chinese archaeology, history, language, and geography. He published volumes on: *The Study and Value of Chinese Botanical Works* (Fuchau, 1870); *Knowledge Possessed by the Ancient Chinese of the Arabs and Arabian Colonies and Other Western Countries Mentioned in Chinese Books* (London, 1871); *Notes on Chinese Mediæval Travellers to the West* (Shanghai, 1875); and *Mediæval Researches from Eastern Asiatic Sources* (London, 1883). To students of Oriental history Dr. Bretschneider's work has been of great value.

BREWER, MARK SPENCER, United States civil-service commissioner, died at Washington, March 18, 1901. He was born at Addison, Mich., October 22, 1837, and spent the first twenty years of his life on his father's farm. After an academic education he began the study of law in 1861, and three years later was admitted to the bar at Pontiac, in his native State. He was city attorney there, 1866-70, and was in the State senate, 1872-74. In 1877 he was sent to Congress as a Republican, and remained until 1881, when he became consul-general at Berlin. He was recalled by President Cleveland in 1885, and once more served in Congress, 1887-91, when he declined a renomination. In 1898 he was appointed a civil-service commissioner.

BRIDGE-BUILDING. The record of notable bridges completed and in process of construction during 1901 includes much that is of interest. In the United States the three great bridges across the East River, between Manhattan and Brooklyn, in New York City, stand foremost in size and importance. Of these three bridges, that known as the New East River Bridge is now well on toward completion, work having been begun on the suspension cables during the closing months of the year. The clear span of this bridge is 1,600 feet, and its total length is 7,200 feet. The Third Bridge is also a suspension bridge, and contracts for the Brooklyn tower foundations were let during the year. The principal dimensions of this structure are as follows: Total length between terminals, 9,335 feet; length of centre span, 1,465 feet; length of shore spans, each, 850 feet; width over all, 120 feet; height of towers to cable centre, 325 feet; clear height above water at centre, 135 feet; number of cables, 4; diameter of cables (approximate), 19 inches; capacity, 4 trolley tracks, 2 elevated railway tracks, 1 36-foot roadway, and 2 sidewalks. The Fourth Bridge, which crosses over Blackwell's Island, will be a cantilever structure, and the foundations and masonry work were contracted for during 1901. The following are the principal dimensions of this bridge: Length of Manhattan approach, 1,102½ feet; length of Manhattan anchor span, 469½ feet; length of west channel span, 1,131 feet; length of Blackwell's Island span, 630 feet; length of east channel span, 984 feet; length of Queens anchor span, 459 feet; length of Queens approach, 3,455 feet; total length, 8,231 feet; capacity, 2 sidewalks, 2 roadways, 4 trolley tracks, and 2 elevated railway tracks.

The only existing cantilever bridge having a span greater than the west channel span of the Fourth Bridge across the East River is the Forth Bridge across the Firth of Clyde in Scotland, which has two spans of 1,720 feet each. There is, however, a cantilever bridge under construction across the St. Lawrence River at Quebec, Canada, which will have a main span 1,800 feet long. During 1901 work was actively in progress on the substructure for this Canadian bridge, and the manufacture of the steelwork was begun. It is of interest to note in passing that the steelwork for this great structure will be built and erected by a United States concern. Another large Canadian bridge, which was put into operation in 1901, was the Royal Alexandra (Interprovincial) Bridge at Ottawa, Canada. This bridge has a main cantilever span of 1,049 feet 9 inches.

No new developments in connection with the long-projected bridges across the Hudson River at New York City were recorded during the year. Nothing further was heard during 1901 of the proposed long-span bridges across the Detroit River near Detroit, Mich., and across the Mississippi River at New Orleans, La. On July 24, 1901, the former Brooklyn Bridge, completed across the East River at New York City in 1884, suffered an accident which caused considerable popular excitement and apprehension, and which was widely discussed by engineers in an endeavor to determine its cause and significance. The accident was the breaking of nine of the steel suspender rods which suspend the north stiffening truss from the north cable. An investigation showed that two of these rods had been broken for some time, and that some of the others were partly fractured previous to the final break which called attention to the conditions. On September 14, 1901, two expert engineers who had been delegated by the district attorney to investigate the accident presented a report which criticised the original design of the bridge, arraigned the engineers in charge of its maintenance for carelessness, and suggested

NEW EAST RIVER (WILLIAMSBURG) BRIDGE.

improvements in order to do away with further danger. Exceptions to this report were taken by the engineers who designed the bridge and also by the engineers in charge of its maintenance, and many columns of the engineering papers were occupied with the technical discussions which followed. A rather notable step was taken by the city of Chicago during 1901, in its formal adoption of a plan to replace gradually the various railway and highway swing bridges across the Chicago River with bridges of the bascule type. Altogether there are about 50 swing bridges across this stream, and of these it was decided to replace 12 at once. Work was begun on several of these new structures during 1901.

Passing to the more remote possessions of the United States, we find that the events of the year record the construction of two steel bridges in Alaska and of a number of concrete-steel arch railway bridges in Porto Rico. The most notable of the two Alaskan bridges was a cantilever structure of 240 feet span on the White Pass and Yukon Railway, about 18 miles from Skagway. The second of the two Alaskan bridges was a 154-foot truss span across the Klondike River near Dawson City. The concrete-steel arch bridges erected in Porto Rico were excellent examples of this type of construction, but hardly call for particular mention.

It may be noted that concrete-steel types of bridge construction continued to receive favor among American engineers, and numerous arches of this construction were built for railway and highway purposes throughout the United States. Perhaps the most notable of these structures was the so-called Y Bridge at Zanesville, O., which was well on toward completion at the end of 1901. This bridge has eight concrete-steel arch spans—three of 88 feet, one of 99 feet, and four of 122 feet. A stone-arch bridge notable for its length was nearly completed during 1901 across the Susquehanna River at Rockville, Pa., on the Pennsylvania Railroad, and plans were prepared and contracts let for two similar structures at Trenton, N. J., and New Brunswick, N. J. The Rockville Bridge consists of 48 arches of 70-foot span, making, with the piers, a structure 3,820 feet long. The proposed Trenton Bridge had 18 arches of 60-foot span, and the New Brunswick Bridge 21 arches, one 72 feet, eight 51 feet, one 56 feet, and eleven 66 feet.

With regard to the bridge-building of foreign countries, space permits merely a mention of the more important new bridges and new bridge projects. In connection with the concession held by Germany for a railway to Bagdad and the Persian Gulf, a bridge across the Bosphorus at a point where it is only 1,700 feet wide was proposed early in January, 1901. A steel suspension bridge was proposed, high enough to permit the passage of vessels beneath. Its cost was estimated at \$15,000,000. In July, 1901, formal tenders were submitted to engineers for the design and construction of a bridge across Sydney Harbor, between Sydney and North Sydney, New South Wales. These tenders called for a design to have a clear headway of 170 feet, for 600 feet at the centre of the main span, and of not less than 150 feet for the remainder of the main span, which must be of such a length that the clear waterway between piers should be at least 1,200 feet. On July 10, 1901, the bridge over the Amou-Daria River in Russian Central Asia was opened for traffic. This is the largest bridge in the Russian empire, and replaces a timber trestle $1\frac{1}{2}$ miles long by which the Mid-Asiatic Railway previously crossed the river named. It consists of 25 spans of 210 feet each and two end spans of 35 feet each, carried on masonry piers. The total opening is 5,250 feet, or 30 feet less than a mile. An interesting feature of this structure is that the steelwork was constructed mostly by Russian firms. Early in December, 1901, engineers were invited to submit competitive designs for a bridge across the River Neva in St. Petersburg, Russia. This structure is to be 847 feet long and 91 feet wide, with a 98-foot draw-span. In December, 1901, a company made application to the Canadian government for a charter to build a railway and highway bridge across the Strait of Canso, Nova Scotia, with a main span of at least 1,000 feet. No very notable metal bridges were built or projected in Continental Europe during 1901, but several truly remarkable works in stone-work bridge construction belong to the records of the year. First of these is the enormous structure building at Luxemburg. This bridge crosses the valley of the Petrusse and will have an arch span of 84 meters, or 275½ feet, which is 55½ feet greater than any other arch span in the world. Besides being remarkable for its great size, this bridge is notable for its construction. It will consist of two parallel arches spaced 19.68 feet apart in the clear, with the intervening space spanned by slabs of concrete-steel material. The bridge, when completed, will cost about \$280,000. Two other European arch bridges, one of 210 feet span and the other of 187 feet span, are located on the Neustadt and Donaueschingen Railway in Germany. The longer bridge crosses the Gutach River and the shorter crosses the Schwaendeholz Brook. In Spain plans were made public for a three-hinged concrete-steel arch of 165 feet span over the River Nalon.

BRIGHT, WILLIAM, D.D., Anglican divine and ecclesiastical historian, died at Christ Church, Oxford, March 6, 1901. He was born at Doncaster December 14,

1824, and graduated with first classical honors at University College, Oxford, in 1846. After remaining there as fellow he took orders, being ordained priest in 1850, and in the following year became tutor in theology at Trinity College, Glenalmond. There he remained until 1859, when he returned to Oxford as tutor and in 1868 was appointed regius professor of ecclesiastical history and canon of Christ Church, the incumbency of which offices he retained until his death. Canon Bright was an active writer, and in addition to his historical productions which are authoritative, wrote many poems, hymns, and theological treatises. Among his works are, *A History of the Church, from the Edict of Milan to the Council of Chalcedon* (1860); *Hymns and other Verses* (1866); *Waymarks in Church History* (1894); and *Some Aspects of Primitive Church Life* (1898); and editions of Eusebius' *Ecclesiastical History* (1872); Athanasius' *Orations Against the Arians* (1873); and Socrates' *Ecclesiastical History* (1878).

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE, founded 1831, held its annual meeting at Glasgow, September 11, 1901, and following days. President Arthur W. Rücker, in his opening address, discussed in detail the atomic theory and the doubts recently expressed as to its value. He contended that the atomic theory unifies so many facts and simplifies so much that is complicated that we have a right to accept it until an equally intelligible rival hypothesis is produced. In section A, Mathematics and Physics, President P. A. McMahon, D.Sc., F.R.S., reviewed the progress made in mathematical science during the past century and pointed out the true function of the specialist. Lord Kelvin also lectured on the actual amount of gravitational matter in any large volume of interstellar space. The position of British chemistry at the beginning of the twentieth century was the subject of Professor Percy Frankland's address in section B, Chemistry. In section C, Geology, the recent advances in Scottish geology furnished the inspiration for a very interesting paper by President J. Horne, while Professor Cossar Ewart discussed in section D, Zoology, the experimental study of variation. In section E, Geography, Dr. H. R. Mill delivered an address in which he outlined the sphere of the science, dwelling on its theoretical and practical importance. In connection with the subject of acquiring material for a complete geographical description of the British Isles, Dr. Mill stated that a bathymetrical survey of the fresh-water lakes in the United Kingdom was about to be undertaken by private enterprise. In section F, Economic Science and Statistics, Sir Robert Giffen, the president, discussed the subject of *The Importance of General Statistical Ideas*, and a paper which aroused considerable interest was one read by Mr. Edward Canan on *The Decline of Natality in Great Britain*. The main points emphasized were, that the decline of natality was not due to the lack of marriages, but to the falling off in the size of families and the tendency to sterility, which was becoming so marked a feature of married life not alone in Great Britain but in other countries. France, it was claimed, was the grand modern example of the "sterile family," but it was claimed by one of the participants in the discussion that the United States and Canada were a close second to France in the latter part of the nineteenth century. In the course of the debate comparative reference was made to Greece and Rome, as well as to some of the modern nations, and the view was expressed, but dissented from by the president, that "the decay of religious belief appeared as the one common antecedent to the decline of the birth-rate." In section G, Mechanical Science, Colonel R. E. Compton dealt with the subject of modern development of passenger and goods traffic, and in section H, Anthropology, Professor D. J. Cunningham, of Trinity College, Dublin, discoursed on the human brain and its part in the evolution of man. Professor McKendrick, of Glasgow University, in section I, Physiology, discussed some of the problems of molecular physiology, and in section K, Botany, Professor Bayley Balfour devoted his attention to the technical subject of *Angiosperms*. A new and important section, section L, Education, was for the first time represented at the meeting of the Association, and many of the leading educators of the country were in attendance. The address of the president, Sir John Gorst, dealt with the important question of the proper function of national authority in the education of the people. A joint discussion was later held by the Education Department with the Mathematical Department of section A, on the teaching of mathematics. Economics and commercial education and educational methods generally furnished inspiration for part of the discussion. There were many interesting papers read, apart from those representing the special departments, and embracing a variety of purely technical matter. In the section of Economic Science (F) papers were read and discussed relating to shipping subsidies, British export trade, progressive taxation, land tenure and British agriculture. The "housing" question was also treated by Professor W. Smart. A popular lecture was delivered by Professor W. Ramsay on the inert constituents of the atmosphere; a paper read by Major Ross, in connection with section D, Zoology, on *The Story of Malaria*, with lantern illustrations, and an important contribution to the work of section L, Education, was made by the

Bishop of Hereford in a paper on the influences of universities and examining bodies upon the curriculum of secondary schools. At the general committee meeting, in accordance with custom, resolutions were passed in relation to the next meeting, which is to be held in Belfast in 1902 under the presidency of Professor Dewar.

BRITISH CENTRAL AFRICA, a name applied to a large territory in southern central Africa, which, with the exception of the British Central Africa Protectorate, is administered by the British South Africa Company, under the name of Northern Rhodesia. See the following article, RHODESIA, and CAPE-TO-CAIRO RAILWAY.

BRITISH CENTRAL AFRICA PROTECTORATE, formerly known as Nyassaland, lies between Lake Nyassa and Northern Rhodesia. Its estimated area is 42,217 square miles and its estimated population in 1900 about 900,000, of whom only some 400 were Europeans. The largest town is Blantyre, with about 6,000 inhabitants. The protectorate is administered by a commissioner, Mr. Alfred Sharpe in 1901, whose headquarters are at Zomba.

The chief interests are planting, mainly coffee, and the transportation of goods to and beyond the protectorate. Labor is scarce and the coffee industry has suffered, since many laborers engaged therein have turned to the work of transportation. The value of the imports in the year ending March 31, 1901, was £146,043 as against £176,034 in the preceding year, while the exports in the two years amounted to £38,723 and £79,349 respectively, the decline being almost wholly in the coffee exports. Goods in transit, however, increased from £31,337 to £51,333. A railway is projected to connect Blantyre with Chiromo.

BRITISH COLUMBIA, a province of the Dominion of Canada, with an area of 383,300 square miles. Its population, according to the census of 1901, was 178,657, as against 98,173 in 1891, showing an increase of over 81 per cent., the largest increase in the dominion, with the exception of the Northwest Territories. The capital is Victoria, with a population of 20,821 in 1901, against 3,980 in 1891. The province has a free undenominational school system supported entirely by the government. In 1900 it had 246 common schools, with 7,165 pupils enrolled; 48 graded schools, with an enrolment of 13,813; and four high schools, with 553 pupils. The expenditure on education for 1900 was \$307,479, against \$336,016 in the preceding year.

Government and Finances.—British Columbia is administered by a lieutenant-governor and a responsible ministry. It has only one chamber (legislative assembly) of 38 members elected by manhood suffrage. In the Dominion Senate and House of Commons the province is represented by three and six members respectively. The finances of the province have improved, although the revenue still falls short of the expenditures. For the fiscal year 1900 the receipts amounted to \$1,544,108, including \$242,689 received from the Dominion government, \$104,304 general mining receipts, \$133,766 receipts for "free miners' certificates, and \$188,214 tax on real estate. The expenditures for the same year amounted to \$1,831,205 as compared with \$2,156,474 for the preceding year. The chief items of expenditure for 1900 were interest on the public debt, \$243,637; civil government, \$172,577; public work, \$323,329; and sinking funds, \$106,207. The gross debt increased during 1900 from \$8,243,083 to \$8,866,868, and the assets from \$2,762,835 to \$3,098,304.

Industries.—Mining, the principal industry of the province, showed considerable progress during 1900. The total value of the mineral output for that fiscal year was \$16,344,751 against \$12,393,131 for 1899 and \$10,906,861 for 1898. The chief minerals produced in 1900 were gold, \$4,732,105; silver, \$2,309,200; lead, \$2,691,887; copper, \$1,615,289; coal, \$4,318,785; and coke, \$425,745. Next to the mines, the fisheries are the largest source of the wealth of the province. British Columbia ranks second among the provinces of the Dominion in fisheries' production, Nova Scotia occupying the first place. The total catch for 1899 (the latest year for which official statistics are available) was valued at \$5,214,074, showing a large increase over the preceding year, when it amounted to \$3,713,101, but still falling short of the catch of 1897, valued at \$6,138,865. The salmon pack for 1899 amounted to \$4,007,396 against \$2,661,830 for the preceding year. The value of the product of fisheries exported from British Columbia in 1900 was \$3,443,037, as compared with \$2,740,100 in 1899. Preliminary figures give the value of the catch for 1900 as \$6,787,756.

Commerce, Banks, etc.—The trade of British Columbia for 1900 was the largest in the history of the province. The exports amounted to \$17,843,906, against \$14,748,025 in 1899, and were composed as follows: products of mines, \$11,946,815; products of fisheries, \$3,442,997; forest products, \$710,883; manufactures, \$445,884; and animals and their produce, \$484,027. The imports amounted to \$11,255,679 against \$8,687,221 in 1899. Of the imports, goods to the value of \$5,753,424 were produce of the United States. There were in the province in 1900, 47 chartered banks and branches and 44 post office savings banks, with 3,676 depositors and deposits amounting to \$1,068,020. The only government savings bank of the province had in the same year 3,417 depositors and deposits amounting to \$1,158,900. The clearings of

the two clearing houses established at Victoria and Vancouver in 1899 amounted to \$32,038,700 and \$46,161,432 respectively. The railway mileage of British Columbia at the end of the fiscal year 1900 was 1,307, as against 1,129 in 1899. (See below.) The telegraph offices numbered 30 in the same year and the total length of the lines was 691 miles, against 567 miles in 1899.

History.—Early in 1901 provincial legislation on the lines of the Natal Asiatics Immigration Law came into operation and resulted in the rejection of a number of Japanese immigrants. Chinese, whose prescriptions of entry were provided for by Dominion legislation, were enabled to evade the act. The provincial legislature was asked but failed to remove the restrictions, and the Dominion government was compelled to veto the obnoxious act. Considerable trouble was experienced on the Fraser River, the white fishermen refusing to work owing to the employment of Japanese fishermen by the canning firms. The Japanese were armed for eventualities and the provincial police patroled the river. The strike was settled by the whites' accepting the canners' proposals. The British Columbia government introduced a bill providing for the issue of a loan of \$5,000,000 for railway subsidies and other public works of government ownership. The projected railway lines consist (1) of one from the coast to Kootenay, 300 miles, with a connection to Vancouver and New Westminster and by railway and ferry to Vancouver Island and Victoria; (2) the extension of the island railway to the north for 240 miles; (3) a line to connect Rock Creek with Vernon and the Canadian Pacific railway, 125 miles; (4) a line from Kitimat on the north mainland coast to Hazelton, 100 miles; and (5) a line from Fort Steele, on the Kootenay, to Golden, 150 miles. The bonus limit per mile was placed at \$5,000; \$500,000 was provided for a bridge over the Fraser River at Westminster. The province is to receive four per cent. of the gross earnings of the railways. The reorganization of a provincial cabinet took place in August. Mr. John C. Brown became provincial secretary, replacing Mr. J. D. Prentice, who was appointed finance minister in succession to Mr. Turner, who proceeded to London as agent-general.

BRITISH EAST AFRICA. See EAST AFRICA, BRITISH.

BRITISH GUIANA, a colony of Great Britain on the northeastern coast of South America, has an estimated area of 120,000 square miles and an estimated population, at the beginning of 1900, of 287,288. The capital is Georgetown. The colony is administered by a governor (Sir Walter J. Sendall, since 1898), who is assisted by an executive council and, for legislative purposes, by committees (courts) of appointed and elected members. Revenue is derived chiefly from customs. For the fiscal year 1899 the revenue and expenditure amounted to £525,865 and £525,387 respectively; for 1900 £538,838 and £525,542 respectively. At the end of the latter year the public debt, including all local loans for which the colonial revenue is security, stood at £958,840. For the fiscal year 1899 the imports and exports were valued at £1,371,412 and £1,775,691; for 1900, the imports, which were mainly flour, rice, cotton, and woolen goods, were valued at £1,318,701, and the exports, of which seven-eighths were made up of sugar, gold, and rum, at £1,927,959. In the latter year over half the imports came from Great Britain and over a quarter from the United States; while the exports were divided almost equally between the same countries. Of the total trade 52.9 per cent. was with Great Britain, 38.9 per cent. with the United States, and 5.9 per cent with British possessions. Gold production in 1900 was 112,789 ounces. There are about 75 miles of railway. In February, 1901, an electric tramway of some ten miles in length was opened in Georgetown. In February, 1901, the governor stated that, although the revenue remained stationary, there would be a favorable balance at the end of the fiscal year, "testifying to the most rigid economy of administration," and he noted a reduction in the public debt. There was promise, he said, of important developments in agriculture, especially the cultivation of sugar and ballata, in the diamond industry, and in gold mining. The final adjustment of the boundary dispute with Venezuela should lead to the investment of new capital in the gold district; and the most effective method for the general development of the interior, that is, the construction of railroads, was planned.

During the year the British press gave considerable attention to the great possibilities of development in British Guiana. Of the small population about 90 per cent. is confined to a strip along the coast, some 200 miles in length and rarely extending more than 30 miles inland, "so that nine-tenths of the population are congregated in about one-hundredth part of the territory." More than one-third of the inhabitants are East Indian immigrants or their descendants. Since labor is insufficient even in the more thickly settled districts, it is clear that the local resources of the colony are inadequate for any considerable development of the hinterland.

BRITISH HONDURAS, or BELIZE, a crown colony of Great Britain on the Caribbean Sea, directly south of the Mexican state of Yucatan and east of Guatemala, comprises 7,562 square miles and has a population, according to the census of

1901, of 37,479. Its capital and chief town is Belize, with a population of 9,113. The colony is administered by a governor (Sir David Wilson since 1897), who is assisted by executive and legislative councils. The revenue increased from \$250,458 in 1899 to \$289,728 in 1900, and the expenditure decreased from \$262,415 to \$246,201. The dollar is the gold dollar of the United States, which was adopted as the standard unit of value in 1894. There is a paper currency (1899) of \$100,704 and a subsidiary silver currency of \$200,000 in circulation. The public debt is \$168,815. The imports, two-thirds of which are furnished by the United States, amounted to \$1,031,473 in 1899 and \$1,198,772 in 1900. The exports increased from \$1,018,044 in 1899 to \$1,300,565 in 1900, the value of the exports to Great Britain falling in the same period from \$860,378 to \$613,565. The staple products are woods, principally mahogany and log-wood. The export of mahogany, the value of which is \$40 to \$50 per 1,000 feet, amounted to 7,994,378 feet in 1901. The colonial secretary in his last annual report called attention to the fact of the poor quality of the mahogany exported, which seemed to indicate a failure in the supply of the real Honduras mahogany; the only remedy, he thought, would be improved methods of transportation, which would make it possible to tap the forests remote from the coast. Sugar and fruits are also exported. About 15,000 acres are under cultivation. Gold and silver occur, but have never been worked. On February 1, 1901, a new tariff went into effect which provided for a considerable reduction in duties.

BRITISH NORTH BORNEO. See BORNEO.

BROCK, THOMAS, R.A., the British sculptor who was selected in 1901 to execute the memorial statue of Queen Victoria, was born at Worcester, England, in 1847, the son of a decorator in that city. He was educated first in the government School of Design at Worcester, then at the Royal Academy, London, where he won both a silver and a gold medal. After studying under J. H. Foley, the sculptor, he became his assistant, and upon Foley's death completed a number of the latter's unfinished works, including the O'Connell monument at Dublin. Among Mr. Brock's ideal creations are included "Salmacis," "Hercules Strangling Antaeus," an equestrian group; "A Moment of Peril," and statuettes of "Paris" and "Enone." His "The Genius of Poetry" was exhibited at the Royal Academy in 1889. He has executed portrait statues of Richard Baxter, Sir Rowland Hill, Henry Wadsworth Longfellow (for Westminster Abbey), Sir Richard Owen, Lord Derby, and others. In 1898 five of his sculptures were placed in the National Gallery of British Art, among them a statue of "Eve."

BROGDEN, CURTIS HOOKS, ex-governor of North Carolina, died January 4, 1901. He was born on a farm in Wayne County, N. C., December 6, 1816, and spent his youth there. From 1838 to 1857 he was in either the senate or the assembly of the State, and later was State comptroller, 1857-67, presidential elector, 1869, and collector of internal revenues, 1870. In 1872 he was elected lieutenant-governor, and upon the death of his chief in 1874, conducted the administration for the remainder of the term. He was a Republican member of Congress from 1877 to 1879. Governor Brogden was active in the State militia and attained the rank of major-general.

BROGLIE, JACQUES VICTOR ALBERT, Duc de, French statesman and historian, died in Paris January 19, 1901. He was born in that city June 13, 1821, and was educated at the University of Paris. In 1871 he was elected to the Chamber of Deputies and in the same year went to London as ambassador. While in the Chamber he organized a coalition of the monarchical parties, which caused the resignation of President Thiers (1873), and the election of Marshal MacMahon as his successor. As premier in the new cabinet, Broglie incurred the enmity of a part of the monarchists, who united with the conservatives to secure his downfall. He resigned May 16, 1874, with his colleagues, but two years later was elected to the Senate and became leader of the reactionary parties (1877). A new cabinet was formed (May), in which Broglie was premier and minister of justice. At the ensuing election (November), which was bitterly contested, the Republicans were victorious, and Broglie, thus defeated, made no further attempt to exercise leadership, retiring from the Senate to private life in 1885. While notable as a statesman, M. de Broglie achieved more as a publicist and historian. As an undergraduate he published articles in the *Revue des Deux Mondes* and *Le Correspondant*, which were afterward collected under the title *Etudes morales et littéraires* (1853). Other works were *Questions de religion et d'histoire* (1860); *Le secret du roi: Correspondance secrète de Louis XV. avec ses agents diplomatiques, 1752-54* (1878); *Marie Thérèse impératrice* (1888); *Histoire et Diplomatie* (1889); and *Mémoires du prince de Talleyrand* (1891). He devoted much of his writing to defending the temporal power of the Pope, and constitutional liberalism in politics. He became a member of the Académie Française in 1862, and succeeded to his title on the death of his father in 1871.

BROOKLYN INSTITUTE OF ARTS AND SCIENCES was organized in 1824, and has twenty-eight departments, viz.: Archæology, Architecture, Astronomy, Biology, Botany, Chemistry, Domestic Science, Electricity, Engineering, Entomology, Fine Arts, Geography, Geology, Law, Mathematics, Microscopy, Mineralogy, Music, Painting, Pedagogy, Philately, Philology, Philosophy, Photography, Physics, Political Science, Psychology, and Zoology. Courses of lectures in the arts and sciences are delivered through the year; monthly meetings of each of the departments are held regularly, and concerts and dramatic readings are given at stated periods. The institute, under authority from the legislature, commenced the erection of a museum building on ground leased from the old city of Brooklyn for a term of one hundred years. The first section was opened to the public June 2, 1897. The second section, authorized by the Board of Estimate under legislative authority, was commenced in 1899, and will, it is expected, be completed in 1902. The museum is open daily from 9 A.M. to 6 P.M.; on Thursday and Friday evenings, from 7.30 to 9.15, and on Sundays from 2 to 6 P.M. A children's museum, as an auxiliary to the main museum, is also provided, and there is a laboratory for biological research located at Cold Spring Harbor, L. I. President of board of trustees, A. Augustus Healy; treasurer, W. B. Davenport; secretary, George C. Brackett. Office, 502 Fulton Street, Brooklyn Borough, New York City.

BROSIUS, MARRIOTT, American lawyer and congressman, died at Lancaster, Pa., March 3, 1901. He was born at Colerain, Pa., March 7, 1843, and received a country school education. At the outbreak of the Civil War he joined the 97th Pennsylvania Infantry, and served until he was wounded in 1863. At the close of the war he studied for a time at the Millville, Pa., Normal School, and afterward studied law at the University of Michigan, graduating in 1868. He commenced to practice at Lancaster, and was elected to Congress as a Republican from that district, in 1890. He served there until his death, and during 1895-97 was chairman of the committee on reform in the Civil Service. As chairman of the committee on banking and currency during 1899-1901, he was officially responsible for the form of the present gold-standard law.

BROTHERHOOD OF ANDREW AND PHILIP. See **ANDREW AND PHILIP, BROTHERHOOD OF.**

BROTHERHOOD OF ST. ANDREW. See **ST. ANDREW, BROTHERHOOD OF.**

BROWN UNIVERSITY, Providence, R. I., founded in 1764, had in 1901 a faculty of 87 and a student body of 899. This is an increase over the previous year of 10 members of the faculty and 27 in the student body. Of the students, 77 were graduate students and 177 were students in the Woman's College. The most important event of the year in a material way was the continued success of the movement to increase the endowment fund. During the year there was a cash increase of productive funds of \$576,780, and subscriptions and non-productive gifts completed the desired increase of \$2,000,000. In this sum is included the most valuable gift of all, the John Carter Brown Library, together with \$500,000 for maintenance, and \$150,000 for the erection of a library building, given by Mr. John Nicholas Brown. The John Carter Brown Library is one of the most extensive and probably the most valuable collection of Americana in existence. Its collection had been the work of a century and its contents have been used by all the great writers of American history and by many foreign governments both in Europe and in South America. The material equipment of the University has also been increased by the completion of the memorial gates, the administration building, the president's house, and the chemical laboratory. While at present the University buildings are characterized by the heterogeneousness, common to most of the large colleges in the east, due to their erection without reference to a general scheme of development, a general plan for the location and the architecture of future additions to the plant has been adopted.

The year was also marked by a great number of changes in the faculty. Professor William McDonald, of Bowdoin College, replaced Professor John Franklin Jameson, called to the University of Chicago, in the chair of history. Other appointments were Dr. Albert D. Mead to head professorship in biology, Professor H. F. Fowler to the professorship in Biblical literature, Professor J. E. Bucher, Jr., to a professorship in organic chemistry, Thomas Crosby, Jr., to a professorship in English and public speaking, and a number of appointments to instructorships. The educational policy of the institution shows development along the lines marked out in 1900; there is a general raising of standards for admission, but at the same time a withdrawal of Greek as a required subject for admission, its place being taken by the modern languages. A most important and significant change was the agreement entered into between the University and the city of Providence in regard to the public school system. By the terms of this agreement, the professor of education of the University becomes the "director of the training department" of the public schools, and is given general charge of all student teachers; a certain number of graduate students are

given positions in the High School under the direction of supervising teachers selected from the regular teaching staff of the High School, and are to receive a salary of \$400; a larger class of student teachers are to do observation and practice work of a more limited character without remuneration; students who have pursued the education courses are eligible to similar position in the grammar and elementary schools; a limited number of seniors in the department of education in the University are also allowed to teach and observe in the grammar schools. This solution is one of the best that has been offered for the vexed problems of combining the professional and the liberal training of the teaching profession, and its results will be observed by other universities with the greatest interest.

BROWNE, Sir SAMUEL JAMES, British general, died in the Isle of Wight, March 14, 1901. He was born in India, October 3, 1824, and entered the army there in 1840, receiving a commission four years later. For forty years he was in active service, and distinguished himself in the second Sikh War, 1848-49, the Sepoy Mutiny, 1857-59, during which he lost an arm, and the campaign against Shere Ali, Ameer of Afghanistan, 1878. He was frequently mentioned in despatches for bravery, received the Victoria Cross, and was made a Grand Commander of the Bath and a Knight Commander of the Star of India for distinguished services.

BROZIK, WENCESLAS, Bohemian painter, died in Paris, April 15, 1901. He was born near Pilsen, Bohemia, in 1851, studied at *l'Ecole des beaux-arts* of Prague, and in the Academy at Munich, and in 1876 went to Paris. He first exhibited at the Salon of 1877, showing two large canvasses illustrative of Bohemian history, "The Departure of Dagmar, Daughter of the King of Bohemia, Betrothed of Valdemar, King of Denmark (1205)," and "Episodes of the Wars with the Hussites (1419)." Among other historical paintings, he exhibited in 1878, "Ambassadors of the Dead King Ladislas to the Court of Henry VII," which was acquired by the National Gallery of Berlin. Turning to portraiture in 1880, he exhibited the "Portrait of M. G., General in the Chinese Army." M. Brozik was decorated by the Legion of Honor in 1894. His work is remarkable for clearness of accessory detail, and careful costuming.

BRUNEL. See BORNEO.

BRYN MAWR COLLEGE, Bryn Mawr, Pa., near Philadelphia, a leading woman's college, was opened in 1885. During 1901 the combined enrollment of the undergraduate and graduate schools was 417. The college has a faculty of 40 members, who give their whole time to instruction, in addition to two non-resident professors and ten academic officers. It has a library of about 36,000 volumes, and a plant valued at about \$1,000,000, including a campus of 52 acres of ground. Most of the students are housed in the dormitories, and one of the great needs of the institution is for more buildings of this character. The most important event of 1901 was the conditional gift of \$250,000, made by Mr. John D. Rockefeller, for supplying the needs of certain new buildings. The condition is that a similar amount be subscribed by other friends of the institution before the end of the collegiate year in June, 1902. Many conditional subscriptions were made during 1901, and at the close of the year every effort was being put forth to comply with the conditions of the gift.

BUBONIC PLAGUE. See PLAGUE.

BUCHANAN, ROBERT WILLIAMS, English novelist, poet, and playwright, died at Streatham, England, June 9, 1901. He was born in Glasgow, Scotland, August 18, 1841, and was educated at the Glasgow Academy, High School, and University. Going to London from the university (1860) he published his first collection of verses, *Undertones*, in 1863. Other volumes that fixed his place as a poet are *London Poems* (1866); *Napoleon Fallen*, a lyric drama (1871); *Ballads of Life, Love, and Humor* (1882); and *The City of Dream* (1888). Mr. Buchanan published a number of novels, including *St. Abe and His Seven Wives* (1872); *The Shadow of the Sword* (1876); *God and the Man* (1881); and *The Master of the Mine* (1885). In 1880 he began to write plays, making his greatest success with *Sophia*, an adaptation from *Tom Jones*. He also wrote critical essays, and in 1871, published in the *Contemporary Review* under the pseudonym of "Thomas Maitland," *The Fleshly School of Poetry*, a diatribe attacking what he called the sensuousness of the poems of Dante G. Rossetti and Swinburne. Replies from the attacked, under the titles of *The Stealthy School of Criticism* and *Under the Microscope*, respectively, marked a controversy in letters that will preserve Buchanan's name as effectively as any of his own works. Convinced of the injustice he had done, he retracted much of his charge, and dedicated his *God and the Man* to Rossetti. It was Buchanan's diffusion of energy, perhaps, that prevented his achievement of marked success in any of the lines he followed; each showed promise that was never fulfilled. Business reverses left him toward the close of his life with very straitened means. He visited this country in 1884-85.

BUCKWHEAT. The production of buckwheat in the United States has been small for the past 30 years, as compared with the 4 years immediately succeeding the Civil War. The acreage, which was 1,028,693 acres in 1869, fell to 536,992 in 1870, and the largest since then was 917,915 acres in 1886. The preliminary estimates for 1901, which are the only data available, indicated an increase of about 43,000 acres over the preceding year, or a total of about 681,000 acres. There was an increase in New York and Pennsylvania (which together contain about 76 per cent. of the total acreage of this crop) of about 58,000 acres, while the majority of other buckwheat-producing States reported diminished acreage. The preliminary estimates of the average yields an acre by States in 1901 were as follows: Maine, 31.7 bushels; New Hampshire, 21.0; Vermont, 25.1; Massachusetts, 18.9; Connecticut, 18.0; New York, 18.8; New Jersey, 19.0; Pennsylvania, 19.5; Delaware, 17.8; Maryland, 17.5; Virginia, 15.9; North Carolina, 15.6; Tennessee, 14.2; West Virginia, 26; Ohio, 16.1; Michigan, 14.1; Indiana, 13.1; Illinois, 11.0; Wisconsin, 12.4; Minnesota, 14.5; Iowa, 13.5; Missouri, 6.0; Nebraska, 11.5; and Oregon, 11.7. The average yield for the United States was 18.9 bushels an acre, as compared with 15 bushels in 1900, and 16.9 bushels for the past 10 years. Of the six States having 10,000 acres or upwards (i. e., Maine, New York, Pennsylvania, West Virginia, Michigan, and Wisconsin) four reported a yield an acre in excess of their average for 10 years. The quality of the 1901 crop was rated as 93.3 per cent. as compared with 90.2 for 1900. The total production in Ontario, Canada, was 1,759,071 imperial bushels, a decrease of over 6 per cent. in comparison with the previous year.

The exports of buckwheat from the United States since 1897 have been nearly a million and a half bushels annually, but in 1900 the amount declined to 426,822 bushels, valued at \$254,847, and in 1901 there was a further reduction to 123,540 bushels, valued at \$79,120. The buckwheat exported in 1901 was sent chiefly to the Netherlands, the shipments to that country amounting to 106,794 bushels, valued at \$68,565. Germany, which received the next largest shipments, took only 10,437 bushels, valued at \$6,666. No importations of buckwheat into the United States have been reported in recent years. Buckwheat middlings and bran, by-products in the manufacture of buckwheat flour, are coming into rather general use for feeding in the regions where they are produced. The middlings are fed to cows usually, and have been found to have a high feeding value. The bran consists of a mixture of the middlings and hulls, and as the latter are practically useless the bran, although a fair feed, is inferior to the middlings.

BUILDING STONES. The value of the building stone produced in the United States in 1899 and 1900 was as follows:

	1900.	1899.		1900.	1899.
Granite	\$10,969,417	\$10,343,298	Bluestone	\$1,198,519	\$815,284
Marble	4,267,253	4,011,681	Limestone	20,354,019	18,757,963
Trap	1,706,200	1,275,041			
Slate	4,240,466	3,962,733			
Sandstone	5,272,865	4,924,670		\$48,008,739	\$44,090,670

This shows a gain of \$3,918,069 over 1899. Massachusetts was the largest producer of granite, Vermont of marble, Pennsylvania of slate and limestone, Ohio of sandstone, and New York of bluestone.

BULGARIA. An autonomous Balkan principality under the suzerainty of Turkey. The capital is Sofia.

Area and Population.—The estimated area of Bulgaria proper is 24,380 square miles, and of the incorporated state of Eastern Roumelia, 13,700 square miles. The total population on January 1, 1893, was 3,310,713, and on March 31, 1900, 3,733,189. The national religion is the Orthodox Greek, but since 1870 the Bulgarian Church has not been included in the Orthodox communion. In 1899 there were 4,589 elementary schools with 345,887 pupils. There are also a number of schools for secondary instruction, and at Sofia a university with 409 students in 1900.

Government and Finance.—The chief executive authority is a prince (Ferdinand I., son of the late Prince Augustus of Saxe-Coburg and Gotha, since August, 1887), who is assisted by a cabinet nominated by himself and responsible to the Sobranje. In this body, a single chamber, is vested the legislative power. The strength of the army on a war footing is placed at 209,000 men. The navy is inconsiderable. The unit of value is the lev, worth one franc, or 19.3 cents. The largest item of revenue is direct taxes; the heaviest expenditures are for service of the debt and war. The estimated revenue and expenditure for 1899 were 84,097,105 leva and 84,035,514 leva, respectively; for 1900, 83,827,863 leva and 83,270,370 leva; for 1901, 95,286,000 leva and 95,350,000 leva. In 1899 steps were taken toward converting the entire national debt into a new 5 per cent. loan of 260,000,000 leva.

Industries, Commerce, etc.—Agriculture is the most important industry, and wheat the chief product. Other important products are wine, silk, tobacco, and attar of roses. Manufactures include various textiles, tobacco goods, and alcoholic liquors. In 1900 the amount of attar of roses distilled was about 4,360,000 grammes, an increase of 50 per cent. over the production of 1899. The principal export is wheat, and the leading imports textiles and metal goods. The imports and exports in 1898 amounted to 72,730,250 leva and 66,537,007 leva respectively; in 1899, imports 60,178,079 leva, and exports 53,467,099 leva. According to a British report Austria-Hungary stood first in 1900 in the import trade with £505,655, Great Britain second, and Germany third with £224,599. British trade is declining; imports from Great Britain fell from £498,000 in 1899 to £301,150 in 1900, and the former figure was smaller than that for 1898. About 40 per cent. of the exports go to Turkey; the countries next in order in the export trade are Great Britain, France, and Austria-Hungary. In 1900 there were 909 miles of railway in operation and 130 under construction. The state telegraph lines had a total length of 3,270 miles in 1899, and the state telephone lines 1,228 miles.

Events of 1901.—The resignation of M. Ivanschoff's cabinet was accepted in January, 1901, and a provisional cabinet for the transaction of public business until after the elections to the Sobranje was formed by M. Petroff, a former minister of the interior. On February 20 the elections took place, with the following results: Stambuloffists, 38; Zankoffists (Russophil), 32; Karaveloffists, 26; Stoiloffists, 24; Agrarians, 14; Independents (the Petroff party), 14; Turks, 9; followers of Radoslavoff (whose ministry resigned December 5, 1900), 6; Socialists, 4. On February 26 the Petroff cabinet resigned, and on March 4 Prince Ferdinand, upon the coalition of the followers of M. Zankoff and M. Karaveloff, sanctioned a new ministry of the following composition: M. Karaveloff, premier and minister of finance; M. Daneff, foreign affairs; M. Sarafoff, the interior; General Paprikoff, war; M. Radeff, justice; M. Ludskanoff, commerce; M. Slaveikoff, education; M. Belinoff, public works. M. Petko Karaveloff, who returned to power after an interval of fifteen years, was premier at the time of Prince Alexander's abduction. Subsequently he became a member of the Regency of Three, over which Stambuloff presided, but, quitting the Regency, he was soon imprisoned; and he was again imprisoned after the assassination of M. Beltcheff, but was liberated after the fall of Stambuloff. The extreme democratic and socialistic opinions of M. Karaveloff, who for a number of years has endeavored to regain political prestige, have been widely accepted in the rural districts of Bulgaria. The Sobranje convened on March 7. In September the premier stated that his chief ambition was to place Bulgarian finances on a sound basis, and this he expected to accomplish within two years. There appeared to be, however, greater difficulties than the premier had anticipated. In December it was announced that he had signed a contract with the Bank of Paris and the Netherlands for a new loan of 125,000,000 francs. Later in the month, by a majority of three votes, this contract was rejected by the Sobranje, whereupon the premier announced the suspension of the session and a dissolution of the Sobranje seemed imminent. Near the end of the year the Karaveloff ministry resigned, although the payment of the obligations, amounting to 10,000,000 francs and due on January 15, 1902, which it had been striving to meet, seemed assured. On September 7, the Sobranje decided to lay before the supreme court the charges against the members of the Ivanschoff ministry for violation of the constitution and misconduct in connection with the purchase of materials for the state railways. On July 11, 1901, the Grand Duke Alexander Mikhailovich, cousin and brother-in-law to the Czar, made an official visit to Prince Ferdinand—the first royal visit ever received by the Prince. The occasion had no apparent political significance beyond emphasizing the recognized fact of the preponderance of Russian influence in Bulgaria. This influence has been gradually increasing since the death of Stambuloff (1895). In September, 1901, the premier, M. Karaveloff, stated that Bulgaria, while desiring to be on good terms with all other countries, preferred the friendship of Russia.

During 1901 the propaganda of the Macedonian Committee (headquarters at Sofia) was continued, though apparently with small success. The aim of the committee, it will be remembered, is to effect reforms in the Ottoman vilayet of Adrianople and the Macedonian districts of Turkey, and ultimately to annex Macedonia to Bulgaria. These districts are inhabited largely by Wallachs, who oppose annexation, preferring to remain under Turkish authority, which, they hope, may be supervised by the powers. The plans of the committee also meet the disapproval of Roumania and Serbia, who fear Bulgarian aggrandizement. The committee works almost entirely *sub rosa*, fearing on the one hand the suzerain power of Turkey, which of course opposes its plans, and on the other hand the Bulgarian government itself, which, notwithstanding its alleged sympathy with the purpose, if not the practice, of the committee, does not dare openly to support the annexation scheme.

On March 27, 1901, a small band of Bulgarians attempting to enter Macedonian

territory, were defeated and driven back by Turkish troops. About the first of April the trial of 19 Bulgarians charged with revolutionary proceedings was concluded; 5 were acquitted, 11 sentenced to life servitude, and 3 condemned to death. In April the Bulgarian government forbade the meeting of the Macedonian committee, and on the fifth of the month all the prominent members of the committee in Sofia, including M. Saraff, the president, were arrested. As a result, on April 15, a mass-meeting of some 10,000 persons took place at Sofia to protest against the arrests and to express disapproval of the attitude of the Russian government on the Macedonian question. The meeting also proposed to appeal to the powers for intervention against the persecution of Bulgarians in Turkey. Similar meetings were held in provincial towns. Subsequently the moderate party in the committee, as against the extremists, represented by M. Saraff, elected M. Michailovski president of the managing committee. On August 14 M. Saraff and the other members of the committee charged with the murder of Professor Michailiana and M. Fitofski were acquitted. Meanwhile Turkish severities were taking place in Macedonia, and there were numerous arrests and convictions of persons accused of complicity in the designs of the Macedonian committee. The agents of the committee were said for the most part to be ordinary criminals. On October 5 a mass-meeting, comprising, it was said, some 20,000 persons, protested against the persecution of Bulgarians in Kastoria and called upon the Bulgarian government to appeal to the Porte. On the other hand it was reported late in December that through the agency of the Macedonian committee the persecution of Greeks for the purpose of compelling them to submit to the authority of the Bulgarian Church, had reached such a point that the Greek Patriarch had formally protested to both the Porte and the Russian ambassador at Constantinople. Moreover, at the close of the year, the Turkish commissioner at Sofia entered protest with the Bulgarian government regarding the committee. On the ground that the actions complained of had taken place in Turkish territory, the Bulgarian government repudiated responsibility. In November M. Daneff, minister for foreign affairs, said that no improvement in the relations of Bulgaria and Turkey were possible so long as the existing conditions in Macedonia continued, and he added that when the terms of the Treaty of Berlin should be carried out, the Macedonian committee would disappear. For the abduction of Miss Stone, the American missionary, by alleged agents of the committee, see **TURKEY**.

BUNCE, FRANCIS MARVIN, rear-admiral U. S. N. (retired), died at Hartford, Conn., October 19, 1901. He was born at Hartford, December 25, 1836, and graduated at the United States Naval Academy in 1857. Throughout the Civil War his services were varied and distinguished. As executive officer of the *Penobscot* he took part in the engagement with the Confederate batteries at Yorktown in 1862, and in the same year was in command of a successful expedition up Little River, between the Carolinas. In 1863 he was made a lieutenant-commander, conducting the naval attack on Morris Island, for which he was honorably mentioned by Admiral Dahlgren. A few months later he was placed in command of the monitor *Patapsco* in the siege of Charleston, where he was wounded, and after service on the monitors *Katskill*, *Lehigh*, and *Dictator* he was ordered to the *Monadnock*. He took the *Monadnock* from Philadelphia to San Francisco in 1865, demonstrating the ability of monitors to make long sea voyages. For this service, as remarkable as Captain Clark's voyage with the *Oregon* from San Francisco to Key West in the Spanish-American War of 1898, he was thanked by the secretary of the navy and recommended to the President for reward. The command of the *Atlanta*, the first of the new cruisers, was given to him in 1886, and in 1895 he was placed in command of the North Atlantic Squadron. In 1897 he became commandant of the Brooklyn Navy Yard, retaining the post after his retirement (1898), and performing valuable service in converting steamers and yachts to auxiliary cruisers for use in the war with Spain. His promotions occurred, to commander, in 1871; to captain, in 1883; to commodore, 1895; and to rear-admiral, in 1898.

BURGESS, Rt. Rev. ALEXANDER, Protestant Episcopal bishop of Quincy, Ill., died at St. Albans, Vt., October 8, 1901. He was born at Providence, R. I., October 31, 1819, and was educated at Brown University, graduating in 1838, and at the General Theological Seminary, where he graduated in 1841. Ordained a priest in 1843, he filled pastorates at Augusta and Portland, Me., was rector of St. John's Church, Brooklyn, N. Y., and of Christ Church, Springfield, Ill., which charge he held in 1878 when he was consecrated first bishop of Quincy, Ill. Bishop Burgess published a *Memoir of the First Bishop of Maine* (1869), a biography of his brother, Rev. George Burgess (1809-66), besides a number of sermons, addresses, and hymns.

BURMA, a province of British India lying between China and the Bay of Bengal, consists of Upper Burma, Lower Burma, and the Shan States. The estimated area of Upper Burma is 83,473 square miles, and the population, according to the census of 1901, 3,849,833, as against 2,046,933 in 1891; Lower Burma, 87,957 square miles with 5,371,328 inhabitants, as against 4,658,627 in 1891; the Shan States, about

40,000 square miles, with 1,228,460 inhabitants; total, upwards of 211,000 square miles, and 10,449,621 inhabitants in 1901. The people are mostly Buddhists. The chief town of Upper Burma is Mandalay (population, 182,498), and of Lower Burma Rangoon (population, 232,326). The province is administered under the Indian government, by a lieutenant-governor, Sir Frederic W. R. Fryer since 1897. The money of account is the silver rupee, which is valued at one-fifteenth of a British sovereign, or about 31 cents. The revenue for the fiscal year 1899 was reported at R x. 6,989,040, and the expenditures R x. 4,462,922 (R x. signifying 10 rupees). The foreign trade (that is, trade with all countries except India) by sea has increased remarkably in recent years. The foreign imports in the fiscal year 1901 amounted to R x. 6,870,000, as against R x. 4,870,000 in 1900. The foreign exports showed a slight decline, from R x. 10,780,000 in the fiscal year 1900 to R x. 10,030,000 in 1901; this falling off was due to the large quantities of rice diverted from foreign markets to India on account of the famine in that country. The trade with India (imports and exports) by sea in the fiscal year 1901 was valued at R x. 17,740,000, as against R x. 14,070,000 in the preceding year; of this increase R x. 2,330,000 represented increased shipments of rice to India. From the foregoing figures it appears that the total trade of Burma by sea amounted to R x. 34,640,000 (about \$112,233,000). It is worthy of note, in comparison, that the total trade in the fiscal year 1871 was reported at R x. 6,930,000; in 1881, R x. 14,000,000; in 1891, R x. 23,000,000. Of the imports in the fiscal year 1901 Great Britain sent about 60 per cent., and of the exports received about 20 per cent. Following, in order of importance, excepting India, were Egypt, the Straits Settlements, Germany, Japan, Belgium, the Netherlands, France, the United States, and China. In addition to the trade by sea may be mentioned the overland trade with China, the imports in the fiscal year 1901 amounting to R x. 286,500, and the exports R x. 321,000. The principal export is rice; the quantity sent to foreign countries in 1901 being valued at R x. 7,920,000 and to India R x. 7,360,000—the total amounting to about \$49,407,000. The export next in importance is teak. The three principal places in the world from which this wood is exported are Rangoon, Moulmein, and Bangkok (Siam). The shipments from Rangoon are by far the largest, while those from the other two ports are about equal. In 1899 there were 936 miles of railway open to traffic, and since that time a considerable mileage has been completed. On June 1, 1901, the lieutenant-governor formally opened the Gokteik viaduct and railway to Thibaw. In his visit to Burma in the fall of 1901, Lord Curzon, the Indian viceroy, emphasized the desirability of developing internal communications. In 1901 there appeared to be a growing dissatisfaction among the Kachins on the China frontier, who suffered from the incursions of the trans-frontier Kachins, while neither the Chinese nor the British authorities seemed able to give them relief.

BUSIEL, CHARLES ALBERT, former governor of New Hampshire, died at Laconia, N. H., August 29, 1901. He was born at Meredith, N. H., in 1842, and was educated at the Gilford Academy. He became a manufacturer, was interested in banking, and was for a time president of the Lake Shore Railroad. He was a member of the State legislature (1878-79), delegate to the National Democratic Convention in 1880, mayor of Laconia (1893-94), and governor of New Hampshire (1895-96). He was an unsuccessful candidate for United States Senator in 1896. At first a Democrat in politics, he changed his views later and was elected governor on a Republican ticket.

BUTLER, NICHOLAS MURRAY, professor of philosophy and education in Columbia University, New York City, was chosen acting president of that university in October, 1901. Upon the resignation of President Seth Low (*q.v.*) to accept the Fusion nomination for mayor of New York City, the trustees of Columbia selected Mr. Butler to act as the university's head, and after the former's political victory, Mr. Butler succeeded him as president. He was born at Elizabeth, N. J., April 2, 1862, and graduated at Columbia in 1882. In 1885 he became an assistant in philosophy, and rose to be dean of that department in 1890. In 1895 he became president of the National Educational Association and editor of the *Educational Review*. He is widely known for his educational work, and has published *The Meaning of Education*, and *Monographs on Education in the United States*, besides editing the *Great Educators Series*, and the *Columbia University Contributions to Philosophy and Education*.

BUTTERFIELD, DANIEL, major-general U. S. A. (resigned), died at Cold Spring, N. Y., July 17, 1901. He was born at Utica, N. Y., October 31, 1831, and graduated at Union College in 1849. Joining his father, who founded the American Express Company, he devoted himself to business until he entered the New York State militia, serving from 1851 to 1861, when, as colonel of the Twelfth New York Regiment, he joined the Union Army. General Butterfield took part in twenty-eight engagements during the Civil War, winning a medal of honor from Congress for

gallantry in action at Gaines' Mill in the peninsular campaign. He rose in rank until at the end of the war he had attained the rank of major-general of volunteers, and at the time of his resignation had received the brevet ranks of brigadier-general and major-general in the regular service. At the close of the war he was appointed superintendent of the general recruiting service of the army, and was put in command of the forces in New York Harbor, serving there from 1865 to 1869. In this latter year he resigned to become assistant treasurer of the United States in charge of the sub-treasury at New York.

CABLE, GEORGE WASHINGTON, the author of many familiar stories of Creole life in New Orleans, published in 1901 *The Cavalier*, a novel dealing with the South during the Civil War. The book is a sympathetic study of the spirit of the men who fought through the war on the Confederate side, and of the fortitude of the women who encouraged them in the long struggle. Mr. Cable was born at New Orleans, October 12, 1844, and was educated in the public schools of that city. From 1863 to 1865 he served in the Confederate army, in the Fourth Mississippi cavalry, and from the close of the war till 1879 he was on the staff of the New Orleans *Picayune*. Among his published books are *Old Creole Days*, *The Grandissimes*, *The Silent South*, *Dr. Sevier*, *The Negro Question*, and *Strong Hearts*.

CAINE, THOMAS HENRY HALL, the author of a number of successful novels, published in 1901, *The Eternal City*, a novel dealing with modern Italy and the conflict of church and state at Rome. The book attained a wide circulation, and while its value as a study of modern Italian life has been questioned, as melodrama it ranks with the author's other successes. Mr. Caine was born on the Isle of Man, May 14, 1853, and was educated there and at Liverpool. Trained as an architect, he soon abandoned that profession and became a writer for the Liverpool *Mercury*. He began his literary career by publishing, in 1882, *Sonnets of Three Centuries*. His most popular novels are *The Deemster* (1887), *The Bondman* (1890), *The Manxman* (1894), and *The Christian* (1898).

CALIFORNIA, a Pacific coast State of the United States, has a land area of 155,980 square miles. The capital is Sacramento. California was admitted to the Union September 9, 1850. The population in 1900 was 1,485,053, while in June, 1901, as estimated by the government actuary, it was 1,514,000. The populations of the four largest cities in 1900, were: San Francisco, 342,782; Los Angeles, 102,479; Oakland, 66,960; and Sacramento, 29,282.

Finance.—On January 1, 1901, there was a balance in the treasury of \$7,412,229.94. The receipts for the year ending December 31, 1901, were \$9,863,617.14, making a total of \$17,275,847.08. The expenditures for the year were \$10,044,918.08, leaving a balance in the treasury December 31, 1901, of \$7,230,929. The State debt at the end of the year was \$2,281,500, all bonded. This was neither increased nor diminished during 1901. All the funded debt bonds are owned by the State and held in trust for the schools and the State university, and the interest paid at the rate of 6 per cent. per annum, is applied to the support of the schools and the university. Practically, the State has no debt. The State tax rate for the year 1901-02 is \$.0048 per \$1.00, while the total value of State property, as returned for taxation, is \$1,241,705,803. For the banking interests of California, see article BANKS—BANKING.

Mining.—The value of the mining products of California, which for many years after the rapid exploitation of gold between 1852 and 1860, showed a marked decrease, has again increased of late years, though the former totals have not again been equaled. In 1852, the output of gold alone was valued at \$81,294,700, but from then on the value of the gold production declined and Colorado came to take the place of California as the first gold-producing State. The total value of all minerals produced in California in 1900 was valued at \$32,622,945, an increase of nearly 50 per cent. for 1893, when the output was valued at \$18,811,261. Gold, however, still remains the most valuable mining interest of the State, the yearly output being between \$16,000,000 and \$17,000,000. Second in value to the output of gold is that of copper, the principal minerals in the order of their commercial importance being gold, copper, petroleum, silver, quicksilver, and borax. Marked advances were made in 1901 in the mining of copper, petroleum, and quicksilver. The value of petroleum to Californian industries is much greater than its actual commercial value for the reason that the high prices for coal have heretofore acted to check the development and expansion of industrial and manufacturing concerns. The oil-producing wells in Los Angeles, Ventura, and Santa Barbara counties have proved extremely profitable, since the oil may be shipped either by rail or by water, and low transportation rates have thereby been insured. In Fresno and Kern counties in the interior, however, there has been much discontent over the railroad rates, and to avert these, pipe lines have been projected to the coast. Many new mines have been opened for the production of copper. In 1900 the copper output was valued at \$4,748,242, and it is believed that this value will be considerably increased in 1901. This industry has had

CALIFORNIA OIL FIELDS.—Wells in City of Los Angeles (Upper). Wells at Summerfield (Lower).

Courtesy National Oil Reporter.

also a stimulating effect on the development of gold quartz mines since quartz ore is greatly in demand for flux in the copper smelters. A large number of old quicksilver mines have also been reopened during the year and new locations prospected. For many years California has produced practically all of the quicksilver of the United States, but for several years past this industry was considerably neglected. Concerning the mining industry in general, it is said that California, unlike several other States and Territories in which there are large mining resources, has been able to attract, especially of recent years, an abundance of capital for the erection of modern reducing works and for the sinking of shafts where the mineral is not immediately accessible. By means of this capital it is asserted that mines producing a variety of minerals which had previously been closed and considered worked out, are now being made to pay a large profit. See articles GOLD, SILVER, PETROLEUM, COPPER, etc.

Industries.—Although California is an agricultural and mining State, the census reports for 1900 show that there has been a large growth in mechanical and manufacturing industries during the last fifty years. The population since 1850 has increased from 92,597 to 1,482,179, or 1,500.7 per cent., while the average number of industrial wage earners has increased from 3,964 to 91,047, or 2,196.8 per cent., embracing in 1900, 6.1 per cent. of the entire population. In 1900 there was invested in the 12,582 manufacturing establishments reporting a capital of \$205,395,025 exclusive of capital stock; the gross value of the products of these establishments was \$302,874,761, while the net products, exclusive of articles re-used in the process of manufacture was \$175,425,385. Four important conditions have at once limited the growth of manufactures in California and have determined in large measure the particular lines established. These conditions are the geographical position of the State, the high rate of wages, the high price of fuel, and the large resources of the State in mining and agricultural products. California is removed at once from the commercial centres of the United States and from the important markets of the world by great stretches of land and water. As a result of this, protection from outside competition has been insured and at the same time a steady but somewhat restricted home demand has developed for the products of local factories. On the other hand, the high price of fuel has combined with the high rates of transportation to restrict the building up of great industries. Coal delivered in San Francisco in June, 1900, cost from \$7.25 to \$8.50 a ton, or nearly three times the cost of coal in New York. It has recently been discovered that California possesses abundant stores of petroleum (see paragraph Mining), and this may practically solve the fuel problem. The largest manufacturing industry in the State is the refining of sugar and molasses, with products valued in 1900 at \$15,909,998, a decrease from 1890 of \$6,763,852. The prominence of this industry is due to the fact that San Francisco is the nearest port of entry for the raw sugar of the Hawaiian Islands. The second industry in importance is that of slaughtering and meat packing, with products valued in 1900 at \$15,717,712, an increase during the decade of \$5,948,154. Lumber and timber products in 1900 showed a value of \$13,764,647, an increase during the decade of \$4,969,992. The lumber industry is confined mainly to that section of the State lying north of Fresno County and west of the Sierra Nevada and centering in the red wood district in the counties of Humboldt and Mendocino. Flour and grist mill products were valued in 1900 at \$13,100,944. This industry supplies practically all of the flour used in the State, but the production for export has declined, owing to the opening of grain fields in other parts of the world and to the introduction of improved means of transportation, which has not proportionately benefitted California. The canning and preserving of fruit products in 1900 were valued at \$13,081,829. This shows an increase since 1890 of \$6,870,389, or 110.6 per cent. Another industry that has shown large growth is that of the manufacture of foundry and machine shop products, whose values in 1900 were placed at \$12,047,149. The demand for mining and agricultural tools and machinery and the heavy cost of importing them has been the foundation of this industry. California is the great grape growing region of the United States, and this has tended to stimulate the manufacture of liquors whose values in 1900 were estimated at \$9,261,600. Other industries are that of car construction and general steam railroad work with products in 1900 valued at \$7,553,626; the tanning and finishing of leather with products valued at \$7,405,981, the printing and publishing of newspapers with products valued at \$6,858,192, and the manufacture of explosives used largely in mining, with products valued at \$4,283,818.

Forests.—Congress was petitioned by the legislature to make laws providing for the inauguration of a system of forestry in California for the protection and utilization of the government forests. It was stated that the United States owned in California 8,000,000 acres of forest reserves, and that more timber was destroyed there every year by fires than was needed for five years of economical use; that if roads were constructed through the forests to protect them from fire and make them

accessible, and if the services of trained foresters were obtained, not only would employment be given to hundreds of men, but sufficient income would be produced to enable the government to buy up without additional outlay all the immense groves of giant trees existing nowhere else in the world except California, and at present owned by private parties.

The Citrus Industry.—In view of the discussions throughout the country as to the expediency of lowering the tariff provided for in the Dingley Bill, or, at any rate, of negotiating the pending reciprocity duties with foreign countries, the California legislature passed a resolution petitioning Congress to refuse, at any rate, to ratify the reciprocity treaty with Jamaica, admitting oranges to the United States on favorable terms. The orange and lemon industry was asserted in this resolution to be the leading industry of southern California, built up by thirty years of effort and at large expense, supporting 300,000 people, and representing over 3,000,000 bearing trees. If, it was said, the Jamaica treaty was ratified, grave injury would be worked to this industry because fruit rates from California to the east were much higher than freight rates to the United States by steamer from European ports and the West Indies; and it was only by means of the Dingley tariff, which equalized the freight rate to the east by increasing the duty on foreign fruit that the industry in California was enabled to hold its own.

Stanford University.—In accordance with a constitutional amendment adopted in November, 1900, authorizing the exemption from taxation of the property of the Leland Stanford, Jr., University, the legislature enacted a law in 1901 giving Stanford full powers and privileges of a corporation, allowing it, that is, to accept and hold the Stanford lands and gifts, and also exempting from taxation all the buildings and bonds held for the benefit of the institution; but providing, at the same time, that all other property of the university, real and personal, should be subject to State and county municipal taxation. The passage of this law, for which there had been agitation on the part of the university authorities since the founding of the institution, was said to be of very great advantage to it. For the law in effect permitted the university to use the entire interest from the beneficiary funds to increase the efficiency and enlarge the scope of its educational work.

Municipal Laws.—A law was passed permitting municipalities to issue bonds and incur indebtedness to the extent of 15 per cent. of the assessed value of the taxable property of the city for the purpose of constructing or acquiring municipal improvements, such as bridges, water supplies, sewerage, schoolhouses, fire apparatus, etc. And in order to protect the city from rapacious capitalists when it appeared inexpedient for the city to acquire franchises itself, it was provided that in all cities and towns franchises of all public or quasi public utilities should be sold after advertisement to the highest bidder; the price paid for the franchise was to be immediately paid to the city in cash, and the corporation buying the franchise was to further agree under penalty of forfeiture of the franchise to pay to the city after the first five years, and annually thereafter during the life of the franchise, 2 per cent. of the gross receipts of the corporation acquiring the same.

Labor Laws.—A law similar to one enacted in New York (see NEW YORK, paragraph Rate of Wages Law), and declared unconstitutional by the Court of Appeals of that State, was passed by the California legislature in 1901. This law, besides prescribing that laborers on public works should not be required to work more than eight hours a day, provided that all contracts made with contractors on behalf of the State or any political subdivision thereof, should contain an agreement by the contractor that he would not work his men more than eight hours a day, and that he would pay forfeit if he violated his contract in this particular. By another law, a fireman's relief, health, and life insurance, and pension fund was created in the several cities, counties, and towns of the State. It was also enacted that policemen in cities should not work more than eight hours a day, and it was alleged one of the effects of this law would be the employment of 200 more patrolmen in the city of San Francisco alone. By another law, an attempt was made to protect workingmen from the competition of convict-made goods, it being made unlawful for convicts to work on stone cutting or stone dressing, and made unlawful also for any person to sell in the State "any article or articles manufactured wholly or in part by convict or other prison labor, except articles the sale of which is specifically sanctioned by law." For the protection of minors, a law was enacted that no person under eighteen should be employed in any manufacturing, mercantile, mechanical, or other establishment more than 54 hours a week, that children under 12 should not be employed at all, and that employers having employees under 16 should keep a notice posted showing the age and hours of work of such employees. At the same time that an endeavor was made to limit the utility of convict labor, an endeavor was also made to restrict the labor of aliens, it being provided that no person, except a native born or naturalized citizen of the United States, should be employed in any department of the State or of any county or city. Other labor laws prescribed that all men in

sawmills and logging camps should be given an hour off at noon, and that the practice of barbering should henceforth be regulated by a registering, licensing, and examining commission in order to insure more skilful work and more sanitary conditions of work.

Other Laws.—One hundred thousand dollars was appropriated to be expended by the State Board of Health, under the direction of the governor, for the prevention of the introduction of Asiatic cholera, bubonic plague, and other infectious and contagious diseases. An act of 1897, creating a commission for the promotion of uniform legislation throughout the United States, was repealed. An act of 1893, providing that all convicts, excepting those who were under sentence for murder in the first or second degree, might be paroled after having served one year, was extended by providing that all prisoners under life sentence might also be paroled after seven years, and that all others might be paroled after one year. Kidnapping was made punishable for life or for any number of years not less than ten. Two hundred and fifty thousand dollars was appropriated for the use of the University of California for the current year. An act was passed, authorizing the practice of osteopathy in the State, providing, however, that the applicant had passed an examination or met the requirements set by a State board of osteopathic examiners; said board to consist of five members graduated from a legally authorized school of osteopathy. The libel law of the State was strengthened by making it a misdemeanor to write, print, or circulate a political pamphlet intended to defeat the nomination or election of any candidate for office, unless the name of the person or political party issuing the same plainly appeared upon the circular. An act was passed, making it obligatory for the authorities of any city or town in the State when requested by one-fourth of the electors, to establish therein a public library. An act was passed creating a State board of architecture to consist of ten persons appointed from societies of architecture of recognized standing; the board was to test the fitness of candidates to be recognized architects. And in future, all those who practised architecture without a certificate issued by the board were required to make it publicly known that they were unrecognized architects.

State Officers.—Holding office in 1901 and through 1902: Governor, Henry T. Gage, Republican, elected for four years, term expires in January, 1903; lieutenant-governor, Jacob H. Neff; secretary of state, Charles F. Curry; controller, Edward P. Colgan; treasurer, Truman Reeper; attorney-general, Tiley L. Ford; surgeon-general, M. J. Wright; superintendent of education, Thomas J. Kirk; insurance commissioner, A. J. Clunie.

Supreme Court: Chief justice, term four years and until January, 1903, W. H. Beatty; associate justices, T. B. McFarland, C. H. Garoutte, R. C. Harrison, W. Van Dyke, F. W. Henshaw, and Jackson Temple—all Republican except Jackson Temple and W. Van Dyke.

Congressional Representatives (57th Congress). In the House—Frank L. Coombs, from Napa; Samuel D. Woods, from Stockton; Victor H. Metcalf, from Oakland; Julius Kahn, from San Francisco; Eugene F. Loud, from San Francisco; James McLachlan, from Pasadena, and James C. Needham, from Modesto—all Republicans. In the Senate—George C. Perkins, from Oakland, and Thomas R. Bard, from Hueneme—both Republicans.

CALIFORNIA, UNIVERSITY OF, Berkeley, Cal., funded 1868. For the collegiate year 1901-02 the teaching force is reported at about 250 and the attendance at 2,932, as follows: Academic departments, 2,261; art, 178; law, 100; medical, 150; post-graduate medical department, 11; dentistry, 141; pharmacy, 85. The percentage of women was about 45. On January 1 the medical department was fully merged into the university and its separate board of trustees discontinued. The announcement has been made that with the autumn of 1905 two years of college work will be required for entrance into its medical school. A uniform list of admission requirements for the colleges of letters, social science, and natural sciences has been adopted which will go into effect in 1906. The requirements are the same as those of Harvard. There are 116 high schools, public and private, whose graduates are qualified to enter the university without passing entrance examinations. During the past year gifts from Mrs. Phoebe A. Hearst included \$50,000 to sustain the new department of anthropology. A new department of irrigation was established, with Elwood Mead in charge. The income for the year 1901-02 was estimated at \$319,945, and represents an outlay of about \$165 per student, as compared with \$565 at Columbia, \$416 at Chicago, and \$299 at Harvard.

CAMBODIA, one of the countries comprising French Indo-China, is located on the Gulf of Siam between Cochinchina and the Kingdom of Siam. It has an estimated area of 40,530 square miles, and a population of about 1,500,000. The capital is Prom-Penh, with 50,000 inhabitants. The government is carried on in the name of the king of Cambodia, but the French resident presides at the state council, and the internal affairs are almost entirely in the hands of French officials. The budget

for 1900 was fixed at 2,315,587 piastres, including an allowance of 520,510 piastres for the civil list of the king. The chief products are cinnamon, coffee, pepper, cotton, maize, and rice. The foreign trade is carried on largely through the port of Saigon in Cochín-China (*q.v.*) with which the trade statistics are included. See **INDO-CHINA**.

CAMEROON, a German protectorate in West Africa, extending from the Bight of Biafra north-eastward to Lake Tchad. It lies between Nigeria on the north and the French Soudan and French Congo on the east and south. Its area is estimated at 191,130 square miles, and its population at 4,500,000, consisting of Bantu negroes on the coast and Soudan negroes inland. The region is not healthful for Europeans, and in 1900 there were but 528 white persons in the territory—an increase of 103, however, over the white population in 1899. Of these, 433 were Germans, 47 English, 19 Americans, 11 Swedes. Among them were 44 women, of whom 35 were Germans. Of the white population, 86 (all Germans) are connected with the administration and the army, 182 are merchants, 71 are missionaries, and 92 are planters. They are distributed among the following districts: Cameroon, 171; Edea, 33; Victoria, 200; Kribi, 108; Sanga Ngoko, 16. The protectorate is administered by an imperial governor, who is assisted by a local council. The capital town has been moved from Cameroon (re-named, in the spring of 1901, Duala) to Buea. There are government stations at Rio del Rey, Buea, Yaunde, Lolodorf, Campo, Johann Albrechtshöhe, Yoko, Sanga Ngoko, and in 1900 a new station was erected at Nssakpa, and a military station at Ebolowa. Government schools have been established at Victoria and Duala; in 1900 the first had 104 pupils and the second 97 pupils. Four missionary societies have organized schools, comprising about 5,000 pupils. The province has never been self-supporting; indeed of late, the amount supplied by Germany to balance the budget has increased. In 1898, it was 814,000 marks; in 1901, it was 2,192,000 marks. The total budget in 1901 balanced at 3,788,800 marks. (The mark is worth 23.8 cents.) The main source of income is the tax on imports, amounting in 1901 to 1,400,000 marks. The value of the imports for 1899-1900 were computed at 12,726,734 marks, and the exports at 5,156,943 marks. The little increase in exports over previous years was due to a falling off in the production of palm oil, palm-kernels, gum, and ivory; the exports of valuable woods, of cacao and of Kala nuts increased. In June, 1900, 3,056 hectares of land (one hectare = 2.471 acres) were under cultivation, 2,201 hectares being planted with cacao trees. Four new German trading houses were established in 1900, bringing up the number of German firms to 15. There are 7 English houses. Three steamship lines connect the protectorate with Europe. There are five post-offices at Duala, Victoria, Buea, Rio del Rey, and Kribi, through which, in 1899-1900, 149,794 letters passed, besides packages and 6,308 newspapers. The office at Duala is connected by cable with Bonney, in southern Nigeria. During 1901 a company was formed to build a railway from Victoria to Mundame. The negroes of the interior are turbulent, and an army of about 600 natives, officered by Germans, is maintained to keep order. In 1900 there were several uprisings, and the postmaster at Rio del Rey was killed. Von Besser, in command of an expedition, punished the guilty parties and established a station at Nssakpa. The Buli, who had attacked Kribi, were defeated, and the military station of Ebolowa was erected in their district. A rebellion among the southern tribes, the Baköë, Mangissa, Yemisse, and Bogha-Gane, was suppressed.

CAMPBELLITES, or **CAMPBELLITE BAPTISTS**, a term popularly applied to Disciples of Christ (*q.v.*).

CAMPOAMAR Y CAMPOOSORIO. **RAMÓN DE**, Spanish poet, philosopher, and statesman, died at Madrid, February 12, 1901. He was born at Navia in Asturia, September 24, 1817, and went to Madrid in 1837 to study medicine. After a short time he studied law, but after the publication of his *Poesías* (1840) devoted himself to literature. Later still he entered politics, serving as governor of Castellón, Alicante, and Valencia, and was several times a member of the Cortes, where he won distinction as an orator. He withdrew from politics after the revolution of 1868, but upon the accession of Alfonso XII. in 1875, became a councillor of state, and was chosen to the Royal Spanish Academy. As a poet de Campoamor was intensely individual and human, a psychologist in method, writing in a simple, direct style that appealed to the people. Though never deeply stirred, and deprecating the manner of the grandiloquent school of poets contemporary with his early period, he gained a firm command of poetic form; and his best work is found in his peculiar adaptations of verse forms, embodying the crisp, short, epigrammatic thought. Of these forms he has characterized the "Humoradas" as the shells of epigrams, the "Doloras" as dramatized Humoradas, and the "Pequeños Poemas" as amplified Doloras, or poems of the little. His more ambitious poems include, *El Drama Universal* (1873), an epic poem in eight cantos; *Colón* (1859), a narrative in sixteen cantos; and eight cantos of a legendary poem, *El Licenciado Torralba*. He was a philosopher of the

most modern type, touched with cynicism, but good-naturedly tolerant of that which he felt bound to criticise, and witty withal. His philosophical writings include *Filosofía de las leyes* (1846), *El Personalismo* (1850), *Polemicas con la democracia* (1862), *Lo Absoluto* (1865), and *El Idealismo* (1883).

CANADA, DOMINION OF, the largest colonial possession of Great Britain, occupying the northern part of the North American continent. The capital is Ottawa.

Area and Population.—The total area, exclusive of the territory of Franklin, whose area is unknown, is placed at 3,653,946 square miles, including 605,253 square miles of water surface. The population, census of 1891 and of 1901, is stated as follows:

Province.	1901.	1891.	Increase.
Ontario	2,182,947	2,114,321	68,626
Quebec	1,648,898	1,488,535	160,363
Nova Scotia	459,574	450,396	9,178
New Brunswick	331,120	321,263	9,857
Manitoba	254,947	152,506	102,441
British Columbia	178,657	98,173	80,484
Northwest Territories	158,940	66,799	92,141
Prince Edward Island	103,259	109,078	5,819
The Unorganized Territories	52,709	32,168	20,541
Total Population.....	5,371,051	4,833,239	537,812

The population of the largest cities in Canada, according to the census of 1901, together with the increase since 1891, is shown in the following table:

City.	Population 1901.	Increase since 1891.	City.	Population 1901.	Increase since 1891.
Montreal	266,826	46,645	London	37,983	6,006
Toronto	207,971	26,751	Vancouver	26,196	12,487
Quebec	68,834	5,744	Victoria	20,821	3,980
Ottawa	59,902	15,748	Kingston	18,043	1,220
Hamilton	52,550	3,570	Brantford	16,631	3,878
Winnipeg	42,336	16,697	Hull	13,988	2,724
Halifax	40,787	2,292	Charlottetown	12,080	707
St. John.....	40,711	1,532	Valleyfield	11,055	5,540

Thus the population of the Dominion shows an increase of 537,812, or nearly 11.13 per cent. for the decade of 1891-1901, as compared with over 11 per cent. for the decade of 1881-91, and 17 per cent. for the decade of 1871-81. These figures are certainly disappointing when the natural advantages of the country are considered, and they lose still more when compared with the increase of the population of the United States during the decade of 1890-1900. According to a statement published recently by the British Board of Trade, the emigration from Canada to the United States within the last year was estimated at 65,000 to 75,000, while the emigration from the United States to Canada amounted only to about 13,000. New York City alone, according to preliminary census figures, contains nearly 22,000 Canadians, and it is estimated that Chicago has about half as many Canadian residents. An examination of the first table given above will show that the province of Quebec has the largest absolute increase, the Northwest Territories, the largest relative increase (118 per cent.), and Prince Edward Island the only decrease. From the two tables it may be seen that the cities have increased at a faster rate than the entire Dominion—a fact that is hardly to be considered as a favorable symptom in an undeveloped country like Canada.

Government.—By a parliamentary act of 1867, authorizing and establishing the Canadian federation, Canada was virtually created an independent republic, though with a titular executive representing the English crown. This executive, the governor-general, rules by and with the consent of the privy council, but the privy council is composed of certain members of the dominant party in the Canadian Parliament, and is headed by the premier, the leader of his party and the real executive of Canada. The legislative power is vested in a federal parliament, consisting of a Senate and a House of Commons. The House of Commons consists of 213 members elected for a term of five years, and the Senate of 81 members, nominated for life by the governor-general upon the recommendation of the council. Representation in both houses is based approximately upon population and changes in both the number and distribution may be made in accordance with the findings of the census. Local self-government is provided for by provincial legislatures and by a territorial legislature, but the provincial and territorial executives are nominated by the governor-general with the advice of the privy council.

The ministry of the Liberal party, which came into power at the general elections of 1896, is at present constituted as follows: Premier and president of the council, Sir Wilfrid Laurier; secretary of state, R. W. Scott; minister of trade and commerce, Sir R. J. Cartwright; minister of justice and attorney-general, David Mills; minister of marine and fisheries, Sir L. H. Davies; minister of railways and canals, A. G. Blair; minister of militia and defense, F. W. Borden; minister of finance, W. S. Fielding; postmaster-general, W. Mulock; minister of agriculture, S. A. Fisher; minister of public works, J. I. Tarte; minister of interior, Clifford Sifton; minister of customs, William Paterson; minister of inland revenue, M. C. Bernier. Charles Fitzpatrick, solicitor-general, has no seat in the cabinet, while R. R. Dobell and J. Sutherland have cabinet positions but are without portfolios.

Finance.—The general economic prosperity of the country in 1900 is manifested both in its commerce and in its public finance. The revenue and expenditure for the fiscal year 1900 amounted to \$51,039,994 and \$42,975,280 respectively, leaving a surplus of \$8,054,714, the largest in the history of the Dominion. The increase in the revenue of \$4,298,744 over the preceding year was due largely to the increased custom receipts, which amounted in 1900 to \$28,889,110, as against \$25,734,229 in 1899. The other sources of revenue were postal receipts and internal and miscellaneous revenues. The chief items of expenditure were charges on the public debt, \$13,392,479; railways and canals, \$5,433,127; post-office, \$4,807,484; subsidies to provinces, \$4,250,608; and public works, \$2,472,748. The gross debt of the Dominion at the end of the fiscal year 1900 amounted to \$346,206,980, as against \$345,160,903 at the end of the preceding year. The assets amounted to \$80,713,173, of which \$60,572,589 were interest-bearing. The average rate of actual interest paid on the debt in 1900 was 3.09 per cent.

Agriculture.—According to official statistics the total area of land set out for settlement in the Dominion at the end of 1900 was nearly 82,000,000 acres. During 1900 there were made 7,848 homestead entries, representing 24,565 persons. According to nationality, the entries were made by 3,331 Canadians, 1,851 by immigrants from the United States (including 170 returned Canadians), 955 by immigrants from Great Britain, 50 French, 259 Germans, 1,043 Austro-Hungarians, 80 Russians, 101 Swedes and Norwegians, 71 Icelanders and 107 by immigrants from other countries. The statistics of crops are given under the separate provinces, and the agricultural importance of the Dominion, as a whole, may be judged from its exports of domestic agricultural and animal products. These exports for the fiscal year 1900 show a very considerable increase as compared with the exports for the preceding fiscal year, and were made up as follows: Wheat, 16,844,650 bushels (10,305,470 in 1899); wheat flour, 768,162 barrels; oats, 6,929,214 bushels; peas, 3,059,927 bushels; and barley, 2,156,282 bushels. The exports of live stock from the Dominion in 1900 comprised 10,053 horses, 205,524 cattle, and 459,944 sheep. The chief animal products exported during the same year, with comparisons for the previous year, were: Bacon, 132,175,688 pounds (111,868,938 pounds in 1899); hams, 2,856,186 pounds (4,783,989); beef, 2,847,180 pounds (363,810); canned meats, 2,879,897 pounds (1,110,165); butter, 25,259,737 pounds (20,139,195 pounds in 1899 and 11,253,787 pounds in 1898); eggs, 10,187,906 dozen (9,652,512); and cheese, 185,984,430 pounds (189,827,839). The total value of the exports of domestic agricultural and animal products for the fiscal year 1900 amounted to \$81,858,450, as compared with \$68,140,758 in 1899. Of the total amount, Great Britain took 85.6 per cent., and the United States, 8.62 per cent.

Mineral Production.—Next to agriculture, mining is the chief industry of the Dominion, whose importance as a mineral producing country has been increasing very rapidly. The total value of the mineral output, according to figures prepared by the Geological Survey, was \$63,775,090 for the calendar year of 1900, showing an increase of over \$14,000,000 or over 28 per cent., as compared with 1899. The output of the leading metals was as follows: Gold, \$27,916,752 (\$21,261,584 in 1899); copper, 18,919,820 pounds, valued at \$3,063,119 (15,078,475 pounds, valued at \$2,655,319 in 1899); nickel, 7,080,227 pounds, valued at \$3,227,707 (5,744,000 pounds, valued at \$2,067,840 in 1899); silver, 4,446,505 ounces, valued at \$2,730,598; lead, 63,169,821 pounds, valued at \$2,760,521 (21,862,436 pounds, valued at \$977,250 in 1899). The chief non-metallic minerals were coal, 5,332,197 short tons, valued at \$12,668,475; coke, 157,134 tons; and petroleum 710,498 barrels, valued at \$1,151,007. Out of a total consumption of 167,169 short tons of pig iron in 1900, about 61 per cent. was produced in the Dominion (including over 40 per cent. made from foreign ore). The exports of domestic mineral products in 1900 amounted to \$26,116,077 (\$14,143,149 in 1899). The United States took \$24,355,843, against \$12,913,311 in 1899. In 1901 there were in Canada 7 iron works in operation, with an annual capacity of 440,000 tons. There was also being constructed by the Lake Superior Power Company an extensive plant for the manufacturing of pig iron, steel, and steel rails at Sault Ste. Marie, Ont., which will be the first establishment for the manufacturing of steel rails in the Dominion.

Fisheries.—The yield of the Dominion fisheries for the calendar year 1899 (the latest for which official statistics are available) shows an increase over the preceding year, although it still falls short of the yield of 1897. The total value for 1899 was \$21,891,706, as compared with \$19,667,126 for 1898 and \$22,783,546 for 1897. The chief kinds of fish caught during 1899 were: Cod, \$3,738,223; lobsters, \$2,870,000; salmon, over \$4,000,000; and herring, over \$2,000,000. Nearly 80,000 men were employed in the fishery industry, and the value of the plants (excluding lobster canneries) was over \$10,000,000. The bounties paid to fishermen by the government, under the act of 1882, amounted in 1899 to \$160,000, making the total amount paid, since the passing of the act, \$2,841,369. The sealing industry for 1900 shows only a slight improvement over the preceding year, the catch for the two years being 35,523 and 35,346 respectively. The exports of the products of the Canadian fisheries for 1900 was the largest in the history of the Dominion, amounting to \$11,169,083 against \$9,909,662 in the preceding year.

Commerce.—The official figures for the trade of the Dominion for the fiscal year 1900 are of the most encouraging nature. The aggregate value of the imports and exports for that year was the largest in the history of the country, exceeding the total commerce of the preceding year by over \$60,000,000 (\$381,517,236 against \$321,661,213). The imports amounted to \$189,622,513 (\$162,764,308 in 1899), of which \$180,804,316 represented imports for home consumption. Of the latter, the United States contributed \$109,844,378 (\$93,844,378 in 1899); Great Britain, \$44,789,730 (\$37,060,123 in 1899); and other countries, \$26,170,208 (\$23,984,304 in 1899). During the last decade of the 19th century the proportion of imports from the United States, in the total imports for home consumption, to the Dominion increased from 46.37 to 60.75 per cent., while the imports from Great Britain during the same period decreased from 38.48 to 24.77 per cent., notwithstanding the advantages of the preferential tariff, which has been in force since 1898. The imports for 1900, with comparative figures for the preceding year, were made up as follows: Articles of food and animals, \$30,008,980 (\$29,011,195); crude products used in domestic industries, \$33,351,292 (\$29,241,888); articles wholly or partially manufactured used in domestic manufactures and mechanical arts, \$35,679,437 (\$26,116,487); manufactured articles ready for consumption, \$60,838,204 (\$53,132,914); articles of voluntary use, luxuries, etc., \$12,628,965 (\$11,843,975). The total value of the imports under preferential tariff was \$24,954,262 in 1898, \$26,597,442 in 1899, and \$27,095,791 in 1900. The value of the domestic exports in 1900 was \$170,642,369 (\$138,462,037 in 1899), of which \$96,562,875 went to Great Britain, \$59,666,556 to the United States and \$14,412,938 to other countries. Thus the exports to Great Britain decreased for the year from 61.47 to 56.59 per cent. of the total, while those to the United States increased from 29.30 to 34.97 per cent. Taking, however, the entire last decade of the 19th century, the exports to Great Britain show an increase from 48.67 to 56.59 per cent., while those to the United States show a decrease from 42.48 to 34.97 per cent. The domestic exports for 1900 were made up as follows: Mineral products, \$24,575,155 (\$13,365,442 in 1899); fishery products, \$11,169,083 (\$9,909,662); forest products, \$4,495,789 (\$5,486,724 in 1899); animals and animal products, \$56,148,809 (\$46,743,130); agricultural products, \$27,516,609 (\$22,952,915 in 1899); and manufactures, \$39,397,277 (\$34,244,220). Preliminary figures for the fiscal year 1901 give the aggregate value of the trade of the Dominion as \$394,000,000. The number of failures for 1901 was 1,341 (1,355 in 1899), with liabilities amounting to \$10,811,671, and assets of \$7,686,823. See the foregoing paragraphs on Agriculture, Mineral Production, and Fisheries.

Currency and Banking.—The average monthly note circulation in the Dominion during 1900 was \$26,550,465, as against \$25,041,650 in 1899 and \$23,229,779 in 1898. The aggregate paid-up capital of the Dominion banks at the end of the calendar year 1900 amounted to \$65,154,594 (\$63,726,399 in 1899), and the notes in circulation, \$46,574,780 (\$41,513,139 in 1899). The clearings at the clearing-houses of Montreal, Halifax, Toronto, Hamilton, Winnipeg, St. John, Victoria, and Vancouver amounted to \$1,589,560,411 (\$1,625,680,194 in 1899), of which over 46 per cent. was transacted at the clearing house of Montreal, and over 32 per cent. at that of Toronto. Deposits in the government savings banks, which are under the supervision of the Department of Finance, are being gradually transferred to the post office savings banks. The number of the latter at the end of the fiscal year 1900 was 847 (838 in 1899), with 150,987 depositors and deposits amounting to \$37,507,456, or \$248.41 per depositor. The 24 government savings banks had at the same date 45,773 depositors and deposits amounting to \$15,642,267, or \$341.74 per depositor.

Shipping and Communication.—The registered shipping of Canada, including vessels for inland navigation, comprised at the end of the calendar year 1899 1,942 steamers, with a net tonnage of 157,185; and 4,631 sailing vessels, with a net tonnage of 499,552. In 1899, 13,909 sea-going vessels entered at Canadian ports, and 13,212 cleared; the tonnage was 6,733,151 and 6,503,903 respectively. Of

the total number of vessels entered, 5,537, with a tonnage of 921,184, were Canadian; 2,563, with a tonnage of 2,248,311, were British; and 5,809, with a tonnage of 2,325,656 were foreign. The coasting navigation during the same year amounted to nearly 16,000,000 tons, almost exclusively in British and Canadian vessels. The water-ways of the Dominion have a total length of over 2,700 miles. The traffic through the canals in 1899 amounted to 7,594,304 tons; and the tolls to \$276,658, as compared with \$325,149 in the preceding year. Of the total tonnage, 4,308,571 tons were divided between 23,579 Canadian steamers and sailing vessels; and 3,285,733 tons between 6,101 United States steamers and sailing vessels. The railway lines of the Dominion in operation had, at the end of the fiscal year 1900, a total length of 17,657 miles, as compared with 17,358 miles at the end of the preceding year. The train mileage increased from 52,215,207 in 1899, to 55,177,871 in 1900; the number of passengers from 19,133,365 to 21,500,175; the freights, from 31,211,753 tons to 35,946,183 tons. The earnings for 1900 amounted to \$70,740,270 (\$62,243,784 in 1899), or \$4.006 per train mile; and the working expenses to \$47,699,798 (\$40,706,217 in 1899), or \$2.701 per train mile. The private companies, with 16,146 miles of road in operation, had at the end of 1900 a paid-up capital of \$933,632,205; the government railways, with a mileage of 1,511, had a paid-up capital of \$64,636,200. The proportion of expense to receipts on the private lines during 1900 was 65.21 per cent.; while the government lines show a percentage of 98.42. The total amount paid out by the Dominion government in railway subsidies from 1883 to the end of the fiscal year 1900 was \$20,200,312. The telegraph lines of Canada had at the end of 1900 a total length of 34,623 miles, of which 3,906 miles (including 240 miles of cable) were owned by the government. The private lines belong to the Great Northwestern Telegraph Company, the Canadian Pacific Railway Company, and the Western Union Telegraph Company. The number of post offices at the end of the fiscal year 1900 was 9,627. The postal revenue and expenditures for the same year amounted to \$4,345,823, and \$4,807,484 respectively; while the amount of mail subsidies paid out by the department of trade and commerce for the year was \$599,832.

Education.—Public instruction in Canada is entirely under the control of the separate provinces. The number of public schools for the entire Dominion in 1900 was 17,989, with an enrollment of 945,088. Of other schools there were 974, with a total enrollment of 143,064. The revenue from all the schools was \$9,985,226, of which the government contributed \$1,251,611. The expenditures amounted to \$9,461,496. Canada has 17 degree-conferring institutions, and about 25 colleges. The libraries number 535, of which 380 are public, and 418 are situated in the province of Ontario. The total number of volumes is 1,972,056, and of pamphlets, 122,746.

HISTORY.

Political Parties.—In Canada, as in Great Britain, Conservatives and Liberals constitute the chief political parties. The Conservatives, it may be noted, prefer to be called Liberal-Conservatives. With the exception of one interval of five years, the Conservatives were in power from the establishment of the Dominion in 1867 until 1896. In the general elections of the latter year the Liberals, under Sir Wilfrid Laurier, were placed in power by large majorities, notwithstanding that the united Catholic influence was on the side of the Conservatives. There were returned to the House of Commons 118 Liberals, 86 Conservatives, and 8 independents of Liberal leanings. The general elections of 1900 resulted as follows: Liberals, 125; Conservatives, 78; independents, 10. Sir Wilfrid Laurier, as premier, continued in power. Mr. R. L. Borden, senior member for Halifax, was unanimously chosen as Conservative leader in succession to Sir Charles Tupper, who, rejected by Cape Breton in the last election, retired from public life in his eightieth year on score of age, refusing offers of constituencies from every province. Mr. Louis Philippe Brodeur was elected speaker of the House.

The census returns of 1901 will effect a change in the next decennial distribution of seats, the unit of representation in the House of Commons being based on the population of Quebec, whose representation is fixed at 65 members. Manitoba, in consequence, will gain 3 members, the Northwest Territories and British Columbia 2 each, while Nova Scotia will lose 2 and New Brunswick and Prince Edward Island 1 each.

Parliamentary Session.—Lord Minto, the governor-general, opened the ninth Parliament of the Dominion on February 7, 1901, the members having assembled the day previous to take the oath of allegiance to the new King. In his speech, Lord Minto referred to the marvelous progress made in the mining and agricultural regions of western Canada, to the great improvements effected in the navigation of the St. Lawrence by the widening and deepening of the channel between Quebec and Montreal, and to various other matters connected with the Dominion's development. The chief business of the session included the following: The appointment of a railway commission, intrusted with plenary powers to enforce

the provisions of the Railway Act, especially to prevent a recurrence of discrimination in railway freight rates injurious to agricultural interests in the western parts of the Dominion; the establishment of a branch of the Royal Mint to coin Yukon and British Columbia gold into Dominion currency as required, and the balance into English sovereigns (previously there had been no Canadian gold coinage); the installation of the Marconi wireless telegraphy system in the Gulf of St. Lawrence, with a preliminary station at Anticosti; the connection by cable of Belle Isle with the joint line to Quebec; and the voting of an annual subsidy of \$100,000 for a direct steamship line between Canada and France, half the vessels to be under the British and half under the French flags, so that subsidies would be earned from both countries. Tenders were also invited by the Dominion government for a service of fast steamships between Canada and England. It was estimated that with vessels of 21 knots an hour the passage could be made in less than four days between Queenstown, Ireland, and Sydney, Cape Breton, the suggested terminals. The Montreal Board of Trade asked for the appointment of a Royal Commission to investigate the alleged discrimination against the St. Lawrence route by English marine insurance underwriters, and also advocated the establishment of a Canadian Lloyds Maritime Insurance Association.

Imperial Relations.—The death of Queen Victoria and the accession of King Edward VII. were marked with the customary solemnities and ceremonies. The Dominion Parliament decreed that May 24, the Queen's birthday, should be known as Victoria Day and be kept as a holiday for all time. The Dominion's memorial takes the form of a Victoria National Museum in Ottawa, to cost \$1,000,000. In September, 1901, the visit and tour of the Duke of Cornwall, heir apparent to the throne (who became Prince of Wales on November 9, 1901), accompanied by the Duchess of Cornwall evoked in Canada enthusiastic expressions of loyalty, though the brilliant proceedings were tinged with the sadness occasioned by the assassination of President McKinley. The day of the President's funeral was marked by a suspension of the spectacular parts of the programme attending the royal visit. Throughout the Dominion generally, and at Ottawa in particular, the maintenance of imperial unity and of loyalty to the mother country was manifested in the continued support accorded to the prosecution of the Boer war, especially in the numerous enlistments for the South African constabulary. The question of colonial representation in the Imperial House of Lords and on the judicial committee of the privy council, as tending to increase the efficiency of the tribunal and make it more popular as a court of final resort from the colonies, received the cordial support of the Anglo-Canadian legal fraternity. On the other hand, the question of national independence as the principal plank of a Parliamentary party, was prominently urged by French lawyers and Liberal members, who believe that an independent commonwealth secured by constitutional means would progress more rapidly, although the *status quo* is to be preferred to annexation to the United States. Early in 1901 the relations between Great Britain and Canada were succinctly defined in a speech at Toronto by Sir Wilfrid Laurier, the premier, who said: "Canada, while still a colony, is practically an independent nation, and the result of the present system has been to lead to thoughts of closer union than ever before. While no one supposes that the present relations with Great Britain are to last, they are satisfactory at the present day, and when in the course of the future new problems shall arise, they will be faced and solved on the strictest lines of Canadian nationality and British citizenship." The visit in November, 1901, of the Irish Nationalist delegates, during their American tour, was interesting as a phase of the question of imperial unity. The delegates, Mr. J. Redmond, M. P., Mr. P. A. McHugh, M. P., and Mr. O'Donnell, M. P., received a cordial welcome at Ottawa by a large audience, which included the three ministers of state, Sir Wilfrid Laurier, Mr. Scott, and Mr. Sifton. Mr. Redmond, in a moderate speech, held that the Canadian example of home rule afforded the strongest possible argument in favor of the concession of the Irish demand, and broadly hinted that another expression by the Canadian Parliament in favor of Irish home rule would be acceptable. He justified the use of physical force, if necessary, but declared that his party relied on constitutional measures to secure responsible government for Ireland. The question of national and imperial defense received its due share of agitation, and the burden of the defense and maintenance of the chief Canadian stations and border posts were strongly urged by voice and press, of Anglo-Saxon tendencies, upon the Canadian government as a natural sequence to the growth and prosperity of the Dominion.

In the British Parliament the budget proposals of the Dominion government came into prominence over the statement that the minister of finance maintained the preference of 33 1-3 per cent. granted on British imports, even when the colonies were freed from the restraining foreign treaties of 1862 and 1865, and information was desired whether any reciprocal arrangement on the part of England was to be made concerning Canadian goods. A reply was elicited that while the action of

Canada was confined to the reduction of high duties in favor of England, reciprocity on the part of England would involve the imposition of duties on imports from other countries for the benefit of Canada, a proceeding which the Dominion scarcely expected. Appreciation of the Dominion's spirit had been shown in the aid given both in the steamship service between Canada and Japan, and towards the Pacific cable (*q.v.*), which was in course of construction.

Internal Events.—A strike of wool workers took place in 1901 because of a reduction of wages, caused by the employers' inability to compete with British goods under the preferential tariff. Other strikes included one of 74 days among railway workers on the Canadian Pacific Railway, and another at Ottawa, among carpenters, tinsmiths, machinists, and woodworkers, to obtain higher wages, shorter hours, and recognition of unions. In a strike of ship laborers at Quebec for a ten-hour day at twenty-five cents an hour, the strikers were brought to terms by the uninterrupted prosecution of the work by non-union men. A strike at the Grand-mère pulp mills was abruptly terminated by the realization of the strikers that they were the victims of a misunderstanding regarding the readjustment of the pay system. A great fire at Montreal in January, 1901, devastated four acres in the centre of the whole-sale business section, the Board of Trade building being the chief loss. The total damage was estimated at \$4,000,000. In the early part of April disastrous floods occurred in the eastern provinces of Quebec and Ontario. During November, also, rumors were rife of a conspiracy for the overthrow of Canadian rule in the northwest and the establishment of an independent republic. The conspiracy ended, it is said, owing to the publication of the secrets of the "Order of the Midnight Sun," an organization which had for its purpose the instigation of a rebellion in Dawson. Yukon officials were in communication with the Ottawa administration and stated that arms and ammunition were secreted in great quantities, and that serious trouble might ensue.

Religious Questions.—The Laurier government in deference to mixed religious opinion did not accord state recognition to the services in memory of Queen Victoria, held in the Anglican Cathedral at Ottawa, lest such action should be misconstrued into an acknowledgment of a Canadian state church. The organized action among British Roman Catholics against King Edward's accession oath extended to Canada, where a petition was circulated through the city and province of Quebec demanding the abolition of "this vestige of hate and discord which tend to alienate the loyalty of a great many of his Majesty's subjects." A dignified debate in the Dominion Parliament resulted in the adoption of a resolution to memorialize King Edward to amend the coronation oath by eliminating therefrom all those expressions which are especially offensive to the religious beliefs of any subject of the British crown. In Manitoba (*q.v.*) the long-enduring troubles of the Roman Catholic schools were settled, but the perennial question of religious liberty came into notorious prominence over the Delpit marriage case.

The Delpit Marriage Case.—Mr. Delpit, a private secretary of Mr. Jetté, lieutenant-governor of Quebec, in May, 1893, married a Miss Cote, a Unitarian minister officiating. Three children were born of the union, and the contracting parties lived together until the husband invoked the powers of the ecclesiastical court of the province for an annulment of the marriage on the ground that, husband and wife being Roman Catholics, the ceremony was invalidated by the fact of its having been performed by a Protestant minister, who according to the Catholic church was not a competent officer. The ecclesiastical tribunal granted the plaintiff's request, which he sought to have confirmed by the civil court. The wife vigorously contested the action, among other allegations contending that at the time of the marriage she was a recognized Protestant; that Mr. Delpit had declared himself a non-Catholic; that a Unitarian minister was a competent officer to perform the ceremony, even if both the parties had been Roman Catholics; that the ecclesiastical court had no jurisdiction to inquire into the validity of the marriage; that she had contracted the marriage in good faith, relying on the plaintiff's declarations, and believing she was marrying before a competent officer, and that since the solemnization of the marriage up to the plaintiff's application to the ecclesiastical tribunal, the defendant had always been publicly recognized in the civil status of a legitimate wife. The judge in an exhaustive treatment of the history of the marriage law in Great Britain and in Canada before and after the confederation cited the statute of George II., which he stated had been a great victory for religious liberty, not only between Roman Catholics and Protestants, but also between Anglicans and other denominationalists. There was no doubt whatever that ministers of every denomination were authorized to solemnize marriage. They were authorized to keep registers in the province of Quebec, and if they were legally permitted to keep them they were assuredly entitled to use them. The power of the civil law was superior to any canonic law and the husband's action was dismissed with costs. Mr. Delpit made formal application for an appeal to a higher court. His contention

was upheld and emphasized a few days later by a powerful apostolic epistle to the faithful from the Roman Catholic archbishop of Montreal.

International Relations.—The seizure of the American barge *Ajax*, belonging to a Seattle firm, for a violation of the Canadian laws, in proceeding to Canadian waters to raise the wrecked steamer *Willamette*, was referred by the United States government to the British embassy on a complaint made by Mr. Gage, secretary of the treasury. The question hinged on the interpretation of the word "contiguous" in the agreement between the United States and Canada, which permits citizens of either country to conduct such operations in contiguous waters. The Montreal Corn Exchange passed a resolution for the adoption of retaliatory measures against German goods, after receiving information from the Dominion government that no attention had been paid to the remonstrances sent through the colonial office against the prohibitions on Canadian goods in German ports, and on the statement of the imperial government that no treaty was likely to be concluded for some time. International amenities were evinced by the interest aroused in the arrival at Montreal from Chicago of the first of the ocean-going grain-laden steamers, built for the purpose of direct communication between Chicago and European ports, the journey between Chicago and Hamburg to occupy twenty days.

CANALS. The canal work of 1901 was confined almost entirely to projects for the future; in neither America nor Europe was there much actual construction. Such of these projected enterprises as seem to command most attention are briefly summarized in the following paragraphs.

American Enterprises.—In the United States but little was heard during 1901 of the project for a deep waterway from the Great Lakes to the Atlantic Ocean, the active promotion of this scheme seeming to have been dropped after the preliminary report of the Board of Deep Waterway Engineers in 1900. In respect to the New York State canals improvement, which has occupied public attention for several years, the only new development of 1901 was the report of State Engineer Bond on the surveys of 1900. Briefly summarized, the New York legislature in 1900 appropriated the sum of \$200,000 to be expended by the State engineer in making surveys and estimates for a canal from Lake Erie to the Hudson River, large enough to accommodate boats of 150 feet length, 25 feet beam and 10 feet draft, with a cargo capacity of 1,000 tons. These surveys were made during 1900, and the report of their results was submitted to the governor on February 12, 1901. As this report represents the latest technical developments of the attempt of the people of New York State to place their canal system on a paying basis, it is given quite fully in abstract in a separate article. The report of the Isthmian Canal Commission in 1900 registered the latest technical developments of the various enterprises for a canal across Central America; the work of 1901 was almost wholly legislative work, with almost no definite results to make public at the end of the year. Turning now to the progress of canals which came up during 1901, the first thing of note which appears in this year's record was the report of the Board of Engineers of the United States Army in January recommending that no further consideration be given to the proposed 14 feet waterway from Lake Michigan to the Gulf of Mexico, by the way of the Des Plaines, Illinois and Mississippi rivers, since the 8 feet channel already provided for was ample to meet all the reasonable demands of traffic. During the year surveys were made under a \$10,000 appropriation act of the Massachusetts legislature for a canal across Cape Cod, but no report was made of the results. The Lake St. Clair-Lake Erie canal project was also revived during the year. This project calls for a canal $13\frac{1}{2}$ miles long through low-lying land, with the underlying rock more than 20 feet below the bottom of the deepest cut. A uniform depth of 21 feet is proposed, with a canal 156 feet wide on the surface and 72 feet wide on the bottom. This canal would enable vessels to avoid the fogs, shoals, and rapid current of the Detroit River, and would afford a straight course from the St. Clair flats canal, through Lake St. Clair to Lake Erie. The course would be unimpeded by locks, and a speed of 6 miles an hour could be maintained. The saving in distance by the canal would be 79 miles, between the foot of the St. Clair flats canal and an offing in Lake Erie. In time the saving would be six or seven hours. No estimate of cost is given, but the promoters of the canal claim that there would be a net saving of \$1,000,000 per year on the 40,000,000 tons of freight now annually passing through the Detroit River.

Foreign Enterprises.—In January, 1901, a canal improvement bill was before the Prussian Diet, calling for expenditures as follows: Midland canal, \$65,000,000; Berlin-Stettin canal, \$10,250,000; Oder tidewater canal, \$10,250,000; Havel-Spree canal, \$4,750,000. During the year the Neusil Saar canal also received attention from the German authorities. The Mosel rises in France and empties into the Rhine at Coblenz, after following a winding course of 319 miles. At its source the stream is 2,411 feet above sea level, and at its mouth it is 198 feet above this level. The proposed canal would be about 200 miles long and overcome a difference in

level of 340 feet by the construction of 42 needle dams. Including the expense of straightening about 40 miles of the River Saar, the estimated cost is \$18,000,000. In Hungary the Danube-Theiss and the Danube-Save canals were among the projected public works of 1901. The main branch of the proposed Danube-Theiss canal would connect Budapest with Osongrad, and be about 93 miles long, with a branch about 42 miles long from Felegyhaza to Szegedin. The proposed Danube-Save canal would run from Vukovar, on the Danube, to Saurac, on the Save, a distance of 35.6 miles. According to the United States consular reports the Hungarian ministry of commerce was also considering an Adriatic-Baltic water route. The route proposed contemplated joining the Oder and Danube by canal. It would start from Fiume, a seaport on the Adriatic; go up the River Kulpa and down the Save; then by an existing canal to the Danube; up the Danube to the province of Moravia, where a canal would be built to the Oder through a connecting valley; and then down the Oder to Stettin on the Baltic. In Russian territory, the record of the year included a canal connecting the Black and Caspian seas. The canal proposed would extend from Taganrog on the Sea of Azov to Astrakhan on the Caspian, by the way of the Volga. The proposed dimensions are: Width, 84 feet; depth, 22 feet; length, 530 miles. Another proposed Russian canal was the St. Petersburg-White Sea ship canal, 597 miles long, 200 feet wide and 31 feet deep. The route proposed is as follows: From the River Neva, across Lake Ladoga to the River Svir, and down this stream to Lake Onega; then due north through a dug canal to Seg Lake, and by canal to Vigozero Lake, and thence to the Gulf of Onega and the White Sea. During this year the Austrian government adopted a plan of canal improvements which contemplates the expenditure of over \$120,000,000 in 20 years' time on about 1,000 miles of canal. See AUSTRIA-HUNGARY, GERMANY, RUSSIA, and NICARAGUA CANAL.

CANALS IN NEW YORK STATE. The first step in the development of the present State canal system of New York was taken in 1788, when Elkanah Watson proposed improving the natural channels by way of the Mohawk River to Wood Creek, and thence through Oneida Lake to the Oswego River and to Lake Ontario. By 1796 this project was so far carried out as to afford navigation, for boats carrying 16 tons, from Schenectady westward 184 miles. The second advance was in 1808, when Simeon De Witt made a survey from the Hudson to Lake Erie, resulting in the passing of the canal law of 1816, which authorized the construction of the Erie and Champlain canals. These canals were commenced in 1817 and completed in 1825, the Lake Ontario-Oswego section being built in 1825-28. The waterway then constructed was 28 feet wide at the bottom, 40 feet wide at the surface and 4 feet deep; the locks were 90 feet long by 12 feet wide. The Champlain canal, however, was only 20 and 30 feet wide and 3 feet deep, with locks 75 x 10 feet. The third step was taken in 1835, when it was ordered that the Erie and Oswego canals should be enlarged to 52½ feet wide at the bottom, 70 feet wide at the surface, and 7 feet deep. The locks were made 110 feet long by 18 feet wide, allowing the passage of boats carrying 250 tons. This work was completed in 1862. The fourth step was suggested in 1878, when the State engineer proposed further enlargement on what has since been known as the Seymour plan; the chief object being to increase the depth to 8 feet by raising the banks or lowering the bottom as conditions might warrant. This step was further advanced in 1895, when the people of the State voted \$9,000,000 to increase the depth to 9 feet, in the waterway and 8 feet in the locks and aqueducts. This was the Seymour-Adams plan of 1895. The fifth stage of development is now begun by surveys and estimates made for a large canal, whose results were reported in 1901 and are outlined further on. At the same time the United States Deep Waterway Commission has prepared a report and estimates for a 21-foot and 30-foot ship canal through the State, at a cost of \$485,000 for surveys, etc. In March, 1899, Governor Roosevelt appointed an expert committee to advise as to the policy which the State should pursue towards its canals. This committee, on January 15, 1900, made a report recommending a barge canal, capable of passing boats 150 feet long, 25 feet wide, 10 feet draft and carrying 1,000 tons. The estimated cost of carrying out this project was \$62,000,000. The legislature adopted this report, and on April 12, 1900, it passed a law calling upon the State engineer for new surveys of specified portions of the route; and for plans and estimates for a barge canal having not less than 12 feet depth in the waterway, 11 feet in the locks and aqueducts, with locks not less than 310 feet long and 28 feet wide, with a capacity for passing the type of boat recommended by the committee of 1899. This survey is completed, \$200,000 having been appropriated for that purpose, and the report of the State engineer upon it was placed before the legislature in February, 1901. The findings of this report may be summarized as follows.

Lift Locks.—The ascent of the canal around the falls of the Mohawk River at Cohoes has been one of the most difficult problems to solve. State Engineer Adams

in 1894 advocated a mechanical lift lock at Cohoes and other localities on the Erie Canal, notably Lockport. Although mechanical lift locks of various types are in more or less successful operation in Europe, none have a lift exceeding 60 feet, while that necessary to overcome the falls at Cohoes would be 121.3 feet. Plans for such a mechanical lift lock at Lockport were made and submitted by Chauncey M. Dutton and adopted by the Canal Board, June 24, 1897. The failure of the \$9,000,000 appropriation to complete the contemplated improvement, however, stopped all progress on that work and the contract for the lock was never awarded. While the successful accomplishment of a mechanical lift at this spot is a very alluring proposition, considering what a saving of water would result, on the other hand failure of the machinery, which would involve closing the entire canal, would be a serious matter. State Engineer Bond, therefore, invited other engineers to submit plans. A hydraulic lock was proposed by the Buffalo Engineering Company, and one operated by electricity was submitted by Mr. Wm. R. Davis, chief bridge designer of the State engineer's office. For the purpose of comparison of cost, plans were also prepared for a series of concrete masonry locks which would overcome the height of the fall by a flight of four locks, each having 30.3 feet lift. These various designs were then submitted to a board of advisory engineers, consisting of Hon. Elnathan Sweet, ex-State engineer and surveyor, who was made chairman; George S. Morison and Professor William H. Burr, members of the Isthmian Canal Commission; Major Thos. W. Symons and Major Dan C. Kingman, of the Corps of Engineers, U. S. A. After carefully considering various types of mechanical lift locks and a comparison of the cost of the ordinary masonry locks, it was decided that a conservative policy demanded the use of the old and tried type rather than a comparatively new and experimental one. This decision was reached partially from the fact that timber gates of the miter type, built of solid beams of Pacific coast fir timber, have been found by practical experience on the Canadian canals to admit of the building of locks of 40 to 50 feet lift, when thought desirable. This type of gate has been in successful operation in Canada for many years, and there is nothing of the nature of an experiment in the adoption of such design. The highest lift used in the plan adopted by the board, however, is 40 feet, on the Lewiston-LaSalle line; on the Waterford line 33 feet is the highest lift. Later this same Advisory Board, with Mr. Alfred Noble substituted for Major Kingman, passed on other important details in connection with the project.

General Type of Canal.—The dimensions of the boats to be accommodated were named in the law, and it was decided that these could be met by a prism 75 feet wide on the bottom with slide slopes of 1 on 2 in earth section, and corresponding size in rock section, giving a ratio of prism to loaded boat of 4.75. In the river and lake channels the minimum width is 200 feet. Both the bottom and sides of the canal are to be thoroughly puddled wherever necessary; all embankments have a thick paddle core, all sloping sides are provided with well-constructed wash walls and all vertical walls are made of masonry. Guard locks are provided wherever required, and in the canal sections guard gates are provided at distances apart not exceeding ten miles, so that any section can be shut off for repairs whenever necessary. The single locks are 328 feet long between hollow quoins, 28 feet wide in the clear, and for lifts over 8 feet are fed through a culvert running parallel to the axis of the lock in the lower part of each wall. Smaller feed pipes discharge from these culverts into the lock and are placed from 15 to 20 feet apart. The opening and shutting of these culverts for filling and emptying is controlled by a valve operated by electricity. In the flight of locks, all of which are double, the culverts will be controlled by Fontaine lift valves, except the outlet of the lowest one, which will be controlled by a gate of the Stoney type. As a general thing, where enough fall can be obtained the power to operate all machinery will be electricity. This will also be applied to the opening and shutting of the gates, the lighting of the lock at night, and all other work incident to lockage. All boats are to be propelled by mechanical power and no towpath is provided. Throughout the canal a full complement of first-class new bridges was provided, and ample provision was made for a water supply sufficient to accommodate a traffic of 10,000,000 tons per annum.

Comparison of Routes.—The law also provided that comparative estimates should be made of the cost of various alternative routes, while separate estimates should be made of the cost of deepening the Oswego Canal to 9 feet and the Champlain Canal to 7 feet. Very extensive surveys and investigations have been made in accordance with this requirement, the most notable being the proposal to go via the Oswego River to Lake Ontario and thence through a short canal to Lake Erie, the proposal to make a slack water navigation in the Mohawk River and the diversion of the canal from the city of Rochester. A large part of the report is taken up with the comparison of the different routes; but the State engineer makes no recommendations, preferring to present such facts as will enable the State officials to judge for themselves. It is entirely plain, however, that it is vastly better to make

a system of slack-water navigation along the Mohawk and Seneca and Oswego rivers rather than attempt to enlarge the canal on its present location to the dimensions stated above. The advantage of the canalized river location is seen in the comparative estimate of cost given in the accompanying table. A still more important change is the proposal to use Lake Ontario as a part of the waterway, and it is found that by this means the cost of the work can be brought even below the estimate made by the Roosevelt advisory committee in 1899. The minimum cost of the proposed barge canal by this route is about \$50,000,000, not including the cost of the Champlain Canal improvement. A common objection to every proposition to make use of Lake Ontario is that time would be lost in locking boats down to that level and then locking them up to the height of Lake Erie. To investigate this, careful calculations were made by Hon. Elnathan Sweet, M. Am. Soc. C.E., and it was found that a round trip between Troy and Buffalo would take 35 to 40 hours less via the Lake route than via the Erie Canal route. In addition to this the maintenance will be much less on this route, as the total length of artificial canal and canalized river is much less. Against this is to be offset the necessity for using more seaworthy barges to make the lake trip than would be necessary on inland waters. If, however, the idea of Major Symons, the originator of the barge canal scheme, is realized, the canal would be chiefly used by vessels built to navigate either on the canal or the lakes, and so avoiding transfer charges at Buffalo. If this is correct, the inclusion of Lake Ontario would be no disadvantage.

Estimates for Completing the 9-Foot Deepening of the Erie Canal.—On the submission of the above report to Governor Odell, the State engineer was asked in addition to present estimates of the cost of completing the so-called \$9,000,000 improvement of the Erie Canal, authorized in 1895. Time was, of course, too brief to make new complete surveys and estimates before the adjournment of the legislature, and therefore use was made of the estimates made near the close of State Engineer Adams's term of office, by the engineers then in charge of the work of construction. To these figures additions have been made for the advance in the price of the materials for the added cost of labor due to the 8-hour law, and for the deterioration that has taken place in the canal during the years since the above estimates were made. On this basis it is estimated that the total present cost of completing the "nine million dollar improvement" on the Erie, Oswego, and Champlain canals will be \$19,797,828; and as the State engineer well says, when this amount of money has been expended the State will have on its hands "an old canal, repaired," whereas the estimates for the barge canal work are for "a modern canal, built according to the latest practice and of the highest standard known to modern engineering."

Estimated Cost of 1,000-ton Barge Canal from the Hudson River to Lake Erie (including 20 per cent. for Portions Done in Winter, assuming Present Canal will not be in Use from November 1 to June 1 During Construction).

*(Exclusive of Oswego Canal) Oswego to Buffalo.

CANARIES, or CANARY ISLANDS, a group of islands off the northwest coast of Africa, constituting a province of Spain, have an area of 2,808 square miles

and a population, according to the census of 1897, of 334,521. The principal products are potatoes, bananas, and tomatoes. The seat of government is Santa Cruz, in Teneriffe, but Las Palmas, in Grand Canary, has become the leading town of the islands. In March, 1901, an electric metre-gauge tramway was opened in Teneriffe, connecting the port of Santa Cruz with La Laguna, 5.6 miles distant. It is expected that the road will be prolonged to Orotava, about 21 miles beyond La Laguna. An electric tramway is projected to join the ports of Luz and Las Palmas in Grand Canary.

CANCER. Following Roswell Park, of Buffalo, N. Y., who claimed in 1900 that cancer is increasing rapidly in the United States, statisticians in different parts of the world reported in 1901 similar conditions in their own countries. The provincial board of health of Ontario, Canada, reports that the number of deaths from cancer in the province increased from 440 in 1886 to 1,041 in 1899. It is reported that in Moscow the number of cases of cancer had doubled since 1880, and Heymann states that the mortality from carcinoma in Russia is four times as great as in 1877. Professor Lewshin, of Moscow, has collected about \$150,000 for the establishment of proper sanitariums for the care of cancer patients in Russia. He states, incidentally, that in the past thirty years no material improvement has taken place in the treatment of the malady. James Braithwaite, of London, is authority for the theory that excess of salt is a cause of cancer. It may arise from a diet including too much meat. The other factors he considers are over-nourishment and some local irritant or stimulant, either mechanical or due to a micro-organism. He mentions the facts that Jewesses are seldom victims of cancer, and that savages who use no salt are exempt from cancer. He calls attention to the fact that all the domestic animals except the hog are subject to cancer, and that hogs alone receive no salt, while it is supplied to cattle, horses, and sheep.

Dr. Gaylord, of the University of Buffalo, believes that he has discovered the cause of cancer in an organism belonging to the protozoa. His experiments included the inoculation of seventy-two animals with this germ, with corroborative results. From his preliminary paper, published in May, 1901, satisfactory conclusions cannot be drawn, and it remains for subsequent and more detailed accounts to convince the scientific world, by which Gaylord's views are not yet accepted.

CANDIA. See CRETE.

CANNON, GEORGE Q., Mormon dignitary, died at Monterey, Cal., April 12, 1901. He was born in Liverpool, England, January 11, 1827, was converted to Mormonism in 1842, and two years later came to America, where he helped to found Salt Lake City. Later he went as a missionary to California and Hawaii, translated the Mormon bible into the Hawaiian language, and returned, after a tour of Europe, to serve as private secretary to Brigham Young. In 1857 Mr. Cannon became an apostle in his church, and soon after a leader, fighting for his faith against the most bitter attacks from all parts of the country. He served as delegate in Congress from 1872 to 1880, when he was deprived of his seat because of his polygamy. Largely through the influence of Mr. Cannon, who counseled a separation of the Mormon Church from politics, Utah was admitted to Statehood.

CANOEING. The great event of the year is the annual camp of the American Canoe Association and the championships contested for at that time. The meet of 1901 was the twenty-second, and it was held on Halfmoon Island—one of the Thousand Islands—August 9 to 23. Many old-timers, such as E. B. Edwards, C. Bowyer, Vaux, and Paul Butler, together with members from the Northern, Atlantic, Central, and Eastern divisions of the association, were present. The following is a summary of the contests: Paddling and sailing combined, $\frac{1}{2}$ mile alternately, total 3 miles, start to be made under paddle; F. C. Moore, first; Geo. McTaggart, second. Paddling, $\frac{1}{2}$ mile straightaway: G. W. McTaggart, first; F. F. Dorsey, second. Sailing, $4\frac{1}{2}$ miles, time limit 2 hours: F. F. Dorsey, first; G. W. McTaggart, second. Trophy, sailing, 9 miles: F. F. Dorsey, first; Paul Butler, second. Dolphin, sailing trophy and British Canoe Association sailing trophy, $7\frac{1}{2}$ miles: F. C. Moore, first; G. W. McTaggart, second. Open canoe, $1\frac{1}{2}$ miles: G. W. McTaggart, first; Hyam Hoyt, second. Trophy paddling, double blades, 1 mile straightaway: E. J. Minnett, Toronto, first; R. N. Brown, Toronto, second. Novice paddling, $\frac{1}{2}$ mile with turn, single blades: R. Moody, Toronto, first; A. G. Mather, Medford, Mass., second. Open canoes, single, $\frac{1}{2}$ mile with turn, single blades: E. J. Minnett, Toronto, first; A. G. Mather, Medford, Mass., second. Tandem, $\frac{1}{2}$ mile with turn, open canoes, single blades: E. J. Minnett and A. McNichol, of Toronto, first; A. G. Mather and R. Hunter, of Medford, Mass., second. Decked or open canoes, single, paddling, $\frac{1}{2}$ mile with turn, double blades: E. J. Minnett, Toronto, first; A. McNichol, Toronto, second. Rescue race, $\frac{1}{4}$ mile straightaway: R. H. Britton and Parmenter, Gananoque, first; E. J. Minnett and A. McNichol, Toronto, second. Tandem, double blades, $\frac{1}{2}$ mile with turn, open canoes: E. J. Minnett and A. McNichol, Toronto, first; R. N. Brown and J. J. Vaughan, Toronto, second. Fours, double blades, $\frac{1}{2}$

mile straightaway: E. J. Minnett, R. N. Brown, A. McNichol, and J. J. Vaughan, of Toronto, first; R. H. Britton, A. G. Mather, W. Gallow, and R. Moody, of Toronto, second. Fours, $\frac{1}{2}$ mile straightaway, single blades, open canoes: E. R. McNeill, A. L. Lynch, R. H. Britton, and C. Eastmond, of Kingston, second; R. N. Brown, J. J. Vaughan, A. McNichol, and E. J. Minnett, of Toronto, third. Tail-end race, $\frac{1}{4}$ mile straightaway: R. Parmenter, first; G. W. Begg, Toronto, second—10 starters. Relay race, open canoes, single blades, $1\frac{1}{2}$ miles over sailing course, three men from each club or division: E. J. Minnett, J. J. Vaughan, and A. McNichol, first; R. N. Brown, R. Moody, and A. G. Mather, second. Mixed tandem, $\frac{1}{4}$ mile straightaway: Miss M. H. Britton and R. H. Britton, of Gananoque, first; Mrs. J. B. Taylor and A. G. Mather, second; Miss English and R. Hunter, third. Hurry-scurry, run, swim, and paddle, standing up, open canoes: R. Parmenter, Gananoque, first; Ralph Britton, Gananoque, second. Tournament: J. McD. Mowat and R. Parmenter, first; J. Howard and A. G. Mather, second. War canoes, championship of America, 1 mile straightaway: Won by the Toronto Canoe Club. War canoe tug-of-war, one-minute heats, best two out of three: Won by Y. M. C. A., of Brockville; Toronto Canoe Club, second. Northern Division championship: Y. M. C. A. Athletic Club, of Brockville, first; Toronto Canoe Club, second. Record race: G. W. McTaggart, first; F. F. Dorsey, second.

CAPE COLONY, officially known as the Cape of Good Hope Colony, is the southernmost of the British possessions in South Africa. The capital is Cape Town.

Area, Population, and Education.—The area of Cape Colony proper, together with its various accessions from 1875, when Griqualand was annexed, to 1895, when British Bechuanaland was incorporated, is estimated at 276,775 square miles. Along the southern coast the soil is well adapted for the cultivation of grain and vines, but on the Great Karroo of the interior and in the highlands of the north, the nature of the ground is such as to make it suitable only for grazing and sheep-farming. According to the census of 1891, the population of the colony, exclusive of Pondoland and Bechuanaland, was 1,527,224, of which number the white inhabitants comprised 376,987. Of the whites about three-fifths were of Dutch descent, massed for the most part in the western districts, while the British element predominated in the country toward the east. The colored population is made up of Malays and a mixture of South African races. The inhabitants of Pondoland and Bechuanaland number about 275,000. The leading religious denomination is the Dutch Reformed Church, which embraces about one-fifth of all the inhabitants. Next in the order of numerical importance are the Anglicans, Wesleyans and other Methodists, Independents, Presbyterians, Lutherans, Roman Catholics, and Moravians. Of the native population, a very large proportion, amounting in all probably to 70 per cent., is without any religious faith. Education is not compulsory. In 1900 there were 2,613 schools, partly supported by the government, with an attendance of 110,483 children, of whom about two-fifths were of European descent. There are seven colleges with an enrollment of 650 students and a central university, which as yet is merely an examining body. In 1900 the expenditure for education was £272,214. There were 125 public libraries in 1899, and about 90 newspapers and periodicals.

Government and Finance.—By the constitution of 1872, the executive authority is placed in a governor appointed by the British crown and assisted in his duties by a council of ministers, six in number, responsible to the Colonial parliament. The law-making power is vested in a legislative council of 23 members, elected for a period of seven years, and a house of assembly of 95 members, chosen for five years. There is a small property qualification for the suffrage, but for membership in the legislative council, the possession of real estate to the amount of £2,000 or of personal property to double the value, is required. In 1901 the governor was Sir Walter F. Hely-Hutchinson (*q.v.*). As a result of the Boer war, Cape Colony with the rest of the British possessions in South Africa, has been placed under the ultimate supervision of a high commissioner, at present Sir Alfred Milner (*q.v.*). The change has been attended by a noticeable increase in the influence of the executive, necessitated in great measure by the conditions of virtual war which for some time during 1901 prevailed in the colony. The legal system is based on the old Roman-Dutch law. The highest tribunal is the Supreme Court at Cape Town, composed of a chief justice and eight associate justices. There are in addition circuit courts, assigned to the eastern, southern, and western districts, permanent and special magistrates' courts, and local justices of the peace. Military and naval contingents are regularly maintained by the Imperial government for the defense of the colony. Local military organizations, available for service in case of emergency, are the Cape Mounted Riflemen, with a normal strength of about 1,000; the Cape Police, consisting of 2,000 officers and men, and various volunteer organizations, approaching in 1898 close to 7,000 men. During 1901 naturally a much larger proportion of the inhabitants were under arms, and in the beginning of the year, when the invading Boer commandos were most active, the strength of the mounted riflemen, police, and volunteers was estimated at 12,000.

The principal sources of revenue in the order of importance are the railways, posts and telegraphs, taxation, and the public domain; the chief items of expenditure are the railways, the interest on the public debt, the penal institutions, and defense. In 1899 the revenue amounted to £8,781,212, and the expenditures to £8,190,124; in 1900 the total income was £6,565,752, a sum considerably smaller than the disbursements, which were £7,773,230. The large decrease in the revenue for 1900 is more than accounted for by the fact that the receipts for the previous year had been swelled by a loan of £2,317,000. Nearly the whole of the public debt which, at the end of 1900, amounted to £31,097,825, has been contracted in the construction of public works, the amount spent on the railways up to January 1, 1901, being £21,842,216.

Industries.—The principal industries are the rearing of sheep, cattle, and ostriches, agriculture, and mining. Farming and cattle raising are for the most part carried on by the Dutch population; mining and whatever manufacturing there is, are in the hands of the British. On the large cattle-farms of the interior and the north, covering at a rough estimate nearly one hundred million acres, there were towards the end of 1898 about 1,260,000 sheep, 5,572,793 Angora and other goats, 1,076,774 head of cattle, 387,824 horses, 260,672 ostriches, and 245,947 swine. In the same year there were produced 35,179,900 pounds of wool, 6,707,879 pounds of mohair, and 287,167 pounds of ostrich feathers. Statistics for subsequent years are not available owing to the continuance of the struggle with the Boers, but estimates tend to show that the grazing industry, more perhaps than any other, has suffered from the persistence of hostilities. These estimates are confirmed by figures showing that the export of animal products, including wool, feathers, hides and skins, declined from about £4,200,000 in 1899 to a little over £2,635,000 in 1900. The decrease of production is easily accounted for, partly by the fact that a large proportion of the adult male population has been diverted from their regular occupations to military service, and partly by the presence of marauding bands of Boers in the western districts of the colony. The principal minerals worked in Cape Colony are diamonds, copper, and coal; but there also occur manganese, lead, iron, zincblende, and gold. The latter appears as by far the most important item in the list of exports, but practically all of it is derived from the Transvaal. The diamond fields are chiefly at Kimberly, in Griqualand West, 647 miles by rail from Cape Town. Before the outbreak of war Cape Colony yielded about 98 per cent. of the world's annual output in diamonds. The total value of the precious stones exported between 1867 and 1899 has been estimated at about £92,000,000, and the average production for the last five years of the period was about £4,500,000. The value of the diamonds exported in 1900 was only £3,433,636. The output of coal was 208,655 tons in 1899, and 198,451 tons in 1900. Among agricultural products, maize and wheat take the leading place. In 1898 the maize crop amounted to 2,857,809 bushels, and the wheat crop to 2,220,747 bushels. The production of minor cereals for the same year was: Oats, 1,810,611 bushels; barley, 830,730 bushels; Kafir corn, about 2,000,000 bushels; rye, 304,491 bushels; and oat-straw, about 225,000,000 pounds. In the favorable soil of the coast region there were raised 83,000,000 vine stocks, which yielded 4,826,432 gallons of wine and 1,107,344 gallons of brandy. Many varieties of fruit, including the apple, apricot, fig, lemon, orange, pear, peach, and plum are raised in considerable quantities.

Communications.—In Cape Colony proper there are about 8,000 miles of wagon roads. Three main lines of railway setting out from Cape Town, Port Elizabeth, and East London on the southern coast, traverse the colony from north to south. At Springfontein a few miles into the Orange River Colony, the two eastern roads merge into one, while the western line skirts the borders of the two former Boer republics, and runs north to form part of the projected Cape-to-Cairo Railway (*q.v.*). Branching off from the three main lines are numerous spurs running in all directions. On January 1, 1901, there were 2,911 miles of railway in the colony. Of this amount, 2,089 miles were owned and operated by the government, 653 miles were private property, but were worked by the government, and 235 miles were both privately owned and operated. In November, 1901, five small lines, aggregating 582 miles in all, were in course of construction. The government railways have been built at a cost of nearly £10,200 per mile. In 1898 the gross earnings were £2,904,000, and the expenses £2,012,400; in 1899 the figures were £2,792,975 for receipts, and £1,180,312 for disbursements. For the year 1900 the returns showed a profit of 6¼ per cent. on the capital invested. At the end of 1899 there were 7,360 miles of telegraph line in the colony, with 22,000 miles of wire; by the end of 1900 the length of line had increased to 7,441 miles, and the miles of wire to 22,654. The net revenue in 1898 was £10,511, while operations in the following year resulted in a loss of £8,609. At the end of 1898 the post-offices in the colony numbered 942, and the postal system in that year was worked at a loss of £1,496.

History for 1901.—An account of the military operations in Cape Colony during the year will be found under TRANSVAAL. Political conditions in the colony were entirely determined by the attitude of the Afrikaner population toward the Dutch

of the Vaal and Orange River Colonies, and to the Cape government. In 1900 party lines had been sharply drawn on the question of the Treason Bill, the opposition in the parliament had carried on a violent propaganda against the measures of the ministry, in defense of the liberties of the subject as they themselves claimed, or in the interests of the Boers, as was asserted by British sympathizers, and when the legislature was dissolved in October, all the members of the Afrikaner Bond were in open discontent with the government, and some in active rebellion. The agitation was not confined to parliament. During the last two months of the year the greater part of the Dutch press engaged in a sympathetic campaign of argument and villification against the civil and military authorities, and the charges adduced by the press were reiterated at the Afrikaner Congress which assembled at Worcester on December 6, 1900, and demanded the immediate cessation of war and the restoration of independence for the Boer republics. With the revival of Boer activity in the field in the very last days of the year, and the appearance of hostile commandos within the borders of the colony, the danger of a rising among the Cape Dutch seemed imminent. No movement, however, of sufficient proportions to be termed an insurrection occurred in 1901, although undoubtedly large numbers of colonists joined the Boer forces as individuals. What rendered the position of the British authorities difficult throughout the year was not open resistance by force of arms, but the silent ill-will of a hostile population expressing itself in effective aid and comfort lent to the enemy.

This was the situation at the beginning of 1901 as described with considerable detail and some animus in a report by Lord Alfred Milner, dated at Cape Town on February 6, and published in a parliamentary blue book of April 17. While recognizing, however, the full gravity of the existing state of things, Lord Milner was inclined to take a hopeful view as to the ultimate issue of affairs. He pointed out that the bulk of the population, though probably in sympathy with the Boers, were weary of the struggle; that their aid was evoked only by the presence of armed bands among them, and that only the extremists could view with dissatisfaction the approach of a time when the burdensome requisitions of food, horses, and cattle exacted by the Boer commandos should come to an end. Lord Milner stated that he had no fear of an outbreak among the Cape Dutch for three reasons. (1) The abortive attempt at rebellion which occurred in 1900 had demonstrated the futility of any insurrectionary movement; (2) the large proportion of unruly spirits, from whom the government in the beginning might have expected trouble, had already gone to join the guerrilla bands of the Orange River Colony and the Transvaal; (3) owing to the precautionary measures of the authorities, the amount of arms and ammunition in the hands of the farmers had been greatly reduced. To restore order in the disturbed districts and to preserve order wherever it seemed to be threatened, Lord Milner recommended severity. "Personally," he wrote, "I am of the opinion, which I have always held, that reasonable strictness is the proper attitude in the presence of a grave national danger, and that exceptional regulations for a time of invasion, the necessity of which every man of sense can understand if clearly explained and firmly adhered to, are not only incompatible with, but actually conducive to, the avoidance of injustice and cruelty."

By severity Lord Milner undoubtedly meant the stricter administration of martial law, and the bringing to trial of persons guilty of sedition or insurrection, under the terms of the Treason Bill of 1900. Martial law prevailed in different districts of the colony for varying periods during the early part of the year, but from the consensus of reports it would seem that the desire for the proclamation of martial law over the entire colony was common among the large body of British subjects and among a small but influential minority of Afrikaners. Though not proclaimed as soon as had been expected, martial law was initiated in October, 1901, but for nearly half a year before that date the ordinary process of government had been dispensed with. As the time approached for the reassembling of parliament it became evident that, as the ministry advised the governor, such an event would be not only inexpedient but impracticable. After the last day of June, the government was carried on without regard for parliamentary sanction. The ordinary expenses of administration were met by customs and taxes raised on ministerial warrants. Mr. Joseph Chamberlain, in the House of Commons, admitted that parliamentary government was practically in abeyance in Cape Colony, but defended the course of the ministry as necessitated by the extreme gravity of the situation, and remarked that if the governor or his advisers should at any time be brought to account for transgressing their constitutional power, it would be the duty of the Imperial parliament to meet the emergency by passing an act of indemnity.

Under the new law of treason and the common-law, proceedings were brought during the year against a number of editors and public speakers as well as against men who had actually levied war on the government. The death penalty was inflicted in a number of cases, while sentences of perpetual banishment and of penal servitude for long terms were common. The most prominent cases were those of Malan,

editor of *Ons Land*, who was charged in January with libel against General French, perpetrated in publishing scandalous falsehoods reflecting on the character of the general and the troops under his command. At about the same time the publication of the *South African News* was prohibited. In April the editors of *Ons Land*, the *South African News*, *Het Oozen*, and the *Worcester Advertiser*, were condemned to terms of imprisonment ranging from six to twelve months. Merriman, one of the most prominent leaders of the Bond was taken into custody during the last week in August, but the case that evoked most attention was that of Commandant Lotter, a British subject of Cape Colony, who was taken prisoner near Petersburg, with his entire commando, brought to trial, condemned, and shot.

In January the bubonic plague broke out in Cape Town and spread with great rapidity, especially among the colored inhabitants. The Kaffirs were panic-stricken, and abandoned the city in large numbers, seriously delaying business in the town and the harbor. The epidemic attained its height in the latter part of August, when about 800 cases had been reported, of which 377 had terminated fatally.

CAPE-TO-CAIRO RAILWAY AND TELEGRAPH. This project of Mr. Cecil Rhodes for rail communication between northern and southern Africa made slow progress during 1901. The line is being carried northward from Buluwayo, which is 1,360 miles from Cape Town, but most of the construction in 1901 was on branch lines to the mining districts of Rhodesia (*q.v.*). The Cape-to-Cairo telegraph line, however, which, like the railway, is under British auspices, made notable advancement during the year. This line, starting at Umtali, in Mashonaland, which town has wire communication with Cape Town, in 1900 had reached Abercorn at the southern end of Lake Tanganyika, passing through Tete, Blantyre, Karonga, and Zomba. In December, 1901, it was announced that the line had been extended to Ujiji on the eastern shore of Lake Tanganyika in German East Africa. It is expected that Ujiji will be an important junction with the German East African system from Dar-es-Salaam. The English line on reaching the northern end of Lake Tanganyika will be carried northeast to Victoria Nyanza, whence telegraphic communication with the coast already exists.

CAPE VERDE ISLANDS, a group of 14 islands belonging to Portugal and lying 350 miles west of Cape Verde, have a total area of 1,480 square miles, and about 115,000 inhabitants. The population is a mixed race of descendants of negroes from Guinea and Portuguese settlers, the negro element predominating. The colony is administered by a governor appointed by the crown. The capital is Praia. The chief products are coffee, tamarinds, drugs, millet, and sugar. The estimated revenue for the fiscal year 1900 was 364,129 milreis (milreis equals \$1.08); estimated expenditure, 319,941 milreis; imports (1898), 1,558,047 milreis; exports, 194,608 milreis. About the first of March, 1901, the Eastern Telegraph Company connected St. Vincent with Falmouth, England, by cable operated in connection with the Cape-St. Helena line.

CARDINALS. The Sacred College, as the body of cardinals—bishops, priests, and deacons—in the Roman Catholic Church is known, is composed of the electors and advisers of the Pope, to whom alone the members are second in dignity. (For deaths and consecrations in the college of cardinals during the year 1901, see **ROMAN CATHOLIC CHURCH.**) The names and dates of consecration are given in the subjoined list:

Cardinal bishops: A. Agliardi (1896); Mario Mocenni (1893); L. M. Parocchi (1877); D. S. S. Oreglia (1873); S. Vannutelli (1887).

Cardinal priests: B. Bacilieri (1901); G. Boschi (1901); A. Capecelatro (1885); G. B. Casali del Drago (1899); S. Casanas (1895); Fr. di Paolo Cassetta (1899); P. G. M. Cellesia (1884); Agostino Ciasca (1899); Pierre H. Coullie (1897); S. Cretoni (1896); D. M. Dell'Olio (1901); Angelo Di Pietro (1893); A. A. Ferrari (1894); D. Ferrata (1896); J. Franciscanova de B. (1899); C. Gennarvi (1901); James Gibbons (1886); P. L. Goossens (1889); G. M. Gotti (1895); J. Herrera (1897); George Kopp (1893); G. M. J. Laboure (1897); B. M. Langenieux (1886); Victor L. Lecot (1893); M. Ledochowski (1875); Michael Logue (1893); A. Manara (1887); S. Martinelli (1901); G. A. Masella (1887); Fr. D. Mathieu (1899); James Missia (1899); P. F. Moran (1885); Adolphe Perraud (1893); Gennaro Portanova (1899); G. Prisco (1896); K. G. Puzyna (1901); M. Rampolla (1887); Pietro Respighi (1899); A. Riboldi (1901); F. M. Richard (1899); Agostino Richelmy (1899); C. M. Sanchi (1894); Giuseppe Sarto (1893); Francis Satolli (1895); L. Schlauch (1893); L. Shrbensky (1901); D. Svampa (1894); V. Vannutelli (1889); Claudius Vaszary (1893); Herbert Vaughan (1893); A. S. Zabarella (1901).

Cardinal deacons: F. Cavagnis (1901); F. S. Della Volpe (1899); L. Macchi (1889); R. Pierotti (1896); F. Segna (1894); A. Steinhuber (1893); G. C. Vives y Tuto (1899); L. Tripepi (1901).

CARLISLE, JOHN GRIFFIN, ex-secretary of the United States treasury and prominent Democratic leader, was born in Campbell County, Ky., September 5,

1835, and received a common school education. After studying law privately he was admitted to the bar in 1858, and soon afterwards was elected to the State legislature, where he served several terms. From 1866 to 1871 he was a state senator; was lieutenant-governor, 1871-75; and a member of Congress from 1877 to 1889, being speaker of the House during the last six years of that period. Under the second Cleveland administration (1893-97) he was secretary of the treasury. Upon the completion of his term he went to New York City to practice law, and during 1901 had charge of important Cuban and Porto Rican tariff claims cases against the United States.

CARNEGIE, ANDREW, retired American steel manufacturer and well-known philanthropist, disposed of gifts aggregating \$40,000,000 during 1901. He was born at Dunfermline, Scotland, November 25, 1837, and coming to the United States in 1848, began his career as a weaver's assistant. Upon the death of his father in 1851 he became the sole support of his mother, earning soon after, as a telegrapher, \$25 a month. During the Civil War he acted as superintendent of military railroads and telegraph lines, winning favorable notice by his energy; and when he organized the Keystone Bridge Company, to replace with iron structures the old wooden bridges used by the railroads, he pushed it to a quick success. His commercial history from that date coincides with the remarkable development of the steel industry in the United States, and ends with his retirement from business upon the formation of the United States Steel Corporation in 1901. Mr. Carnegie characteristically announced his retirement from active business by sending a letter to his former associates and employees at Pittsburg, offering them a fund of \$5,000,000, four-fifths of which was to be devoted to pensions for retired and disabled workers in the Carnegie mills. About the same time he made the statement, now so frequently quoted, that it is a disgrace for a man to die rich, since wealth is, properly considered, only a trust-fund temporarily put into a man's keeping for the public good. As an illustration of this doctrine, he gave in March, 1901, \$5,200,000 for the extension of the public library system of New York City, and soon after he offered to St. Louis \$1,000,000 for a new library building. Following close upon these gifts came the announcement that he had given \$10,000,000 to the universities of Scotland, one-half of which was to be devoted to scientific research and scholarships, and the remainder to the payment of the fees of poor Scotch students seeking a university training. In December it was announced that he had offered \$10,000,000 for the establishment at Washington of a national institution to be devoted to higher research work. This offer was accepted and the new institution organized. (See the following article.) To Pittsburg Mr. Carnegie had, before his retirement, given, in the form of libraries and schools, more than \$7,000,000, and during 1901 this was increased by \$1,000,000 out of the \$5,000,000 before mentioned. But beyond this he promised to the city of Pittsburg money sufficient to erect and endow the most elaborate and advanced technical school in the world. Rumor fixes the amount of this offer at \$25,000,000. Public comment on these immense benefactions is unanimous in praising Mr. Carnegie's discretion and wisdom in disposing his gifts. It is fair to assume that before the end of his great philanthropy is reached, with \$400,000,000 at his command, he will set a standard in wise giving that will bring good to millions; and his gospel of wealth is in a fair way to be regarded more seriously than as the notion of an eccentric individual.

CARNEGIE INSTITUTION AT WASHINGTON FOR THE ENDOWMENT OF RESEARCH. In December, 1901, Mr. Andrew Carnegie made known to President Roosevelt his desire to make a donation of \$10,000,000 for the foundation of a national institution of high learning. The gift was similar in its terms to that made by James Smithson in founding the Smithsonian Institution, and its purpose is similar in that the new institution is founded to supplement the work of existing institutions and not to compete with them. The new foundation is not a university in an ordinary sense of the term, for it is to confer no degrees and make no scholastic degree or title a prerequisite to a participation in the advantages which it offers. The character of the foundation was determined upon only after extended conferences with the leading educators of the country, chief among whom were ex-President D. C. Gilman, of Johns Hopkins University; President Hadley, of Yale; President Eliot, of Harvard; President Butler, of Columbia; Abram S. Hewitt, of the Cooper Union, and others.

For some years past the leading educators of the country, especially those prominent in the deliberations of the National Educational Association, have renewed the discussion concerning the foundation of a national university at Washington. In accordance with the recommendations made by these gentlemen, Congress passed, on March 31, 1901, an act throwing open the governmental collection of documents and scientific material for the use of resident students and educational institutions throughout the country; and on May 20, 1901, incorporated the Washington Memorial Institution for the promotion of science and literature, the function of

which was to assume general direction of such research study. The institution was to work in cooperation with other educational and scientific institutions throughout the country, and especially with the Smithsonian Institution and the Washington Academy of Science. The general supervisory work of the institute was to have been begun in the fall of 1901 under the presidency of Dr. Daniel C. Gilman. Prompted by the proposed plan of advanced work, Mr. Carnegie made the offer of the large endowment fund, which rendered necessary a much broader organization than had been contemplated. Late in December a very representative board of trustees was selected, as follows: John Hay, secretary of state; William P. Frye, president *pro tem.* of the Senate; David B. Henderson, speaker of the House of Representatives; S. P. Langley, secretary of the Smithsonian Institution; John S. Billings, of New York; William M. Frew, of Pittsburg; Lyman J. Gage, of Illinois; Daniel C. Gilman, of Baltimore; Abram S. Hewitt, of New York; Henry L. Higginson, of Boston; Henry Hitchcock, of St. Louis; Charles L. Hutchinson, of Chicago; William Lindsay, of Kentucky; Wayne MacVeagh, of Philadelphia; D. O. Mills, of New York; S. Weir Mitchell, of Philadelphia; William W. Morrow, of San Francisco; Elihu Root, of New York; Charles D. Wolcott, director of the Geological Survey; Carroll D. Wright, commissioner of labor; President Roosevelt; Justice Edward D. White; Senator John C. Spooner; Ambassador Andrew D. White, and Mayor Seth Low, of New York.

Among the purposes of the foundation that are specified in the deed of gift are the following:

First—To promote original research, paying great attention thereto as one of the most important of all departments.

Second—To discover the exceptional man in every department of study whenever and wherever found, inside or outside of schools, and enable him to make the work for which he seems specially designed his life work.

Third—To increase facilities for higher education.

Fourth—To increase the efficiency of the universities and other institutions of learning throughout the country, by utilizing and adding to their existing facilities and aiding teachers in the various institutions for experimental and other work, in these institutions as far as advisable.

Fifth—To enable such students as may find Washington the best point for their special studies to enjoy the advantages of the museums, libraries, laboratories, observatory, meteorological, piscicultural, and forestry schools and kindred institutions of the several departments of the government.

Sixth—To insure the prompt publication and distribution of the results of scientific investigation, a field considered highly important.

It is not proposed for the present to erect any extensive buildings; a building formerly used as a private dwelling will for the present serve as administrative headquarters.

CAROLINE AMELIA, Princess of Schleswig-Holstein-Sonderburg-Augustenburg, member of the German royal family, died at Cairo, Egypt, May 3, 1901. She was born at Augustenburg, January 15, 1826, the daughter of Duke Christian August, of Schleswig-Holstein, and Louisa Sophia, Countess of Danneskjöld Samsøe. Princess Amelia was the elder sister of Prince Christian, of Schleswig-Holstein.

CAROLINE ISLANDS, a group of islands in the Pacific, lying between the Philippines and the Marshall Islands, to the north of New Guinea, 526 in number, have a total area of about 800 square miles and a population estimated at 42,700. They constitute a part of the island possessions purchased by Germany from Spain in February, 1899. They form some 26 groups, of which the most important are the Pelews, Yap, Uluthi, Uleai, Namonuito, Rug, Mortlocks, Ponape, and Kusaie. Rug has about 15,000 inhabitants and Ponape 4,000. The inhabitants are Micronesian, with admixtures of the Negrito, Papuan, Japanese, and Chinese races. They are governed as a part of the German New Guinea protectorate, with local capitals at Yap and Ponape. The products are bread fruit, cocoanut, oranges, cloves, sugarcane, etc. Agriculture is rude, and the commerce, which is controlled by the German Jaulit Company, is small. The company has stations on the more important islands. Germany appropriated 370,000 marks for the expenditures in 1901. American missionaries have stations on many of the islands, and the inhabitants have largely been converted to Christianity.

CARTE, D'OYLY (Richard Doyle McCarthy), British impressario and theatrical manager, died in London, April 3, 1901. He was born in 1844 in London, and was educated at the University College School and London University. He then began to write songs and minor operettas, and established a concert agency of some importance. In 1870 he began his career as a producer of light opera, and soon effected the partnership of W. S. Gilbert and Sir Arthur Sullivan, and presented *The Sorcerer* in 1887. Following this, he produced *H. M. S. Pinafore*, *The Pirates*

of *Pensance*, *Patience*, *Iolanthe*, *Princess Ida*, *The Mikado*, and other compositions of the joint authors. He built the Savoy theatre in London, which was opened with the first production of *Patience*. D'Oyly Carte also built the Royal English Opera House, now the Palace Variety, for the special production of Sullivan's one grand opera, *Ivanhoe*. He presented some of the Gilbert and Sullivan operettas in New York City.

CASABIANCA, MANUEL, Colombian general and politician, died in Bogotá early in June, 1901. He was born in the Dutch colony of Curaçao in 1843, and fought in the Colombian army through several revolutions. General Casabianca was for many years a prominent military and political figure in his adopted country, and held various important offices under different Colombian presidents.

CASCAJARES Y AZARA, ANTONIO MARIA, cardinal, died at Callahora, Spain, July 27, 1901. He was born at Colanda, in the archdiocese of Saragossa, May 2, 1834, and was created a cardinal priest of the Roman Catholic Church in 1895. Cardinal Cascajares y Azara was one of the most scholarly of the Spanish clergy, and it was largely due to his efforts that the papal university at Valladolid was established and opened in 1894.

CASSATT, ALEXANDER JOHNSTON, president of the Pennsylvania Railroad, in 1901, was prominent in the adoption of plans for an improved approach to New York City for his road, the plans providing for a tunnel under the North River from Jersey City, an underground station in the metropolis, and a tunnel under the East River, connecting with the Long Island Railroad. Born at Pittsburg, December 8, 1839, and educated at the University of Heidelberg and at the Rensselaer Polytechnic Institute, Troy, N. Y., Mr. Cassatt began his career as a railway surveyor in Georgia, 1859-61. Entering the service of the Pennsylvania Railroad as rodman in 1861, he rose steadily, and by 1871 had become superintendent of the system. In 1874 he was chosen third vice-president, and in 1880 first vice-president; in the following year he resigned. From 1883 to 1899 he was a director of the road, and in the latter year became president.

CASTLE, EGERTON, the English romantic novelist, who, with his wife, Agnes Castle, published in 1901 *The Secret Orchard*, was born in London, March 12, 1858, and was educated in the universities of Paris and Glasgow. After a short experience in the British Army, he joined the staff of the *Saturday Review* (1885), where he remained until 1894. Among the books published by him are: *Schools and Masters of Fence* (1884); *Consequences* (1891); *English Book-Plates* (1892); *The Light of Searthey, A Romance* (1895); and, with Agnes Castle, *The Pride of Jennico* (1898) and *The Bath Comedy* (1899). Mr. Castle is the publisher and part owner of the *Liverpool Mercury*.

CASTRO, General CIPRIANO, president of Venezuela, whose government in 1901 was beset by revolutionary movements and international complications, was born near Capaolio about 1862. Castro, who is well educated, first came into prominence under General Crespo, as one of the leaders of the Liberal party, though he refused to accept a place in Crespo's cabinet when the latter was made president. In 1899 he headed a revolution against the administration of President Andrade, and in the fall of that year became provisional president. In 1900 he was formally elected to the presidency. See VENEZUELA, paragraph on History.

CATHOLIC CHURCH. See ROMAN CATHOLIC CHURCH.

CATHOLIC COLLEGES OF THE UNITED STATES, CONFERENCE OF THE. The third annual conference was held at Chicago, April 10-12, 1901, delegates, representing 70 colleges, being present. The report of the secretary shows that 1,000,000 students are being educated in Catholic schools, of which 30,000 are in institutions of higher learning. Parochial schools have multiplied rapidly in the past few years; in the resolutions of the conference emphasis is laid upon the necessity of developing the high school, as a connecting link with the Catholic college, to whose growth the church is paying great attention, the crown of the system being the Catholic University (*q.v.*) at Washington. The address of the presiding officer, Rt. Rev. Mgr. Thomas J. Conaty, D.D., rector of the Catholic University, dealt largely with the Catholic opposition to the unification of education under state control, as "a mighty machine of secularized instruction." Many other questions affecting Catholic interests were discussed. President, Rt. Rev. Mgr. Conaty, D.D.

CATHOLIC SUMMER SCHOOL OF AMERICA, at Cliff Haven, N. Y., on Lake Champlain; decennial session held July 7 to September 6, 1901. The summer school is modeled on the Chautauqua system. It is intended to build up a summer settlement about the school which will in the near future aggregate a population of 5,000, and a system of sewerage, water-supply, and lighting has been planned. Inducements are being made to Catholics to build their own dwellings,

but many cottages have already been erected by the trustees. Many improvements were made in 1901. The primary import of the summer school is to give the Catholic point of view on issues of the day in history, literature, philosophy, political science, economics, science, religion, etc., and to afford means for social intercourse and recreation. The session of 1901 included over 80 lectures by eminent Catholic and other writers and thinkers. Several courses of special study were offered and a number of educational conferences took place. A new musical society was organized in Plattsburg, under the Champlain Choral Union. President of the school, Rev. Michael J. Lavelle, LL.D., New York; secretary, Warren A. Mosher, Youngstown, O.; official organ, *Mosher's Magazine*.

CATHOLIC UNIVERSITY OF AMERICA, Washington, D. C., is an institution of wholly a university character, since it gives instruction only to young men who have completed collegiate courses at affiliated colleges or elsewhere. The registration during the year 1901 was 165, a slight decrease from the preceding year. During 1901 one new institution, St. Austin's, was affiliated. This college was established in the neighborhood of the university in the summer of 1901 by the Sulpician fathers. During the year an increase of more than \$40,000 was made to the endowment. The library contains about 35,000 volumes, this being an increase of 3,000 over the preceding year.

CATTELL, JAMES McKEEN, professor of psychology in Columbia University, was elected to the National Academy of Sciences at the spring meeting of 1901. He was born at Easton, Pa., May 25, 1860, and was educated at Lafayette College, receiving the degrees of A.B. (1880) and A.M. (1883). After studying at Johns Hopkins University and various European laboratories he took the degree of Ph.D. at Leipzig in 1886. He was lecturer at the University of Cambridge in 1886, and in 1888 was appointed professor of psychology at the University of Pennsylvania. In 1891 he went to Columbia as professor of experimental psychology, being placed in charge of all work in psychology in 1896. Professor Cattell has played an important part in instruction in psychology in the United States. Besides being the first professor of psychology at an American university, the laboratory he established at the University of Pennsylvania was the first in which undergraduate instruction was given, and his present laboratory at Columbia University is probably the largest and best equipped in the world, occupying, as it does, some 19 rooms. He is the president of the American Society of Naturalists and chairman of the advisory board of the New York State Pathological Institute. He is active in the American Association for the Advancement of Science, having been for some years a member of its council. He served as vice-president of the New York Academy of Sciences and is the editor of *Science*, *The Popular Science Monthly*, the *Science Series*, and the *Psychological Review*. Professor Cattell's scientific researches and publications have been chiefly in the direction of applying experimental and exact methods to the study of mental processes, the measurement of mental time and intensity, the perception of space, experiments on memory and the association of ideas, mental statistics and similar subjects.

CAVITE FEVER. An endemic fever principally confined to the vicinity of the peninsula of Cavite, though sporadically invading other parts of the Philippines, and so named by Surgeon George Pickering, United States Navy. At least 70 per cent. of the marines quartered at the naval station at Cavite have suffered from one or more attacks of the disease, newcomers contracting it within two or three weeks after arrival. It is an acute infectious disease, with abrupt onset, characterized by high temperature, severe muscular pain, and very painful and tender eyeballs. The cause of Cavite fever is supposed to be a specific micro-organism, not yet isolated. The period of incubation is apparently from two days to two weeks. After a slight chill, the patient suffers from a temperature of 104° or 105°, or even 107°. The face is flushed; the ocular conjunctiva is injected and very painful; the skin is hot; the pulse full, strong, and accelerated; delirium is not infrequent, and the patient shows signs of extreme prostration. Usually nausea and vomiting, constipation, scanty urine, headache, as well as severe muscular pain, are present. After three, four, or five days the temperature falls, and generally the muscular pain decreases with the decline of fever. Cavite fever may be confounded with dengue but is distinguished from it by the absence of an afebrile period and of a rash. There are no catarrhal symptoms. Cold sponge baths, or "tubbing," as in typhoid, are recommended for reduction of temperature, together with an ice cap to the head for local relief. Rest in bed, calomel, acetanilid, and quinine are used during the attack, and tonics containing strychnine, iron, and quinine for ten days after the subsidence of the fever and the disappearance of pain. Peripheral neuritis has followed some severe attacks of the disease, with foot-drop and muscular atrophy.

CAZIN, JEAN CHARLES, French painter, died in Paris, March 27, 1901. He was born at Samer, Pas-de-Calais, about 1840, and received his instruction in designing from Lecoq de Boisbaudran. He exhibited at the Salon first in 1876, and received the medal of the first class there in 1882, and also participated in many other exhibitions, notably that of *l'Union des Arts Decoratifs* of 1882. His best-known paintings are "The Flight Into Egypt" (1877); "Tobit" (1880); "Ishmael" (1880), now in the Luxembourg Gallery, and "Judith" (1883). While he included figures in his work, they appear only as parts of his landscape, never superior to it, and in his moonlight effects he endowed twilight with a melancholy tenderness that is unexcelled. He became a member of the Legion of Honor in 1882 and was promoted to officer in 1889.

CELEBES, one of the Dutch East Indian islands, lying east of Borneo and south of the Philippine Islands, has an area of about 72,000 square miles and a population estimated at 2,000,000. The island is in charge of a governor, acting under the authority of the governor-general of the Dutch East Indies. The principal towns are Menado, Port Rotterdam, and Vlaardingen (Macassar). The divisions of the island are for the most part native states recognizing Dutch authority. The products are similar to those of the other East Indian islands. See **DUTCH EAST INDIES**.

CENSUS. For the results of the censuses taken in foreign countries in 1900 and 1901, see **AUSTRALIA**, **AUSTRIA-HUNGARY**, **BELGIUM**, **CANADA**, **FRANCE**, **GERMANY**, **GREAT BRITAIN**, **INDIA**, **ITALY**. The results as to population of the census taken in the United States in 1900 were made known near the close of that year. The census returns in the United States, however, included many other tabulations beside that of population. These tabulations were conducted with much greater rapidity than ever before, and a large number of them were made public by the end of the year 1901. For the total population of the United States as composed of native whites, foreign whites, native whites born of foreign parents, and negroes, see **POPULATION**. For the geographical distribution throughout the country of the negro population and its relative degree of literacy, see **NEGRO PROBLEM**. For the relative degree of literacy of the various elements of the population of the United States, see **EDUCATION**. For the total population of each State and of the largest cities in the State as ascertained by the census in 1900 and as computed by the government actuary in 1901, see the articles on the several States. The statistics of agriculture of each State for 1900, as ascertained by the census, were not available except in a few instances by the end of the year 1901, and they have therefore not been included. On the other hand, the exhaustive researches made by the census as to the manufactures and industries of each State and their growth during the decade were in most cases available, and abstracts of them have been included in the articles on the several States. The Census Bureau has not been content to make these articles merely statistical, but has in nearly every case shown the peculiar economic advantages or disadvantages of each State in regard to specified industries, and has thus added greatly to the value of the statistics.

CENTRAL AMERICA, with an estimated area of upwards of 170,000 square miles and an estimated population of about 3,500,000, includes the five republics of Guatemala, Honduras, Salvador, Nicaragua, and Costa Rica, and the colony of British Honduras. These states are treated under their own titles. A series of treaties were concluded in February, 1901, among the Central American republics, authorizing arbitration for the settlement of future disputes. In the fall of 1901 it was rumored that President Zelaya, of Nicaragua, was attempting to bring about the federation of the several republics. In view of the failure of the well-developed movement toward the same end in 1897-98, such an attempt now seems to have little promise of success.

One of the most important subjects concerning Central America as a whole continues to be the development of German interests. Although these interests have suffered during the last few years, largely on account of the unfavorable coffee market in Europe and the United States, it does not seem likely that they will fail to advance. The Germans in Central America are "foremost in every profession, trade, and occupation," and they control not only all of the commerce with Germany, but most of it with Great Britain and California. The total trade with Germany has amounted annually to from \$7,000,000 to nearly \$12,000,000. German farms and plantations in Central America comprise more than 742,000 acres, on which some 20,000,000 coffee trees are planted. In Guatemala, where German interests are strongest, almost one-half of the entire coffee and sugar crops are under German control. Early in 1901 it was announced that Germany had established a consulate-general at Managua, Nicaragua, the appointed incumbent being the first German salaried consul in Central America. He has consular jurisdiction throughout the five republics. Though German investments in Nicaragua amount in value to less than

one-fourth of those in Guatemala, the former state was preferred for the new consulate on account of the importance of that region in view of the probable construction of the Nicaragua Canal. For trade with the United States, see UNITED STATES (paragraph Commerce).

CEYLON, an island in the Indian Ocean off the southern extremity of Hindustan, constituting a British colony, has an area of 25,365 square miles, and an estimated population (1901) of 3,576,990, a gain over the census of 1891 (3,009,461) of more than 18 per cent. Population by races: Singhalese, 2,334,570; Tamils, 950,844; Moormen and some other races, 249,572; Eurasians, 23,253, and Europeans, 9,583; besides some Veddahs, possibly the aborigines of Ceylon, Afghans, and Malays. Considerably over half of the population is Buddhist. The capital is Colombo, a port on the west coast. In 1899 there were 47,482 pupils in government schools, 111,145 in subsidized schools, and 34,841 in unaided schools, a total of 193,468 receiving regular instruction, or about 1 in 16 of the population. The royal college, a government high English school, and other subsidized English schools, exist, and there are a number of schools for technical or industrial instruction.

Government and Finance.—Since 1815 Ceylon has been under British rule. It is administered by a governor, aided by an executive council; and the members of this council, with several other officials, constitute a legislative council. The colony is divided into nine administrative provinces, over each of which a government agent presides. There is also a system of municipal and local administration. The military and naval forces are a part of the regular establishment of Great Britain. Ceylon has no navy, coast defenses being supplied partly at colonial, partly at British, expense. The regular British troops of all arms number 1,771, and there is a volunteer force numbering 1,838. The local monetary unit is the rupee, worth 32.4 cents. The colonial revenue for 1900 was 27,325,930 rupees, against 25,913,142 rupees in 1899; the expenditure, 28,948,925 rupees, against 24,950,940 rupees in 1899. The public debt in 1900 was £3,419,451, and the local silver debt, 3,239,585 rupees, both incurred entirely for public works, including railways. The revenue is derived chiefly from customs (yielding in 1899, 6,752,367 rupees), the government salt monopoly, port dues, stamps, and licenses on spirituous liquors. The principal items of expenditure are for establishments (5,931,333 rupees in 1899), public works, the army, and interest on the debt.

Industries and Commerce.—Including the grazing lands, about one-fifth of the area of the island is under cultivation. In 1900 the areas of the leading crops were as follows: Rice, 672,584 acres; other cereals, 109,095 acres; tea, 405,405 acres; coffee, 7,086 acres; cocoanuts, 846,115 acres; cinchona, 437 acres, and cinnamon, 39,619 acres. The live stock in 1899 included 1,357,800 cattle, 84,215 sheep, 89,474 swine, and 156,874 goats. The native industries include manufactures of gold, silver, ivory, and tortoise shells, pottery, oil refining, sugar, mats, fans, and wood carving. Gems are mined to an extent that has made the island famous in this regard, 491 quarries being worked in 1899. In the Gulf of Manaar extensive pearl fisheries are operated. The total imports of the colony for 1900 were 122,339,578 rupees, an increase of 10,347,409 rupees over 1899; the exports, 94,962,277 rupees, a decrease of 6,614,630 rupees. Nearly one-half the imports are from India, and nearly one-fourth from Great Britain. The largest export is tea, amounting in 1899 to 129,661,908 pounds. Coconut oil, cinnamon, and coffee are also largely exported. The yield of graphite, the purest quality of which is found in Ceylon, has fallen off about one-half in the last few years, and the market is being taken by Bavaria, where refining processes have produced a quality nearly equal to that of Ceylon. The annual production in late years is about 12,000 pounds, mostly exported.

In 1900 there were 298 miles of railroad open to travel. The post and telegraph offices number 367. There are 2,451 miles of telegraph wire.

History.—In April, 1901, Ceylon received the Duke and Duchess of York, who were welcomed by the governor and legislative council. The whole number of Boer prisoners received up to October 18 was 5,125. Many of these have offered to enlist in the British army for service outside South Africa, and have taken the oath of allegiance to Great Britain. The reports of their treatment in Ceylon have been wholly satisfactory. At the opening of the legislature in October, 1901, the governor, Sir J. West Ridgeway, announced that considerable progress had been made in railway extension, irrigation, and other public works, and that the finances, trade, and industries were in good condition. A commission was appointed to consider the subject of taxation. At Colombo extensive harbor improvements have been undertaken.

CHANNING, WILLIAM ELLERY, American author, died at Concord, N. H., December 23, 1901. He was born in Boston, November 29, 1818, and was educated at the Boston Latin School and Harvard College. Removing first to Illinois in 1839, he later went to Cincinnati, where he was connected with the *Gazette*, and returned

to Massachusetts in 1842. Afterward he was engaged with the *New York Tribune*, the *New Bedford Mercury*, and the *Boston Journal*, and he was one of the contributors to the *Dial*. Among his publications are a number of volumes of verse and many prose essays. He was a close friend of Thoreau and Emerson, living in entire sympathy with the so-called "Concord School." He wrote: *Near Home* (1858); *The Wanderer: A Colloquial Poem* (1871); *Thoreau, the Poet-Naturalist: With Memorial Verses* (1873); *Eliot: A Poem* (1885); and *John Brown and the Heroes of Harper's Ferry: A Poem* (1886). He was a nephew of the great preacher, William Ellery Channing.

CHARLESTON EXPOSITION. See SOUTH CAROLINA EXPOSITION.

CHARITY ORGANIZATION. Charity work continues to progress along lines of cooperation, centralization, and methodization. The consolidation of three magazines has given subscribers in a compact form a periodical meeting the needs of those interested in charity work. In 1897 *Lend a Hand* was combined with *The Charities Review*. Beginning with January, 1901, *The Charities Review* appeared as the monthly issue of *Charities*, published by the Charity Organization Society of New York. *Charities* continues to be a weekly review of local and general philanthropy, "dealing with current news relating to charities, social reform, preventive work of all kinds, legislation concerning charitable interests, and other matters of interest to members of philanthropic and reform bodies, and to public-spirited citizens." In addition to the usual interest in the dependent, the defective, and the delinquent, charity workers are broadening the basis of their work by paying special attention to the standard of living. Specific subjects that also created interest during 1901 are consumption, juvenile courts, and the training of charity workers.

Standard of Living.—Sidney Webb recently said that twentieth century politics, so far as concerns home affairs, will be dominated by the idea of the compulsory maintenance of the standard of life. Charity workers are recognizing this necessity in their individual and preventive efforts, and at their summer school devoted a day to the discussion of the standard of living and the way in which it may be raised or lowered by the remedies offered. Mr. Homer Folks, in an address at the annual meeting of the Boston Associated Charities, expresses this feeling: "I think the city should cooperate with the labor unions in maintaining and establishing the eight-hour law and the prevailing rate of wages. . . . I conceive that it is the city's duty . . . to help to establish a standard of living as good as possible. . . . Charity organizations are from day to day, perhaps more or less consciously, fixing the standard of living for hundreds of families, and in that light these families and their neighbors, friends, and relatives must read our idea of what the standard of living should be. . . . We should not acquiesce, much less impose, upon our beneficiaries, an unwholesome standard of living, but we should on all occasions so exert our influence and so direct our practice as to raise their standard of living, at least to what we consider the minimum consistent with health, property, and good citizenship. . . . Restoration to self-support is not necessarily a satisfactory result, for there may be and there often is self-support at a standard of living which is inconsistent with well-being. . . . There are all sorts of people who are on a basis of economic independence, but the condition and nature of whose occupation is such as to impair the vitality, undermine the morals, and blast the future of themselves or others." Mr. Seth Low, in a speech to labor organizations during the campaign in New York City, explicitly promised support to the doctrine that it was part of the business of a municipality to aid in securing a certain standard of life, wages, and comforts. He pledged himself to secure eight hours for city work, contract or not, to use city resources to rehouse, if necessary, and in all respects to make the city an employer whose first care should be that a certain standard of life was maintained. In commenting on this point of view, *Charities* remarks that "it transforms the conception of the standard of living from a merely individual or family ideal into one that is purely social. It implies an obligation on the part of the community toward its social dependents."

Tenement-House Reform.—The practical form which this interest in the standard of living has taken is the investigation of the tenement-house problem. A number of prominent charity organizations, notably those of New York, Cincinnati, Kansas City, Indianapolis, Boston, and Chicago, are giving special attention to the housing problem. The Charity Organization Society of New York is trying to have the new tenement law properly enforced; the Cincinnati, Kansas City, and Chicago organizations are making extensive investigation. Mr. Devine, in reporting for the committee on "Improved Housing" at the second New York State conference, says that there are three ways to eliminate this evil: (1) Restrictive legislation; (2) sanitary inspection; (3) educational propaganda. The educational propaganda is being carried on by means of lectures illustrated by stereopticon views of various tenements and their surroundings. The tenement-house exhibit prepared by the

Charity Organization Society of New York for the Paris Exposition was on exhibit at the Pan-American Exposition at Buffalo, and it is desired to send it to other cities. It consists of models of a block of existing tenement-houses in the city of New York as it stood on January 1, 1900, a block of typical tenement-houses built in accordance with the laws in force January 1, 1901, and a block of model tenements; photographs illustrating tenement-house conditions in other American cities, and photographs of model houses in various parts of the United States. It was through the efforts of the tenement-house committee of the Charity Organization that the State appointed the Tenement-House Commission of 1900, the result of whose work is embodied in the new tenement-house act. In Kansas City a company has been formed to build small cottages on a tract of land three miles outside the city. Of interest in this connection is the decision of the London County Council to buy 225 acres on which to build workmen's houses to accommodate 42,500 persons at a cost of £1,500,000.

Consumption.—Philanthropic workers are becoming interested in tuberculosis from two standpoints: (1) The growing recognition of its contagious character and its relation to the whole community; (2) the misery which it brings to hapless workers who are dependent upon their work or have others dependent upon them. Many working people become homeless and subjects for charity as the disease progresses. Others are obliged to remain at work during the incipient stages, when a cure is possible. In both cases the afflicted person is a centre of contagion in lodging houses, homes, and workshops. The danger from tuberculosis is an important item in the tenement-house problem, since cleanliness, light, and ventilation are necessary to stop its ravages, and the mortality increases with the density of population. The remedies are, therefore, the improvement of the conditions under which people live and work, and the establishment of institutions for incipient cases. Sanatoriums for adults and seaside homes for children afflicted with scrofula are advocated. France has two public sanatoriums and a dozen private ones. The New York State legislature has recently provided for one in the Adirondacks. Other States are considering similar appropriations. Pennsylvania permits residence on the forest reserves, and furnishes tents and fuel. Private philanthropy has endowed a number of institutions—Stony Wold, in New York; Free Hospital for Poor Consumptives, in Philadelphia; National Jewish Hospital, of Denver; Indigent Consumptive Aid Association of America; the Rocky Mountain Industrial Sanatorium, of Colorado, for people of small means, and the free hospital near Toronto, founded by the National Sanatorium Association of Canada. The problem for charity workers is to provide for the proper care of incipient cases and make it possible for them to stop work and be removed to a place where they will not spread the disease.

Juvenile Courts.—The successful working of the Chicago Juvenile Court has created a general interest in the treatment of youthful offenders throughout the country. An amendment of the Illinois law went into effect July 1, 1901, and provided that any child under 10 years old found begging or selling articles or singing or playing musical instruments on the streets might be presented to the Juvenile Court as a dependent. As a result the Visitation and Aid Society are trying to stop begging. The Illinois law has taken a strong hold of the societies and institutions caring for children in Chicago and has furthered cooperation between them. The chief probation officer's salary is provided for; the other officers are paid by private charities, the Visitation and Aid Society supplying three. The officers report that the homes of the children are improved as the result of the supervision. During the three years prior to the passage of the law, Cook County Jail held 1,705 boys under 16 years. In the past two years hardly a dozen have been imprisoned. For Wisconsin, Pennsylvania, the District of Columbia, and St. Louis, Mo., laws have been enacted similar to the Illinois law. The law went into force in Milwaukee, July 1, 1901. Kansas City, without State legislation, has arranged for special rooms in the county jail, and probation officers are provided from private sources. The new court has already been organized in Philadelphia. Section 1,399 of the revised charter of New York establishes a children's court. Through the efforts of the Charity Organization Society the amended charter of Buffalo provides for 5 probation officers and a separate court.

Training for Charity Workers.—Mr. Frank Tucker, general agent of the New York Association for Improving the Condition of the Poor, in an article on *What a Charity Worker is Expected to Do*, says: "We expect the charity worker to see facts, to record facts, to use facts, to learn resources, to develop resources, to use resources, to classify results, to produce results, to record results, to deduce principles, and to formulate principles." To summarize in another way, the charity worker must gather relevant and essential facts and have incidents in mind to illustrate important discussions; executive ability to meet the present conditions and provide a remedy; knowledge of public and private charitable institutions, of the personality of gov-

erning boards, and of charitably inclined individuals; and the history and development of charity work, the methods that have been tried and failed, and those now in force. Professionalism in charity work began when "a standard of qualifications was set up governing paid workers." There is now a growing recognition of the need of placing the care and treatment of dependent members of the community in the hands of people who have natural qualifications for the work and who have been educated and trained to follow it as a profession. There is an increasing demand for such workers in charity organization societies and kindred agencies, as well as in some public positions. The announced appointments of Mr. Seth Low, elected mayor of New York in November, 1901, show the character of some of the leaders in charity work. Mayor Low himself was a vice-president of the Charity Organization Society, and a valued coadjutor. His appointments include the president of the Charity Organization Society as tenement-house commissioner; an assistant secretary as deputy tenement-house commissioner; an active worker on three important committees as commissioner of public charities; five other members of the tenement-house committee to minor positions, and the head of the University Settlement as private secretary to the mayor. Mr. Jeffrey R. Brackett, in a paper read at the National Conference of Charities and Corrections outlines the present opportunities for training in charitable work. He distinguishes first between training and instruction. There has been an increase in a number of the courses offered on public aid, charity, and correction in universities, colleges, and theological schools. For professional training, however, in experience, there is yet no school. Boston and Baltimore associated charities have given the applicants for positions as district agents a certain period of instruction under the general secretary. Philadelphia plans to do the same thing. The St. Louis Provident Association has undertaken to train some visitors and employees of the association. For three years the general secretary of the Boston Associated Charities has had a study class in which members not only read, but study books and papers and compare experiences. The Summer School in Philanthropic Work, conducted by the Charity Organization of New York, and begun in 1898, offers a valuable course, especially designed for professional charity workers. The requirements for admission are a college degree or a year of actual service in philanthropic work. The course lasts six weeks and consists of lectures and discussions, special inquiries, visits to institutions and agencies, and training with experienced workers in charity and correction. The speakers are leaders in their lines of work. In 1901 the programme of the course, from June 17 to July 27, was arranged as follows: Three weeks to the treatment of needy families in their homes; one week to the care of dependent, neglected, and delinquent children, and the remainder of the time to medical charities, the institutional care of adults, neighborhood improvements, and the scope and methods of charity organization. Another movement, with a social feature, is the formation of city clubs of charity workers. Boston has had a Monday Evening Club for several years. In December, 1901, New York formed a Monday Club, to which any person receiving compensation for charity or philanthropic work is eligible. On November 4, 1901, Baltimore formed the Eight O'clock Club, to meet on the first and third Mondays of each month. Cincinnati has a club, organized three years ago, modeled after the Boston club. These clubs have simple constitutions, and small fees (usually a dollar). Papers or informal discourses, followed by some form of entertainment and simple refreshments, make up the programme. The aim is to discuss problems from a local standpoint and to increase the acquaintance and thus the cooperation of charity workers. The files of *Charities*, reports of societies, and national and local conferences are providing students with a valuable literature.

Work of Charity Organizations.—Baltimore. During 1901 twenty new charity organization societies were formed. The principal work of the Charity Organization Society of Baltimore has been the revision of the Charities Directory for the second time, which has been undertaken by volunteer workers. The society reports an advance in constructive work, a growing appreciation by police and press of relief administered without publicity; an increased cooperation between the society and private agencies; the complete substitution of The Friendly Inn for the free lodgings at police stations and the almshouse, and the placing of the city almshouse under trained charity workers. The society has increased the city districts from six to eight, and has two neighborhood houses, with the promise of others.

Boston. The reports of the district conferences are the unique contribution of the report. They contain such interesting data as the following: "An analysis of 153 cases out of 180 new ones, showing the effect of an increased demand for labor and an unusually mild winter, which resulted in a larger proportion of applicants where condition was due to moral shortcomings"; and particulars regarding cases that have been under the care of one visitor for several years. This conference reports 65 families that have become self-supporting in the last ten or twelve years.

Many questions are raised by these conferences. The Boston Associated Charities work is characterized by the stress laid on friendly visiting.

Buffalo. The "church district plan" gives a special interest to the work of the Buffalo society. It is reported as "still experimental." At the instance of the Charity Organization Society, 101 churches of all denominations, including Roman Catholics, Jews, Unitarians, and the Salvation Army, and also the nine settlements of Buffalo, have accepted small districts from the Charity Organization Society, within which they are responsible for the care of the neglected poor of any faith. The object is to cultivate friendliness, in addition to almsgiving. At the church conferences the Charity Organization Society urges uplifting social work, such as libraries, penny provident funds, kindergartens, and classes.

Cambridge. This report is devoted chiefly to a discussion of cases of desertions. Seventy-one families were investigated in order to discover the cause of desertion, with the following result: Intemperance in 23 cases; licentiousness in 12; lack of thrift, incompatibility, unwise philanthropy, gambling, and roving disposition in other cases, while bad cooking and wretched housekeeping have much to do with it.

Chicago. The activities of the Bureau of Charities have included vegetable gardens, summer outings, and home libraries. Its secretary states that: "In accordance with its fixed policy of entering actively into public efforts intended to improve living conditions among the poor, the bureau, by accredited representatives, participated during 1901 in numerous movements of a philanthropic character.

Cleveland. The first annual report of the Associated Charities, which succeeds the Bethel Associated Charities, lays emphasis on friendly visiting and district organization. The city has been divided into twelve districts on ward lines. Each district has a physician and 7 to 24 visitors. This report contains a list of the charity organizations of the city.

Minneapolis. The Associated Charities report announces four definite plans for the future: (1) To establish two district conferences; (2) to start an educational canvass as propaganda for organized charity; (3) to publish a charities directory; (4) to extend the work of the penny provident fund.

New York. The notable achievement of the Charity Organization Society of the City of New York is the passage of the Tenement-House Act. The tenement-house committee has been reorganized to see that the law is enforced and to encourage private investment in improved tenements. The central office of the society serves as a bureau of information for (1) destitute persons; (2) persons wishing information and advice regarding people in distress; (3) persons who are desirous of starting charity organizations or institutions. By means of correspondence, *Charities*, its reference library, its summer school, its *Charity Directory*, monthly conferences conducted during the winter, local district conferences, and lectures arranged for by the districts, the society exerts a constantly increasing influence upon the charitable work of New York City and the country at large. The reference library deserves special mention. It contains 2,100 volumes, 1,200 pamphlets, and 80 periodicals, and an extensive system of newspaper clippings.

Philadelphia. The Philadelphia Society for Organized Charity announces a gift of \$50,000 for a Wayfarers' Lodge and Woodyard. The new building, which will be fireproof and will contain facilities for bathing, ventilation, and disinfecting, precautions against fire, a large assembly and reading room, a smoking room in the basement, 16 beds for women, and 208 beds for men, will be ready in May, 1902. In 1901 30,690 lodgings were given at the two woodyards, and 61,274 meals, at a cost, after deducting the labor, of \$4,081.62. The society distributed 10,000 pamphlets entitled *Concerning Tramps and Beggars*. A system of training all paid workers for six months by the general secretary is planned.

St. Louis. St. Louis has no charity organization, but the different societies cooperate to some extent, and the St. Louis Provident Association endeavors to perform the functions of a central organization by carrying on similar activities and promoting cooperation. Conferences of workers and monthly meetings have been organized.

San Francisco. The medical needs of San Francisco are provided for by visiting nurses and the cooperation of doctors. San Francisco has just published a revision of the *Charities Directory* of 1894. This has been done by municipal authority, the city paying for the printing, while the Associated Charities has provided the office room, the Merchants' Association the typewriting, and Dr. Mary Roberts Smith, of Stanford University, has edited the work.

Hawaii. The Hawaii Charity Organization Society was established March 27, 1899. It has now eighteen affiliated societies. There is comparatively little destitution in the island.

Cuba. Beneficial institutions and hospitals have been reorganized, sometimes renovated and reequipped, industrial and manual training institutions established, and a new law providing for the care of children put in operation. Within the past few months 50 to 60 smaller asylums have been broken up, as the children have

been taken by relatives and friends who are now able to care for them. The Cuban Orphan Society has cared for 777 children since its establishment, November 24, 1900.

Porto Rico. The report of the governor for the year ending May 1, 1901, states that the board of charities created by military rule April 30, 1900, was in existence ten months when it was superseded by an act of the legislative assembly by which a director of charities was appointed by the governor. Under the old board the sanitary conditions of the schools for orphan children were reconstructed, manual training introduced, the insane asylums improved and enlarged, lepers placed in a colony on the Isla de Cabros at the entrance of the harbor of San Juan. The hospitals and asylums are still under municipal control. The governor suggests that they would be better managed by the insular government.

National Conference of Charities and Correction.—The twenty-eighth national conference convened at Washington, May 9-15, 1901, with an attendance of 600 registered delegates. Four sessions of the conference were devoted to a discussion of the care of needy families in their homes, under the chairmanship of Miss Zilpha D. Smith, of Boston. The report of the committee on the care of the feeble-minded and epileptics stated that the general trend of opinion is toward better and more thorough training, more permanent cure, and better classification. Miss Bancroft read a paper with a forcible argument in favor of small private training schools. The session devoted to the public policy in the care of the insane dealt with the question of the manner of commitment, difficulties having arisen with the judicial procedure. Diets were also discussed, the main thought being economy in quantity and quality and the prevention of waste. The revolution in the treatment of the criminal was outlined in the report of the committee on the treatment of crime, which emphasized the principle of the indeterminate sentence, the probation system, the value of a parole law, and the importance of obtaining trained and competent wardens and employees. A resolution was passed expressing the hope that the new prison of the United States at Atlanta will be organized on reformatory principles and its officers be appointed for fitness only. Juvenile reformatories and industrial schools and destitute and neglected children were discussed. At the latter session various plans of supervision were presented and the discussion returned to the old topic—the institution versus the family. The committee on legislation concerning charities made a plea for the establishment by the national government of a bureau of charities and correction for the collection, arrangement, and distribution of statistical and other useful information. The resolution to appoint a committee to secure this legislation did not meet with favor as worded, and a committee was finally appointed to confer with the director of the census in regard to the collection of statistics. The new committee on division of work between private and public charities discussed the question of granting public subsidies to private charities. The committee reported that the practice was widely prevalent, but advocated the complete separation of public and private funds.

State Conferences.—Nineteen State conferences of charities and correction now exist: California, Colorado, Delaware, Illinois, Indiana, Iowa, Kansas, Nebraska, Michigan, Minnesota, Wisconsin, Maryland, New Hampshire, New York, Ohio, Ontario, Oregon, Pennsylvania, and Missouri. None of these conferences is more than ten years old. The California, Kansas, Missouri, New York, and Oregon conferences were added during 1901. These conferences confine their efforts to educational work, although some—Pennsylvania and New Hampshire, for instance—work directly for legislation. They offer an open forum for free discussion. The papers are given by prominent men from without the State, heads of institutions, leading charity workers, college professors, and public officials. A feature of several conferences during 1901 was talks illustrated by stereopticon views. The California conference passed a resolution asking for a probation law. The Ohio conference, which is the largest, showed great interest in the juvenile court. The Minnesota conference held meetings at the State public school and school for blind; an illustrated lecture was given on the child-saving movement, and emphasis was given to the need of amusements for the insane and feeble-minded. The Indiana conference was well organized, with a summary of the work of the board of State charities, an outline of the work of different institutions, and papers on timely subjects. The feature of the Missouri conference was a paper by Hon. James L. Blair, of St. Louis, on *Politics in State Institutions*, in which he criticised the action of the governors of Illinois and Missouri for their partisan appointments of secretaries to the State boards of charities and correction. The Michigan conference, by exhibits of the work of the blind, deaf, and reformatory inmates, endeavored to show what is being done. The New York conference, previous to the November meeting, sent out a circular giving a list of reference books for preparation. A notable programme was prepared and large audiences heard the addresses. At a number of conferences arrangements were made for college and high-school students, as well as the general public, to attend the meetings.

CHATIN, ADOLPHE, French botanist, died January 13, 1901. He was born at Ile-Marianné-de-Saint-Quentin in 1813, and after devoting himself to the study and practice of pharmacy, studied at the University of Paris, where he received the bachelor's degree, and subsequently the degree of Doctor of Science. He graduated in medicine in 1844, and was appointed (1848) professor of botany in the School of Pharmacy, of which he became director in 1873. He retired from this position in 1886, and was made honorary director. In 1874 Dr. Chatin was elected a member of the Academy, and became its president in 1897. He was the author of *Anatomie Comparée*, an exquisitely illustrated work, two volumes of which were published (1856-1862), but which was never completed. In addition to his many studies in plant anatomy, he was the author of *De l'Anthère* (1870) and numerous other works dealing with botanical and chemical subjects. He also published papers on the diseases of potatoes and vines, the cultivation of truffles and other edible fungi, and a book on watercress.

CHAUTAUQUA SYSTEM OF EDUCATION, originated in 1874, has two main divisions of its work: (1) the Chautauqua Scientific and Literary Circle (C. L. S. C.), for the carrying on of home reading during nine months of the year; and (2) the annual assembly at Lake Chautauqua, N. Y.—summer schools six weeks, lectures and entertainments eight weeks, in July and August. The continuous summer school was the first of its kind, and the model on which more than 120 summer assemblies, held in 35 States, have been formed, with an approximate attendance of 1,000,000 persons. In the four-years course of the C. L. S. C., over 260,000 readers have been enrolled since its organization, and over 41,000 have been graduated. These circles now exist in many places outside of the United States. At the conclusion of the four-years' course of reading, special courses of study are outlined for those who wish to continue. There are three grades above that attained by the C. L. S. C. graduate, represented by the Order of the White Seal, which in 1901 had 11,801 members; the League of the Round Table, with 2,569 members; and the Guild of the Seven Seals, with 630 members. The general subjects of the regular four-years' course for 1901-02 (the Italian-German year) are German and mediæval history; United States diplomacy; Roman and Italian life and literature; first steps in human progress. The official organ is the *Chautauquan*, published monthly. The twenty-eighth annual assembly had an attendance of about 50,000 persons in all, the population at any one time being from 12,000 to 15,000. A successful feature of the year 1901 was a new library school. The Hall of the Christ, containing an auditorium, library, and art gallery, all devoted to the study of the Saviour's life, was in course of erection during the summer. A building for the girls' club was planned and an addition to the boys' club was under construction. Important transportation improvements are promised in the near future, including a new railway route to Westfield, a new pier at Point Chautauqua, and a new lake steamer. The *Chautauqua Assembly Herald* was published daily (40 numbers) during the assembly, completing its twenty-sixth volume. The first volume of the *Chautauqua Quarterly*, a 20-page pamphlet, was published during 1901. Chancellor of the Chautauqua system, John H. Vincent; secretary, Ira M. Miller; general offices, Cleveland, O.

CHEMISTRY. In reviewing the progress of chemistry in 1901, there is distinct evidence that the results of the laboratory, when properly interpreted, show a growing tendency to provide the students of this science with more accurate and more comprehensive generalizations. It is also to be observed that the conditions of civilization are more and more demanding the services of chemistry. At a conference in London in December, the neglect of science teaching was deeply lamented, and it was declared that if such teaching had been taken up thirty years ago English industries would have saved millions of pounds. The preëminence of Germany in that respect was referred to as follows. In German factories 10,000 chemists are working, producing ideas that tend to increase the productive power of their country. Germany's success in sugar production is due to the scientific attainments of her workers. Germans prepare the ground slag of a certain steel process as a fertilizer, which is being imported by England. Germans are wonderfully successful in the dyeing industry, and German chemists have discovered a practical process for producing artificial indigo which is injuring the Indian indigo trade. One of the lessons of the Pan-American Exposition was the wonderful utilization of the energy of the Niagara River, and particularly its application to the manufacture of chemical products. It is said that the total capital invested in electro-chemical manufactories all over the world is about \$150,000,000 and the horse power about 400,000. About 65 per cent. of such plants are in the United States, 10 per cent. in Germany, 10 per cent. in France, 2 per cent. in Switzerland, and 1½ per cent. in England. Of more than passing significance was the offer made by the Prussian government of a full professorship of inorganic chemistry in the

University of Göttingen to Dr. Theodore W. Richards, of Harvard University. The offer was accompanied by the assurance that Dr. Richards's duties should consist exclusively of original research and the direction of students of research. The offer was not accepted. The growing recognition of American chemists is perhaps further made apparent by the elevation in 1900 of Frank P. Venable from the professorship of chemistry in the University of North Carolina to the presidency of that institution, and in 1901 by the similar selection of Ira Remsen (*q.v.*) for the presidency of the Johns Hopkins University after a quarter of a century's successful occupancy of the chair of chemistry.

Organizations.—The American Chemical Society, which has now a membership of 1,933 persons distributed among thirteen local sections, held two meetings during the year, the first in Denver, Col., contemporaneously with the American Association for the Advancement of Science, under the presidency of Frank W. Clarke, during August 26-31, when 24 papers were presented; the winter meeting was held in Philadelphia, Pa., during December 30-31, when the titles of 36 papers were presented, of which 30 were read, and President Clarke delivered a retiring address on "The Development of Chemistry," in which he gave a rapid review of the history of that science, and indicated the lines along which progress might be expected in the future. He especially emphasized the desirability of coöperation in chemical research rather than the present method of everyone working in his own specialty independent of others. The chemical section of the American Association was presided over by John H. Long, of Chicago, Ill., who delivered an address on "Some Points in the Early History and Present Condition of the Teaching of Chemistry in the Medical Schools of the United States," in which he urged that the chemistry bearing on the problems of life is worthy of more enthusiastic cultivation in American schools. The New York section of the Society of Chemical Industry held 8 monthly meetings (from October until June), at which 27 papers were read; there was an increase in membership of 108 persons, making a total membership of 871. During the year a canvass was made of persons engaged in electro-chemical industries with a view of organizing an American Electro-Chemical Society, and the announcement has been made that more than 200 names have been received, in consequence of which a preliminary meeting is to be called early in 1902.

Atomic Weights.—No important changes are to be noted under this heading, although much active work has been carried on. In England, Scott has devoted careful study to the atomic weight of nitrogen, but as yet his results do not warrant change in the accepted value. Similarly, Hinrichsen has redetermined the value of calcium, finding it to be 40.14, which is sufficiently near for all practical purposes to the present figures. The atomic weight of tellurium has been the subject of papers by Stiner, Pelini, and Koethner, but they are mainly controversial. Aloy has reported on the value of uranium, but his results will have to be further verified before they can be accepted. Of special promise is Baskerville's work. Besides indicating the incorrectness of the present weight of thorium, his researches seem to show the presence of a new element.

New Elements.—Difficulties in the analyses of complex compounds have frequently led to the discovery of new elements, and such is the case with the announcement of two new elements in 1901. Demarcay, who has devoted much study to the spectrum analysis of certain earths, succeeded in obtaining the sulphate of an earth in sufficient purity to identify it with the hypothetical meta-elements designated as S δ by Crookes in 1885, and as Z ζ by De Boisbaudran in 1892, and he has proposed for it the name of Europium, with the symbol Eu. He obtained it by fractional treatment of magnesium nitrate, and found its line and absorption spectra, electro-fluorescence of the sulphate in vacuo, etc., sufficiently constant and proportional to justify his announcing it before the French Academy of Sciences. Baskerville, of the University of North Carolina, who has devoted during the past five years much attention to thorium compounds, has presented a paper on a "constant unknown impurity" obtained from the mineral monazite from North Carolina, which, should it prove to be a new element, he desires to name Carolinium, with the symbol Cn. Peculiar interest is attached to this paper, as thus far the discovery of a new element has never been accredited to an American chemist.

Physical Chemistry.—The ultimate nature of matter is no nearer solution than in the past, although the work in this new branch of physics "may," said Lord Kelvin in an address before the Chemical Society, "one day be regarded as among the most important of all the new departures in science by which the nineteenth century helped us to understand the world we live in." Many trains of reasoning go to support Thomson's hypothesis that the "corpuscles," as he has called them, which appear to form the cathode, or the Becquerel rays, are almost infinitely smaller than the supposed atoms can be. It is impossible to give any intelligible idea of their size; the mind is incapable of dealing with such notions as that involved in

Bequerel's statement. For example, that in one particular experiment the efflux of material is such that one milligram would disappear from the radiating body in about a thousand million years. A study of the spectrum of a lightning flash, photographed in July, 1901, makes it appear probable, according to E. C. Pickering, that the chemical elements are so-called compounds. Some of the photographs show a doubling of the brilliant lines, and Pickering was at first inclined to believe that it was a sort of composite photograph, but he has since concluded that the doubling looks as though hydrogen, the only element studied in the lightning spectrum, and hitherto believed to be least likely ever to be proved a compound body, is made up of no less than three components. This conclusion he based on the fact that there were thirty lines in the hydrogen spectrum on one photograph, three on another, and one on the third, the different flashes having been photographed in different circumstances. Some doubt has been thrown on the axiom that the weight of substances entering into chemical combination remains the same by certain experiments by Heydweiller similar to those of Landolt, showing that a slight change of total weight accompanies some chemical reactions. It is held, however, that the axiom is not incompatible with variation of total weight in chemical or even physical changes. To obtain the point of absolute zero, which, according to Dewar, is -274° C. or -461° F. and towards the realization of which the researches of that chemist are tending, depends upon the possibility of liquefying helium; and this can only be accomplished by the same process used in the liquefaction of hydrogen, only instead of using liquid air under exhaustion, as the primary cooling agent, liquid hydrogen under exhaustion must be employed and the resulting liquid collected in vacuum vessels surrounded with liquid hydrogen.

Inorganic Chemistry.—Among the advances made during the year may be mentioned the following: A process for making hydrogen was invented by Houbon; it consists of condensing acetylene gas in a Cailletet steel bomb up to five atmospheres and then igniting by electricity. Hydrogen and carbon are set free, the latter being precipitated in the amorphous form as soot. By this method hydrogen can be produced very cheaply, and the process is said to be especially adapted for the inflation of balloons. Ramsay, who has added considerable to our knowledge of the recently discovered elements in the atmosphere, has published the following facts:

	Helium.	Neon.
Density of the gas.....	1.98	9.96
Atomic weight.....	3.96	19.92
Density of the liquid.....	0.3?	1.0?
Index of refraction (gas).....	0.124	0.235

The data for Argon, Krypton, and Xenon are more complete:

	Argon.	Krypton.	Xenon.
Density (gas).....	19.96	40.78	64.0
Atomic weight.....	39.92	81.56	128.0
Density (liquid)	1.212	2.155	3.52
Boiling point.....	-186.1° C	-151.7° C	-109.1° C
Fusion point.....	-187.9° C	-169° C	-140° C
Critical temperature.....	-117.4° C	-62.5° C	$+14.75^{\circ}$ C
Critical pressure	40.20	41.24	43.50
Index of refraction (gas).....	0.968	1.450	2.368

The following table gives the proportions (volumes):

There are 0.937 parts of Argon to 100 of air.

There are 1 or 2 parts of Neon to 100,000 of air.

There are 1 or 2 parts of Helium to 1,000,000 of air.

There is about 1 part of Krypton to 1,000,000 of air.

There is about 1 part of Xenon to 20,000,000 of air.

For comparison it may be recalled that sea water contains only about one part gold in 15,000,000 parts of water.

An electrolytic method for the separation of phosphorous was patented in Germany early in 1901. Phosphoric acid mixed with coke or charcoal is said to be used and the process is a continuous one, requiring no other manipulation than the introduction of new material when the first is exhausted. The remarkable announcement that boron is only a compound of silicon and oxygen was made by F. Fittica; this was not accepted, but may be cited as showing how imperfect is our knowledge of certain elements. Moissan and Lebeau announced their discovery of sulphuryl fluoride, a new colorless gas that boils at -52° C. and melts at -120° C.; they prepared the gas by passing fluorine into an apparatus containing sulphur dioxide, so disposed that the former gas as it reaches the latter is strongly heated by means of a

platinum wire placed at the inner end of the inlet-tube and rendered incandescent by an electric current. The investigation of the electrolytic tension of decomposition of the ammonium salts with a mercury cathode by Coehn and Danneberg has given results perfectly analogous to those obtained with salts of the alkali metals, and experiments carried out under varying conditions to ascertain the possibility of reducing the heavy metals from their solutions, show that the negative results previously obtained are due to the great instability of the ammonium amalgam. By preparing the amalgam electrolytically, at low temperature, it appears to be much more stable, and does not exhibit to any great extent the spongy appearance peculiar to the amalgam under ordinary conditions. These facts seem to settle the much debated question of the existence of an ammonium amalgam in the affirmative. A series of experiments concerning the properties of the rare neodymium chloride were presented by Camille Matignon before the French Academy of Sciences. This same chemist later described in conjunction with Delapine a series of experiments on thorium nitride and hydride, two imperfectly known compounds. M. Tarible described before the French Academy the researches by him that led to the formation of two well-defined crystalline bodies by the combination of boron bromide with the two phosphorous chlorides.

Organic Chemistry.—A painstaking German statistician has estimated that over ten thousand pages are needed to record the annual progress of organic chemistry. In general, work in the newer organic chemistry is in two directions, the one dealing with the ability of a single substance to behave as if it had two or more different structures, or to give derivatives belonging in two or more different classes and known as tautomerism, and the other treating of the chemistry of those elements other than carbon that enter into organic compounds. Titherley has described his experiments showing the tautomerism of the two amides, $C_6H_5C(OH)NH$ and $C_6H_5CO.NH_2$, and McPherson has recently pointed out that the oxyazo compounds seem to be either phenols or quinone-hyrazones according to circumstances. Baeyer and Villiger have announced in the *Berichte* of the German Chemical Society their discovery of diethyl peroxide, which has neither oxidizing nor reducing properties, but is converted into alcohol by reducing agents. Simon, in two papers presented before the French Academy of Sciences, describes the researches which led to his isolation of a new compound tartaric acid that is isomeric with pyrotartaric acid. Its aqueous solution yields an intense violet coloration with ferric salts that is exceedingly delicate. Erysimin is a new glucoside isolated from the seeds of the cruciferous plant *Erysimum aureum*, and is obtained as a pale yellow amorphous compound that is said to be a powerful heart poison. The discovery of a new alkaloid more poisonous than nicotine in tobacco has been announced. An excellent summary of the progress in organic chemistry under the title of *A Review of Some Recent Progress in Organic Chemistry*, is given by Dr. Arthur Lachman in the December, 1901, issue of the *Journal* of the American Chemical Society.

Industrial Chemistry.—The increasing uses of aluminum are noteworthy. That metal seems gradually to be replacing copper as a conductor of electricity, especially for telegraph and telephone wires. In 1889 the production of aluminum in the United States was about 22 tons and in other countries 71 tons, while in 1900 the United States produced about 4,000 tons and other countries about 7,500. Copper wires must be twice as heavy as aluminum in order to do the same work, and 6,000 tons of aluminum used for sheathing or roofs will replace 20,000 tons of copper. The use of aluminum has naturally led to a more careful study of its properties, and in France its rapid oxidation for the purpose of producing very great heat quickly and cheaply has been given the name of aluminothermy. E. Gautier has taken advantage of this property to produce artificial rubies and sapphires by the crystallization of alumina colored with metallic salts, and recommends that process for the purpose of obtaining economically a number of chemically pure metals, such as chromium, manganese, cobalt, titanium, and even iron, without resorting to electric or blast furnaces. A method of obtaining sodium, by submitting a bath containing a mixture of equal molecular weights of sodium and potassium chlorides to the action of the electrolytic current, has been invented by Fischer, and has been found to be successful in yielding sodium containing less than one per cent. of potassium. The manufacture of celluloid by dissolving nitrocellulose in naphthalene instead of in an alcoholic solution of camphor is reported. The use of iron and nickel oxide plates in a solution of potassium hydroxide in place of the lead-zinc plates in sulphuric acid has been announced as the distinctive chemical feature of the storage batteries invented in 1901 by Thomas A. Edison. Maximite is the name of a new explosive invented by Hudson Maxim. Its exact composition is secret, but it is said to be a picric acid compound consisting mainly of a picrate. Its products of combustion are almost entirely gaseous, and as the heat developed on detonation is considerable it possesses as the results of its high gravity a great explosive value. Fieldler has invented an explosive consisting of a fluid and a solid

which will not explode until they are mixed. The former is composed of nitrobenzol, 80 parts, and turpentine, 20 parts, while the solid consists of potassium chlorate, 70 parts and potassium permanganate, 30 parts. To form the explosive, 20 parts of the liquid are added to 80 parts of the solid.

Physiological Chemistry.—The experiments of Frederick G. Novy and Paul C. Freer, of the University of Michigan, have led them to the discovery of the remarkable antiseptic effect of certain organic hyperoxides. They find that these hyperoxides are decomposed on solution in water, and the solution thus formed, even when it contains but .005 of one per cent. of active oxygen, is fatal to all bacteria, and a solution containing .05 of one per cent. of active oxygen kills even the spores. It is claimed that this new preparation, to which the name of Benzozone is given, is an absolute intestinal disinfectant and antiseptic. Its value therefore in such diseases as cholera, dysentery, typhoid fever, and similar intestinal diseases is evident, for by its use the germs would be destroyed at once. M. Eckenberg announces his discovery that the substantial essence of milk can be reduced to a fine powder. If this powder be dissolved in a certain quantity of water it becomes again ordinary milk, with all its nutritive qualities, its tastes, and smell. It appears that it is now possible to obtain a definite reaction from blood-stains, however old, which indicate with something approximating absolute certainty the source of the blood under examination. This result, discovered independently by Dr. Uhlen-Luth, of Greifswald, and Dr. Wassermann and Dr. Schutze, of Berlin, is based on the fact that the blood-serum of animals which have been injected with the blood of an animal of a different species, when added to a dilution of blood from the latter, produces therein a well-marked precipitate.

Among the better known chemists who died during 1901 are Charles Chauncey Parsons (January 16), a manufacturing chemist in Brooklyn, N. Y., and an active member of the American Chemical Society; Stevenson Macadam (January 24), long professor of chemistry at the Edinburgh School of Medicine; Max von Pettenkofer (*q.v.*) (February 10), professor of hygiene in the University of Munich, president of the Bavarian Cholera Commission in 1873, and an accepted authority on hygiene and sanitary chemistry; Maurice Perkins, professor of chemistry, from 1865 till his death, at Union College, Schenectady, N. Y.; Waldron P. Shapleigh, distinguished for his work among the rarer earths, especially neodymium and praseodymium; and Sir Joseph Henry Gilbert (*q.v.*) (December 23), sometime Sibthorpean professor of rural economy in the University of Oxford, and a large contributor in the domain of agricultural chemistry, chiefly with Sir John B. Lawes.

CHENEY, PERSON COLBY, former governor of New Hampshire, died at Dover, N. H., June 19, 1901. He was born at Holderness, N. H., February 25, 1828, and received an academic education. He served in the Civil War in the Union army, and was elected to various State offices until 1875, when he became governor of New Hampshire. In 1886 he was elected to fill the unexpired term of United States Senator Pike. In 1892-93 he was United States minister to Switzerland. From 1892 until his death he was a member of the Republican national committee.

CHESS. The most important American tournament of 1901 was played at Buffalo, and was won by H. N. Pillsbury, 8 games out of 10, with Delmar second and Napier third. British and American teams of 10 contested by cable for the Newnes trophy, each side winning and losing 5 games. The intercollegiate-international cable contest between an Oxford-Cambridge six and six of Columbia-Harvard-Princeton resulted in each side winning 2, losing 2, and drawing 2 games. The United States intercollegiate championship was won by Columbia, 8½ games won and 3½ lost, with Princeton and Yale second and Harvard third. Cornell won in the triangular contest with Brown and the University of Pennsylvania. The latter won from Yale and Yale beat Brown. The international masters' tournament at Monte Carlo brought together fourteen of the world's great players. Janowski, of Paris, won 10¼ and lost 2¼; Schlechter, of Vienna, 9½-3½; Tschigorin, of St. Petersburg, 9-4; Scheve, of Berlin, 9-4; Alapin, of St. Petersburg, 8½-4½; Mieses, of Berlin, 7-6; Blackburn, of London, 6½-6½; Gunsberg, of London, 6¼-6¼; Marco, of Vienna, 6-7; Marshall, of New York, 5½-7½; Reggio, of Rome, 4¾-8¾; Mason, of London, 4½-8½; Winawer, of Warsaw, 4-9; and Didier, of Paris, ¼-12¾.

CHICAGO, UNIVERSITY OF, at Chicago, Ill., founded 1890. President, William Rainey Harper, LL.D. The university celebrated its tenth anniversary in June, 1901, by devoting a week to educational conferences, corner-stone laying, and numerous and extensive social functions. The founder, Mr. John D. Rockefeller, for the second time in its history, visited the university and participated in the celebration. The buildings for which corner stones were laid and which are in process of erection, with the estimated cost, are as follows: Heat and power plant, \$150,000; University Press building, \$100,000; Hitchcock hall, \$150,000; group of buildings, \$400,000; School of Education building, \$435,000; Bartlett gymnasium,

\$210,000; temporary building (School of Education), \$24,000. The completion of these will increase the number of buildings on the campus to twenty-five, and will provide an addition of 70 per cent. to the room space furnished by the present buildings.

At the convocation exercises on June 18, honorary degrees were conferred on eleven men from various parts of the world who have done distinguished service in various fields of activity. Prior to this time only one honorary degree had been granted by the university—that was to William McKinley in 1899.

The absorption by the university of the Chicago Institute, recently founded by Mrs. Emmons Blaine, and the gift of \$1,000,000 to this new school, "The University of Chicago School of Education," by the founder, forms one of the valuable gifts to the institution for the year 1901. To this school will be joined the South Side Academy, an affiliated preparatory school, and the Chicago Manual Training School, a preparatory school of technology. The faculties of these various schools become members of the university staff.

The transfer of the freshman and sophomore classes of Rush Medical College to the university has increased the attendance by 230. This transfer did not affect the relation of the college and the university, the former being still only an affiliated school. The requirements for admission were materially raised by the transfer.

During 1901 the university received gifts, in the form of buildings and endowments, amounting to more than \$4,000,000. According to President Harper's quarterly statement of December 18, the general assets of the university for the year closing June 30, 1901, were as follows: Investments, \$7,603,691.55; buildings, \$2,207,366.71; grounds, \$1,244,067.53; cash and current assets, \$482,761.36; books, \$292,507.51; scientific equipment, \$391,700.81; furniture, \$66,228.09; material and supplies, \$66,137.22; printing-office plant, \$9,755.80; total, \$12,364,216.58; gifts received after June 30, \$1,628,437; total, \$13,992,653.58. The rate per cent. of income on the investments, which are divided among real estate, bonds, and stocks, for 1901 was 4.44 per cent. The current expenses for the year amounted to \$790,583.68. Of this amount \$410,750.50 were expended for instruction; \$69,357.85 for scholarships and fellowships; and \$26,915 for books. Of the receipts for the year the students' tuition bills furnished 41.2 per cent. and the investments 27.5 per cent.

The enrollment of students for the autumn quarter increased from 594 in 1892 to 2,431 in 1901. The freshman class, which in 1892 numbered 151, in 1901 numbered 444. The total enrollment in the elementary and secondary schools under the direct charge of the university numbered 869. The university has 291 names on the list of officers of instruction and administration. The statistics show an increasing proportion of women in the university each year. In 1900-01 there were 1,399 men and 1,247 women. President Harper has declared the policy of the university to be in favor of co-education. He says co-education is a permanent feature of higher education in the West, and that within a few years it will be so in the East. The four-quarter system, peculiar to the University of Chicago, was modified by closing all work on August 31, and thus giving one month's vacation. This was done to meet the demands of the large body of teachers who desire to attend during the summer quarter, but are compelled to leave by September 1. The change is likely to be a permanent one.

The history department has been strengthened by the appointment of Professor J. F. Jameson, formerly of Brown University, and editor of the *American Historical Review*, to the head of the department, and by the addition of \$25,000 worth of books to the historical library. The university has bought real estate, until now it owns the greater part of eleven blocks, five of which front on the Midway Plaisance between Ingleside Avenue and Monroe Avenue.

Plans are under consideration for the organization of a college of commerce and administration. Courses are already being offered in this college, but a separate faculty has not yet been organized. Arrangements have been made for a course of lectures extending through the entire year, to be delivered by prominent business men, acknowledged authorities in their respective fields.

The university senate has planned a series of publications which will set forth the intellectual growth of the first ten years of educational work. These memorial publications will constitute the president's report to the board of trustees, and will comprise ten volumes. These volumes will consist of the reports of heads of departments, scientific publications of members of the faculty, doctors of the university, and graduate students. Doctors' theses will be an important part of the work. The last eight volumes will consist of unpublished articles of a strictly scientific nature, under the general title of *Investigations*.

CHILDREN'S AID SOCIETY, organized in 1853 for the education of poor children, housing them in lodging houses, and procuring homes for them when desirable in rural districts. The society has provided houses and places of employment, since its organization, for 77,000 boys and girls and instruction to over

115,000, besides maintaining seven lodging houses for boys and girls respectively, under competent superintendents in various parts of New York City. The society in addition provides summer homes, a sick children's mission, a farm training school, a public laundry, and free reading rooms in the various lodging houses. Income for 1900: Received from city, \$155,176; from private contributors, \$128,990; from other sources, \$98,369—total, \$382,536. President, D. Willis James; secretary, C. L. Brace, United Charities Building, New York City.

CHILE, a South American republic extending along the Pacific coast from Peru to Cape Horn. The capital is Santiago.

Area, Population, etc.—The area of the twenty-three provinces and one territory comprising Chile is estimated at 266,652 square miles. The boundary dispute with Argentina, referred to the arbitration of representatives of the British government, had not been settled in 1901. The estimated population, exclusive of the Indians, who probably number about 50,000 was 3,110,083 on January 1, 1900. At the same time the estimated populations of Santiago and Valparaiso were 320,638 and 143,022 respectively. Immigration, though encouraged by the government, is small; from 1857 to 1897 the total number of immigrants was only 38,528, as against 2,275,521 to Argentina. The state religion is Roman Catholicism. There is a system of public education, including primary, secondary, higher, and professional instruction. The public primary schools in 1900 numbered 1,403, with an enrollment of 113,863 pupils and an average attendance of 72,690; in 1901 the public primary schools numbered 1,547. In the latter year about 9,000,000 pesos currency were appropriated for public instruction. There are various private schools.

Government.—The chief executive is a president, who is assisted by a council of state and by a ministry, which is responsible to the congress. On September 18, 1901, Señor Jerman Riesco was inaugurated president for the term ending in September, 1906. The legislative body is a congress consisting of a senate and a chamber of deputies.

The standing army in 1901 was fixed at a maximum of 17,385 men. The navy comprised 16 war vessels, 20 torpedo boats, 10 coast-guard vessels, 2 transports, and 10 pontoons or store vessels; the personnel comprised 5,260 men.

Finance.—Nominally the monetary standard is gold, and the unit of value is the peso, worth 36.5 cents in United States money. On July 30, 1898, the president was authorized to issue 50,000,000 pesos in paper, the conversion of which was to begin on January 1, 1902; in November, 1901, the government submitted to the congress a measure for the postponement of this conversion until October, 1903.

The largest item of revenue is export duties (chiefly on nitrate), import duties ranking next; by far the largest expenditure is interest on the public debt. The revenue and expenditure for the fiscal year 1899 were estimated at 100,572,937 pesos and 94,506,313 pesos respectively; in 1900, revenue 126,037,873 pesos and expenditure 112,708,571 pesos. The estimated revenue reported for 1901, including a surplus from the preceding year, was 123,104,051 pesos, and the authorized expenditure 129,319,793 pesos. It was stated, however, that this proposed expenditure would be scaled down to conform to the receipts. The customs receipts have been: 1899—on exports 47,245,169 pesos, on imports 21,368,586 pesos, total 68,613,755 pesos; 1900—on exports 50,161,598 pesos, imports 28,305,863 pesos, total 78,467,461 pesos. Of the export revenue in the latter year 49,679,017 pesos were duties on nitrate. At the beginning of 1900 the external debt amounted to £17,571,706, or 234,289,413 pesos; and the internal debt, including municipal debts, 75,964,770 pesos—total 310,254,183 pesos.

Industries and Commerce.—The principal industries are agriculture and mining, while stock-raising is of some importance. The most important single article produced is nitrate of soda. The production of this fertilizer in 1899 amounted to 31,312,580 Spanish quintals (1,443,201 metric tons), and in 1900 to 32,474,583 Spanish quintals (1,493,807 metric tons). An agreement entered into by the nitrate producers in November, 1900, and going into effect on April 1, 1901, fixes the maximum annual production at 30,500,000 quintals.

The imports and exports in 1891 amounted to 134,445,555 pesos and 138,703,823 respectively; in 1899, 106,260,358 pesos and 163,106,133 pesos respectively; in 1900, imports 128,812,115 pesos (\$46,916,422) and exports 167,674,636 pesos (\$61,201,242). In the last two years the exports of coin included in these figures were 2,595,577 pesos and 15,328 pesos respectively. A considerable decrease in imports in 1898, 1899, and 1900 was largely due to the economic crisis through which the country passed in 1898, and to the law that became operative on January 1 of that year, changing the custom duties. The leading imports in 1900 included: Coal (13,494,900 pesos), cotton and woolen goods, iron and ironware, and sugar (6,518,105 pesos).

The total reported mineral export in 1898 was valued at 126,742,641 pesos, and in 1899 at 137,637,603 pesos. The principal items included in the latter figure were: Nitrate, 1,380,718 metric tons, valued at 96,650,282 pesos; copper in various forms,

18,567,716 pesos; iodide, 4,108,427 pesos; silver, 3,778,175 pesos; gold, 2,461,234 pesos. In 1900 the articles classified as mining products were valued at 151,626,206 pesos; agricultural, 14,705,822 pesos; and articles re-exported, 1,343,607 pesos. The values of the principal exports in 1900 were: Nitrate, 31,549,653 quintals, valued at 109,945,156 pesos; copper in various forms, 23,016,468 pesos; iodide, 4,043,172 pesos; coal, 3,909,460 pesos; gold, 2,806,698 pesos; silver, 2,499,116 pesos. For the ten years, 1891-1900, the nitrate exported amounted to 876,813,238 pesos and the iodide 63,338,947 pesos. Of the nitrate exported, about 39 per cent. goes to Germany, 17.3 per cent. to France, 13.3 per cent. to the United States, 11.2 per cent. to Great Britain, and 10.9 per cent. to Belgium.

Great Britain stands first in the foreign trade, the imports from and the exports to that country in 1899 amounting to 44,338,050 pesos and 110,528,378 pesos respectively; Germany was second, sending goods to the value of 29,748,898 pesos and receiving to the value of 20,921,999 pesos; the United States, France, and Peru followed in the order named. In 1900 33.05 per cent. of the imports came from Great Britain, 26.70 per cent. from Germany, 9.41 per cent. from the United States, 7.24 per cent. from Australia, 7.22 per cent. from France, and 5.22 per cent. from Peru.

Communications.—The economic development of Chile, like that of all South American countries, is retarded by inadequate means of transportation. In 1901 there were 4,486 kilometres (2,787 miles) of railway lines, of which 2,186 kilometres (1,358 miles) belonged to the state. At the same time there were a number of lines in process of construction or survey. In the budget for 1901 about 23,000,000 pesos currency were appropriated for the construction and improvement of railways. On August 23, 1901, the Chilean hypothecary creditors of Clark's Transandean Railway (Chilean section) sold their rights to the Transandean Construction Company, Limited, for \$437,985; it was stated that for the settlement of various other interests involved an additional sum of \$535,315 was expended. It was thought that this transaction afforded "a guarantee for the speedy completion of this very important line of communication."

This line, when completed, will connect Valparaiso with Mendoza in Argentina. Of the 44 miles in Chilean territory, 18 have been completed. The Argentine section is 110 miles long; of these 89 miles were open for traffic at the end of 1901, 11 were nearly ready, while the roadbed of the remaining 10 miles was almost completed.

Events of 1901.—In March, 1901, the cabinet resigned. Señor Amunátegui Rivera, who had been minister at Montevideo, formed a Liberal ministry, which he said proposed to observe neutrality in the presidential election. Thereupon the chamber of deputies passed a vote of censure "on the ground that the cabinet was not sufficiently representative of the Liberal majority in congress." Señor Jermain Riesco had already been nominated as a Liberal for president, in opposition to Señor Pedro Montt, who was supported by the Conservatives and a faction of the Liberal party.

After a prolonged ministerial crisis a new cabinet was formed late in April, with Señor Aníbal Zanartu as premier and minister of the interior, and Señor Augusto Orrego Luco as minister for foreign affairs. Disorders in connection with the presidential election occurred in June at Valparaiso, Concepción, and Antofagasta. At the last-named place a procession of Señor Riesco's supporters was fired upon by the police, three persons being killed and others wounded. In the presidential election of June 25, Señor Riesco, who favored a sound currency, was successful. He was inaugurated on September 18. Meanwhile Señor Federico Errázuriz (*q.v.*), who had resigned the presidency (May 1) on account of ill-health, died on July 12. The vice-president and premier, Señor Zanartu, had assumed the executive functions, but resigned on September 2, and Señor Ismael Tocornal, who had become minister of foreign affairs, acted as chief executive for the remaining days of the term. A new cabinet was formed under Señor Barros Luco on September 11. It is stated that during the presidency of Señor Errázuriz Chile had more than thirty cabinets. On July 18 Señor Arias Sanchez, the Ecuadorian consul-general, was assassinated in Valparaiso.

In January, 1901, it was announced that the so-called Billingshurst-Latorre protocol, which was signed some two years before to provide for the manner of taking a plebiscite on the Tacna-Arica question, had been rejected by the Chilean chamber of deputies after passing both houses of the Peruvian congress and the Chilean senate. See SOUTH AMERICA.

The Argentine-Chilean boundary dispute, which, in pursuance of the agreements of April, 1896, and September, 1898, was given over to the arbitration of a British commission and which at the close of 1901 was still pending settlement, has been one of several causes that have brought a feeling of unfriendliness between the two republics. Consequently a new dispute, not within the jurisdiction of the British commission, arising in the fall of 1901, was attended by particularly bitter protests

from both governments. The territory in dispute was Ultima Esperanza, which lies between 51° and 52° south latitude and touches Worsley Bay, an inlet of the Pacific. This district, though in itself comparatively petty, is of considerable strategic importance, commanding to a certain degree the Strait of Magellan. The dispute arose from the fact that Chile, desiring to establish neutral roads in the district, attempted to drive out the Argentine police. Immediately friction became serious and the mobilization of the reserves of the two republics was begun. Late in December Chile proposed as a basis of settlement that she disavow all intention of treating her roads in the territory as evidence of previous rights of possession, and that Argentina withdraw from the doubtful territory all her officials. Argentina of course accepted the first clause of this proposal, but rejected the second. When both governments were on the point of breaking off diplomatic relations, they arrived at a settlement, temporary at least, in a protocol signed December 26, submitting the question to the arbitration of the British commission mentioned above. It must be pointed out, however, that Chile seems determined at any cost to keep Argentina away from Pacific waters. The boundary commission decided to send Sir Thomas Hildich, one of its members, to examine the geographical conditions of the territory in dispute.

CHINESE EMPIRE, an Asiatic monarchy lying between Siberia on the north and French Indo-China and British India on the south. The capital is Peking.

Area and Population.—According to the latest estimates the total area is placed at 4,234,910 square miles and the population at 399,680,000. These totals are made up as follows: China proper (the "middle kingdom" or "the eighteen provinces"), 1,353,350 square miles and 383,000,000 inhabitants; Manchuria, 362,310 and 7,500,000; Tibet, 651,500 and 6,000,000; Mongolia, 1,288,000 and 2,000,000; Jungaria, 147,950 and 600,000; East Turkistan, 431,800 and 580,000. At the beginning of 1900 the foreigners in China, about half of whom resided at Shanghai, numbered 17,193; of these 5,562 were British, 2,440 Japanese, and 1,621 Russian. See table in paragraph Commerce.

The three principal religions are Confucianism, the state religion, with the emperor as the supreme head, Taoism, and Buddhism, which has the largest number of adherents. Many of the people have mingled the three religions, and ancestor worship, which is particularly a feature of Confucianism, prevails throughout the empire. There are said to be about 30,000,000 Mohammedans, 1,000,000 Roman Catholics, and 50,000 Protestants. A small degree of education is general, but higher education, consisting chiefly of moral philosophy and classic Chinese literature, is given only to the class known as the *literati*. Theoretically any Chinaman, by passing the prescribed examinations, may be admitted to this class.

Government.—Governmental administration is carried on, under the emperor, by various councils or boards. The imperial authority is not hereditary, but descends according to custom to some member of the royal family of a younger generation, through appointment by his predecessor. The emperor in 1901 was Kwang Hsu, ninth ruler of the Manchu dynasty of Tsing, who succeeded the Emperor Tung-chi by proclamation in 1875. Kwang Hsu, belonging to the same generation as Tung-chi, who did not name a successor, was selected by the empress dowager, Tszu-Hszü, who acted as regent till 1887. In September, 1898, the empress dowager caused Kwang Hsu to give over to her the imperial authority, and since that time she has practically been the head of the state. The fact that Kwang Hsu is not of a younger generation than his predecessor was of some aid to the empress dowager when, on January 24, 1900, she named Pu Tsing, son of Prince Tuan, as the true successor of Tung-chi. On November 30, 1901, however, this appointment was rescinded. Kwang Hsu has never ceased to be regarded as the emperor. During the disturbances of 1900 the imperial court withdrew to Si-gnan-fu; it approached Peking at the end of December, 1901. Each of the eighteen provinces of China proper is governed by a viceroy, responsible to the imperial government.

Army and Navy.—The principal parts of the Chinese military forces are the "Eight Banners," largely Manchus, and the Ying Ping (the "Green Flags"), or national army. The first has nominally 300,000 men, of whom 80,000, or perhaps 100,000, are kept on a war footing. The second, which is scattered throughout the eighteen provinces, has a nominal strength of 540,000 or more men, of whom about 200,000 are available. The total army on a peace footing has been estimated at 300,000 men and on a war footing at 1,000,000 men. Before the outbreaks of 1900 a British army officer estimated the number of "fighting troops" at 205,000 and "reserves under arms" at 689,000. Discipline and equipment have been very poor, but since 1898 the government has endeavored to improve the army's effectiveness by the introduction of European methods and arms; this improvement continued in 1901, and in that year also the Chinese factories turned out large amounts of arms and ammunition for the troops. The navy consists of four armored cruisers, three small cruisers, a torpedo cruiser, and a torpedo boat.

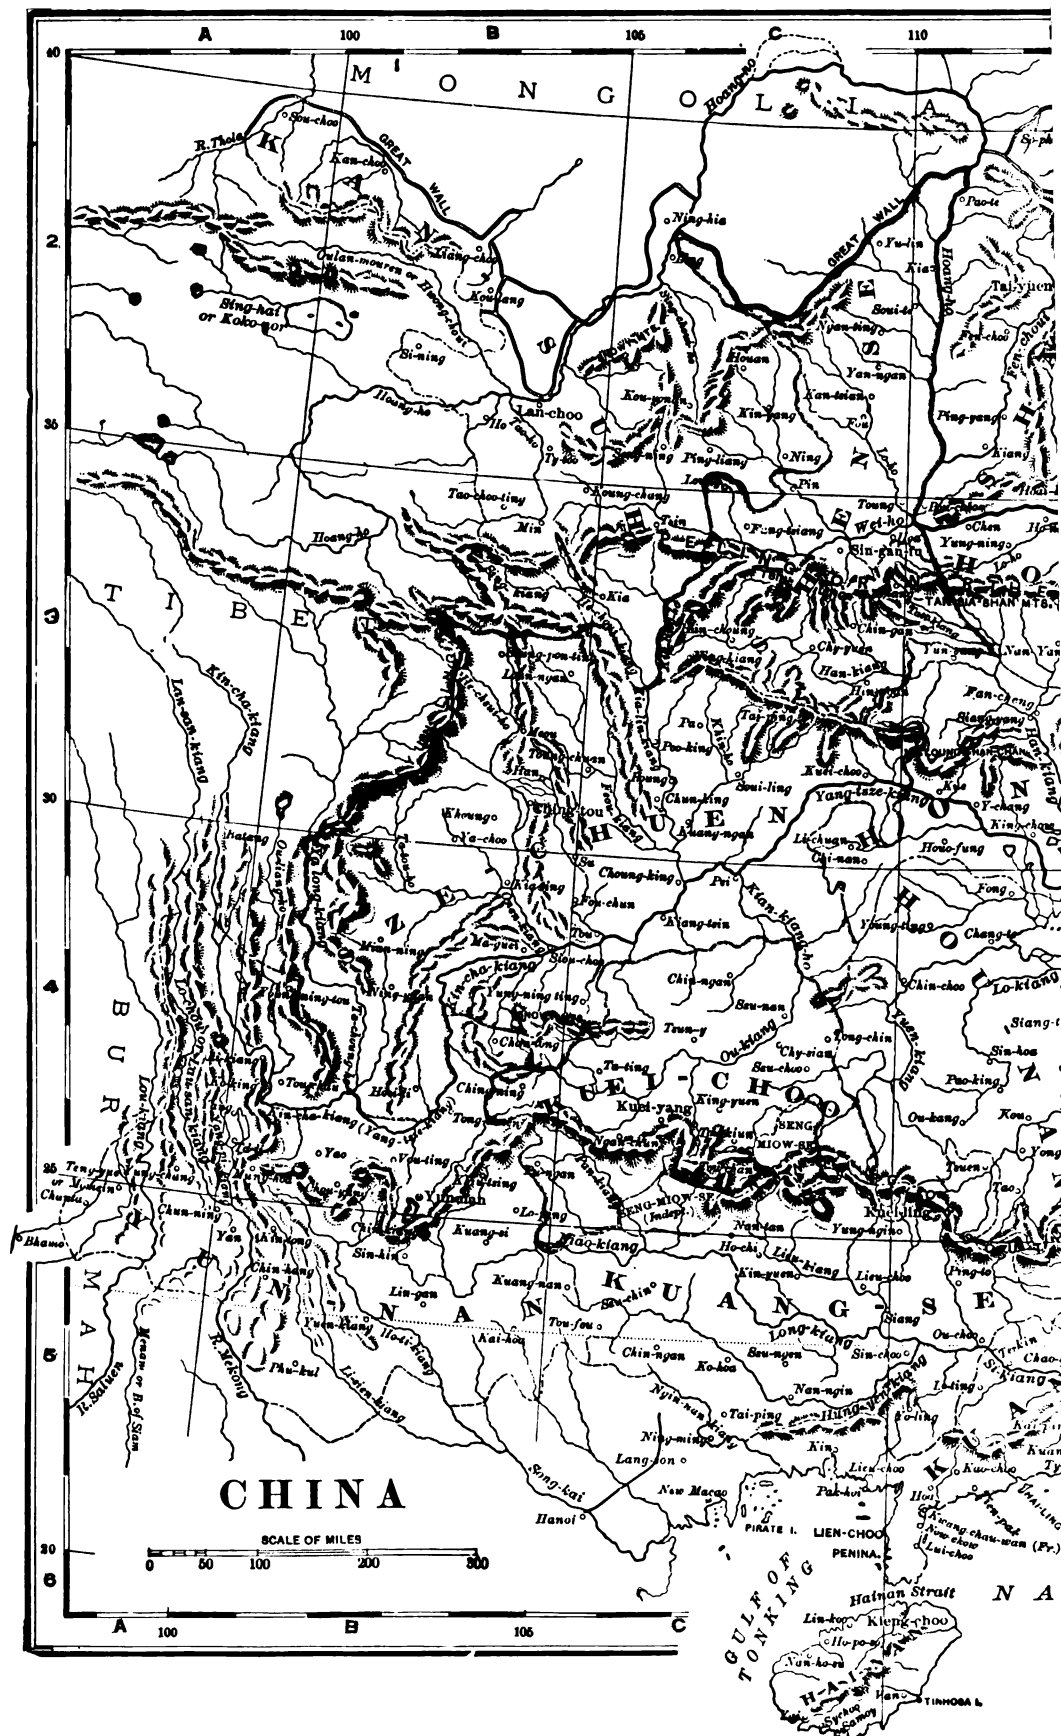

Finance.—The Chinese government makes no complete statements of finance, but

the annual revenue and expenditure are unofficially estimated at from \$60,000,000 to nearly \$75,000,000. The largest sources of revenue are the foreign maritime customs (under British management), about \$12,000,000, and the land tax, about \$14,000,000; and the largest expenditures are for service of the debt, war, and provincial administration. (For customs receipts see table in paragraph Commerce.) In 1900 the outstanding foreign debt amounted to about \$262,790,000. As a result of the negotiations with the Powers in 1901, the debt was increased by an indemnity amounting to 450,000,000 haikwan taels, or \$333,900,000, the value of the tael being fixed by the negotiators at 74.2 cents. Accordingly, the total foreign debt may be placed at about \$596,690,000.

Commerce.—Foreign commerce passes through thirty-four treaty ports and is supervised by the imperial maritime customs, which since 1885 have been under the direction of Sir Robert Hart. The report issued by this bureau for 1900 contains the latest available figures of commerce for a full calendar year. The year 1899 showed the largest trade returns on record, and the early months of 1900 were indicative of continuing prosperity. Then came the Boxer outbreak, for a few months almost annihilating commerce in the north and disturbing trade conditions throughout the country. Later, however, reaction set in and the year ended with considerable promise. Indeed, a much greater falling off in trade than actually took place might reasonably have been expected. "That trade was not more ruinously impeded," wrote the American secretary of legation at Peking, "always excepting the actual area of hostilities, during a year which was so exceptionally trying to merchants and so full of unrest for the populace, shows its vitality and how quickly it will revive when peace is restored." Notwithstanding the unfavorable conditions in 1900, the imports for that year slightly exceeded those for 1898, while the exports fell below the latter year by only about 3,849,000 haikwan taels. The values assigned to imports and exports are the actual market prices in the Chinese ports; the true values, therefore, are for the imports the value "at the moment of landing" and for the exports the value "at the moment of shipping." That is, from the reported value of imports should be deducted the import duty and expenses of landing, storing, etc.; and to the reported value of exports should be added the export duty, the importer's commission, and expenses of shipping, etc. When such subtractions and additions are made, the value of imports for 1899 becomes 233,953,853 haikwan taels and of the exports 217,610,004 haikwan taels; while for 1900 the values become about 185,870,000 haikwan taels for imports and about 176,680,000 haikwan taels for exports.

The table given herewith shows the market value of trade, exclusive of bullion, by countries, in haikwan taels and equivalent United States gold, as reported by the maritime customs for 1899 and 1900. It should be stated, as the United States

consul-general at Shanghai has pointed out, that "the customs credit the trade to the country from which and to which the carrying ship clears, without taking any note of the country in which the goods originated or for which they are destined." For example, goods shipped via Hong Kong are credited to Hong Kong, via London to Great Britain, via Japan to Japan, etc.

The reported value of the imports of cotton goods fell from \$74,457,406 in 1899 to \$54,519,603 in 1900. Some of the principal items included in these totals were, for 1899 and 1900 respectively: Indian yarn, \$26,205,428 and \$13,847,900; Japanese yarn, \$12,177,203 and \$7,239,082; gray shirtings, \$8,108,850 and \$8,116,424; white shirtings, \$5,838,728 and \$5,704,660; American sheetings, \$6,924,070 and \$4,494,469; American drills, \$3,037,631 and \$1,694,711; lastings, \$2,386,797 and \$3,636,661; T cloths, \$1,675,166 and \$1,247,366; English sheetings, \$1,364,302 and \$1,157,161. Other leading imports were valued in 1899 and 1900 respectively: Opium, \$25,788,689 and \$22,366,905; woollen goods, \$3,008,550 and \$2,466,700; raw cotton, \$2,504,299 and \$1,321,019; machinery, \$1,099,879 and \$1,045,081; tin in slabs, \$1,054,856 and \$1,374,128; American kerosene, \$4,684,539 and \$4,543,570; Russian kerosene, \$3,524,239 and \$3,710,183; Sumatran kerosene, \$858,906 and \$1,804,035.

The movements of gold and silver bullion recorded by the customs between China and foreign countries in 1900 showed a net import of gold worth 1,202,315 haikwan taels (\$866,508) and a net import of silver worth 15,442,212 haikwan taels (\$11,129,202). Large amounts of British, French, and Mexican silver coin were brought by the foreign military. It was reported in 1901 that in Manchuria dollars were taking the place of sycee as currency.

China's most valuable export—raw and manufactured silk—which amounted to \$59,195,781 in 1899, seriously decreased in 1900. The crop was satisfactory, but the anticipated consumption resulting from the Paris Exposition was not fully realized, while "overproduction in Europe and America caused a weak demand and low prices," and at the same time Japanese competition was severe. In 1901 there was little prospect of an immediate improvement in the silk market. The export ranking second in value is tea. In 1885 the shipments amounted to 283,833,800 pounds; the export fell to 204,286,700 pounds in 1897, increasing slightly in the following year, and in 1899 reached 217,439,300 pounds. In 1900 the shipments declined to 184,382,110 pounds. The last amount was made up as follows: Black tea, 115,016,533 pounds; brick, 42,245,836; green, 26,716,652; tablet, 403,089. Of raw cotton nearly 95,000,000 pounds were exported in 1900, and the exportations of hides, horns, tallow, oils, nutgalls, rush hats, and straw braid increased.

Some idea of the relative importance of foreign trade carried on at each treaty port may be gained from the following table, which states in American gold the imperial customs revenue for 1899 and 1900; the total amounts, \$19,209,582 and \$16,485,281 for the two years respectively, correspond to 26,661,460 haikwan taels and 22,873,985 haikwan taels, the figures reported by the customs.

			Total	1,006	16,881

The Boxer uprising of 1900 almost destroyed, temporarily, foreign trade in northern China. Since this part of China is practically the field of American trade, perhaps no country in the world suffered more than did the United States. The year 1900 began with the greatest increase in American trade in China on record, and "ended with the most serious losses." The greatest American loss was in piece goods and in kerosene. Some idea of the disastrous effects on trade of the Boxer outbreak may be gained from the following figures comparing the amounts of American importations at the three northern ports of Chifu, Tientsin, and Niuchwang for quarters ending June 30 and September 30 in 1899 and in 1900. The first table relates to quarters ending June 30 and the second to quarters ending September 30.

Article.	1899.	1900.	Increase.	Decrease.
Jeans (pieces)	25,885	14,270	11,615
Drills (pieces)	504,578	219,398	285,180
Sheetings (pieces)	1,051,805	1,052,635	599,170
Kerosene (gallons)	2,339,040	3,544,530	1,205,490

Article.	1899.	1900.	Increase.	Decrease.
Jeans (pieces)	22,930	3,340	19,590
Drills (pieces)	371,172	20,589	350,583
Sheetings (pieces)	839,480	81,790	757,690
Kerosene (gallons)	2,053,100	50,000	2,003,100

The increase of the kerosene import for the quarter ending June 30, 1900, was due to the trade at Chifu, where the other articles enumerated also showed advances for that quarter, but in the following quarter there was a general decrease. And the returns at Tientsin and Niuchwang for the quarter ending September 30, 1900, showed almost the annihilation of trade at those ports. For the last-named quarter the customs receipts at these three ports amounted to 238,506 haikwan taels, against 809,308 haikwan taels in the corresponding period of 1899; and the customs revenue for all China during the one quarter was 5,163,795 haikwan taels and during the other quarter 7,623,386 haikwan taels.

The total imports from the United States in 1900 were valued at 16,724,493 haikwan taels (\$12,053,342) and the total exports to the United States at 14,751,631 haikwan taels (\$10,631,500). These totals, however, on account of the method of recording used by the customs, which was pointed out in a foregoing paragraph, are far from showing the true value of American goods bought in China and *vice versa*. Careful estimates made by the United States consul-general at Shanghai led that official to believe the value of American imports in 1900 exceeded \$18,000,000, while the difference with regard to the exports was proportionally even greater. It may be fairly assumed, then, that "the United States buys more goods from China than does any other nation," and that the total American trade with China exceeds that of any other country except Great Britain. In the spring of 1900 the most rapidly growing trade in China was the American, but a year later German trade was proportionally increasing faster.

Railways and Telegraphs.—In China proper there are three lines of railway in operation: the Chinese Imperial Railway (built by British capital); the line from Peking to Pao-ting-fu (built by British capital, but since January, 1900, in the hands of a Belgian syndicate, which some suppose is acting for Russia); and the line from Shanghai to Wusung (British). The last named is only 12 miles long. The Chinese Imperial Railway extends from Peking to Tientsin (80 miles), thence to Tong-ku (27 miles), to Shan-hai-kwan, on the Manchurian border (147 miles)—total, 254 miles. The railway from Peking to Pao-ting-fu is 88 miles long and has a branch of 10 miles. From the foregoing it appears that the completed railways in China proper have a total length of 364 miles. Two railways are under construction: the so-called Peking-Hankow line and the Shantung line. The former line, which is being built by the same Belgian syndicate that controls the line from Peking to

Pao-ting-fu, will connect the latter town with Hankow. At the end of 1901 work on this line was progressing steadily; though much damage had been done by the floods of the preceding summer, rails had been laid in November a distance of 165 kilometres (103 miles) north from Hankow, and the work was advancing at the rate of about half a kilometre a day. The Shantung line is being constructed by the Germans inland from Kiao-Chau. In September, 1901, about 100 kilometres (62 miles) were completed, and it was expected that by May, 1902, the line would be in operation as far as Weihien, where the great land routes of the southern part of Shantung converge.

Among the more important lines projected in China proper, but not begun at the end of 1901, are: Hankow to Canton (projected by an American syndicate); Canton to Woohang (American and British); Shanghai to Nanking (British), 250 miles; Lao-kai to Yunnan-sen (French), 291 miles. See *INDO-CHINA, FRENCH*.

Outside China proper are the extension of the Chinese Imperial Railway and the Russian lines in Manchuria. The former runs from Shan-hai-kwan (193 miles) to Niuchwang, there connecting with the Chinese Eastern Railway (Russian); near Chen-chou, 113 miles from Shan-hai-kwan, there are two branches, 7 and 30 miles in length respectively. The Chinese Imperial Railway, with the 254 miles in Chili, has a total length of 484 miles. The section of the Russian Siberian line from Vladivostok across Manchuria was opened November 3, 1901 (see *RUSSIA*). Harbin, on the Manchurian railway, is to be connected with Port Arthur, 653 miles distant. In 1900, 318 miles of this line, running north from Port Arthur through Niuchwang to Telin, near Mukden, were completed.

All the principal cities of China are connected by telegraph, and Peking has overland connections with Europe. The telegraph lines have a length of about 14,000 miles, and new lines are being constructed.

HISTORY.

The Peace Protocol Negotiations.—In the last days of December, 1900, the joint note, embodying the terms upon which the peace protocol was to be negotiated, was signed by the representatives of the powers at Peking, and presented to the Chinese commissioners, Li Hung Chang and Prince Ching. The United States representative, Mr. Rockhill, suggested that the consideration of the indemnity and the question of commercial treaties be transferred to some other capital than Peking, preferably Tokio or Washington, but the proposition was not accepted by the other Powers, and on January 12, 1901, the Chinese commissioners signed the preliminary note submitted to them, and negotiations began. The imperial edict authorizing the commissioners to sign the note, expressed the hope that the sections prohibiting the importation of arms or military goods, the demolition of the Taku forts, the establishment of legation guards, and the section relating to the indemnity would be modified. Early in the negotiations a request was made by Prince Ching and Earl Li for the transfer of the Forbidden City to the Chinese in order that preparations might be made for the emperor's return. The request was denied by the ministers on the ground of a previous decision that no concessions whatever should be granted the Chinese until they had shown by their deeds a compliance with the terms laid down in the preliminary note. The first joint session of the foreign envoys and the Chinese commissioners, whose number had been increased to four by the addition of Sheng, mayor of Shanghai, and Chou-fu, former Chinese minister to Korea, as advisory members, took place on February 5.

The Discussion of Punishments.—The first section of the note, providing for expiatory missions to Japan and Germany, was accepted without debate, but the second, providing that the "most severe punishment befitting their crimes" should be inflicted by the Chinese on certain persons designated by the ministers as responsible for the outbreak and outrages of 1900, gave rise to prolonged discussion. At the first session the envoys submitted a list of twelve Chinese officials, guilty of crimes against international law, whose punishment was demanded. On February 6 the foreign ministers decided to demand the infliction of the death penalty on every man on the list presented, notwithstanding the fact that the wording of the preliminary note had been changed, at the instance of the United States, from "death penalty" to "most severe punishment." The Chinese commissioners were willing to give assurance of the execution of Prince Chuang, the commander-in-chief of the Boxers, and of Yu-Hsien, one of his chief lieutenants, but urged leniency for the others, particularly Prince Tuan, Duke Lan, and General Tung Fu-hsiang, the commander-in-chief of the Chinese army. After some discussion the envoys consented to a commutation of the death penalty in the cases of Tuan and Lan to perpetual exile, it being understood, however, that sentence of death should first be passed upon them. The final agreement, reached on February 20, was in the nature of a compromise. According to this arrangement the imperial court was to commute the sentences of Tuan, Lan, and Tung to life imprisonment, to allow Chuang to be strangled instead

of decapitated, and to allow the others to strangle themselves or be beheaded. A month later (March 18) an additional list of 96 minor officials, charged with complicity in the outrages, was presented by the envoys with recommendation that they be punished as the Chinese should see fit, both the United States and Japan recording themselves as opposed to any further "unnecessary bloodshed."

Indemnities.—By far the most puzzling question before the envoys was that of the amount of the indemnities to be paid, both to natives and to private individuals and societies or corporations. Discussion of the matter was taken up about the middle of March, 1901, and immediately the greatest diversity of opinion was exhibited, both as to the amount to be demanded and the provisions for securing its payment. The question of the private claims, however, not being covered by the protocol was only discussed in a general way. At the outset there was radical difference of opinion among the representatives of the powers as to the amount that China could and ought to pay. The United States urged that the total indemnity be not more than \$200,000,000, and in her stand for a low figure was supported by the Japanese and British ministers, whose minimum estimates, however, were somewhat larger than that of the United States. The demands of Russia, Germany, and France, however, were absurdly high. The United States, seconded by Great Britain, announced it as a part of her policy to favor a low indemnity, being willing even to reduce this amount in exchange for guarantees for the safety of foreigners and the extension of trade and commercial privileges. It was held by these nations that it would be for their own benefit as well as China's, not to demand an indemnity that would cripple China and leave her practically bankrupt, possibly rendering her even unable to complete the payment of the indemnity. Such a failure to pay would probably be followed by more international wrangling and even by seizure of territory in lieu of defaulted payment, an act which would open the way for a general partition of China among the Powers. Germany and France in particular were probably favorable to the plan for this very reason; but the position of Russia, which is not ready for a partition until her development of Siberia is more complete, was not so certain. The aggregate amount of the various claims, as originally submitted, amounted to between \$400,000,000 and \$500,000,000. The original plan for the payment of a separate sum to each country, according to its demands, gave way after discussion to the plan proposed by Mr. Rockhill, that payment be made in a lump sum, and the share of each nation be thereafter assigned by the ministers, an international commission, appointed for the purpose, or the Hague Tribunal.

A statement of the American policy, which was understood to be framed on practically the same principles as that of Great Britain and Japan, was officially presented to the other envoys. The statement favored the payment of a lump sum to be kept within the limit of \$200,000,000, if possible, and to be afterward divided proportionately among the claimant Powers by the Hague Tribunal. This statement of policy was submitted as a formal proposition and was finally rejected, except so much of it as provided for the payment in gross. On May 9 the envoys addressed the Chinese government in a collective note, informing it that the Powers would require for losses and expenditures until July 1, 1901, the sum of 450,000,000 taels (at the rate of exchange then existing equal to about \$337,000,000). An official admission of liability on China's part was requested. The Chinese reply was given on May 12. It accepted the obligation to pay adequate compensation contained in the preliminary note, but expressed amazement at the amount demanded and urged a considerable reduction. If the full amount were insisted upon, however, China would undertake, so the commissioners replied, to pay the 450,000,000 taels in 30 annual installments of 15,000,000 taels each, payment to be made by raising 10,000,000 taels from the salt tax, 3,000,000 from native customs, and 2,000,000 from inland transit duties. The Chinese commissioners further proposed an average increase of 15 per cent. in import duties, a proposition which the envoys would not entertain, although all were willing that there should be some increase in customs duties. On this proposal, Russia, France, Germany, and the other nations whose commerce with China is comparatively insignificant urged an immediate increase of 10 per cent., while Great Britain, Japan, and the United States favored an effective increase of 5 per cent., holding that an arrangement to pay the indemnity by a large increase of the customs on imports would really mean that the Powers which demanded the least indemnity would pay those which demanded the most. The reply of the commissioners accepting the envoy's indemnity proposals was followed by an imperial decree on May 27, declaring China's unconditional acceptance. That point being settled, the envoys set themselves to determining how China should be allowed to raise the indemnity, and by what methods its payment should be guaranteed. Among the Chinese themselves there appeared to be no clear agreement as to how the money should be raised, the imperial government favoring an increase in internal taxes and transit and salt charges—in other words, the provincial revenues; while the Yang-tse viceroys not unreasonably replied that they took no part in the Boxer uprising, and

that the chief pecuniary burden properly belonged to Peking and the province of Chili

When the question of the guarantee of the indemnity came before the envoys, France and Russia proposed a joint guarantee, which was vigorously opposed by Great Britain and the United States, who also joined in opposition to Russia's tariff proposal, with the result that late in June an agreement was reached to the effect that the Chinese method of payment should be by issue of her bonds, and that the security should consist of an increase of the tariff on imports to an effective 5 per cent. specific duty on all articles then nominally subject to that rate by treaty, or which should be added to it by an international commission, it being understood that cereals should be free. Native customs, the salt tax, and maritime charges were to constitute a further guarantee. On July 26, after fully four months of discussion, the final terms of the agreement relating to the indemnity were decided upon. The amount of 450,000,000 taels will bear interest at 4 per cent., payable semi-annually, payment of the principal to begin in 1903, and continue in increasing installments until 1940, at which time the indemnity obligation shall have been satisfied. The total payments of principal and interest will amount to almost \$700,000,000. Payments will be made to a mixed committee at Shanghai, to be known as the Committee of Encashment, and to be composed of representatives of foreign banks in that city.

The Protocol.—The final draft of the protocol was signed by the representatives of eleven Powers at Peking on September 7, 1901. The signatory Powers were Russia, Germany, France, Great Britain, the Netherlands, Belgium, Spain, the United States, Japan, Italy, and Austria-Hungary. The text of the protocol consisted of a recital of the compliance of China with the conditions laid down in the preliminary note. It may be summarized as follows, the articles corresponding with those bearing the same numbers in the preliminary note:

Article 1. (a) The agreement to atone for the assassination of Baron von Ketteler, the German ambassador. (Fulfilled by the mission of Prince Chun to Germany.) (b) Acquiescence in the demand that a memorial monument be erected to Baron von Ketteler in Peking.

Article 2. (a) Punishments inflicted in accordance with the demands of the Powers. (b) Suspension of official examinations for five years in all cities where foreigners were massacred.

Article 3. Atonement for the murder of Chancellor Sugiyama, of the Japanese legation, by an expiatory mission to Tokio.

Article 4. Agreement to erect expiatory monuments in desecrated foreign cemeteries.

Article 5. The importation of arms and war materials into China prohibited for two years

Article 6. Agreement for the payment of an indemnity of 450,000,000 taels, and provisions for its payment and guarantee, the value of the tael being fixed at 74.2 cents

Article 7. The fortification and garrisoning of the foreign legations provided for.

Article 8. Destruction of the Taku forts promised.

Article 9. Garrisons of foreign troops to be maintained on the road from Peking to Taku.

Article 10. Provision made for the publication throughout China of imperial edicts providing (a) prohibition of membership in anti-foreign societies; (b) for public announcements of the punishing of the Boxers; (c) for the suspension of examinations; (d) for placing responsibility for disturbances on provisional governors and local officials.

Article 11. Extension of treaties of trade and commerce.

Article 12. Reformation of the Tsung-li-Yamen and agreement as to the evacuation of Peking.

The Manchurian Question.—The attempt of Russia to establish a protectorate over Manchuria was, aside from the peace settlement itself, probably the most important and significant occurrence in the history of China in 1901. An agreement between the Chinese military officials and the Russians at Mukden, reported on the last day of 1900, provided for a resumption of Chinese civil government in Feng-Tien, the southern province of Manchuria, under what amounted to practically a Russian protectorate with full military occupation. Count Lamsdorff, the Russian minister for foreign affairs, however, replying on February 17 to an inquiry of Lord Lansdowne, the British minister for foreign affairs, as to the nature of the agreement, disavowed any intention on Russia's part to establish a protectorate, and declared that "nothing beyond the terms of a temporary *modus vivendi* during the occupation of the Russian troops was being negotiated." The Russian idea of a "temporary *modus vivendi*" was made known to the world on the publication of the text of the proposed "agreement" on February 27. The agreement provided for a

Chinese civil administration under the protection of the Russian army, that no army should be maintained there by China until after the completion of the Manchurian railway, and then only such an army as Russia might advise; that Chinese officials guilty of hostility to Russia should be degraded; that no foreigners (other than Russians should be employed in the military or naval service in the "northern provinces;" that without Russia's consent, no mining, railway, or other rights should be conceded in any Chinese territory bordering on the Russian possessions, nor should China itself build such railways, but should confirm the existing concessions for the Manchurian-Peking railway and other Russian projects. Such was the situation, when on March 23, 1901, China formally appealed to the various Powers to intercede for her against Russia's claims. Thereupon it was suggested by Germany that any Russo-Chinese agreement entered into during the pendency of the negotiations, before being ratified, should be laid before the ministers at Peking. To this proposal Russia, however, would not agree. This action of Germany, on the other hand, placing her in line with the policy already known to be that of Japan, Great Britain, and the United States, brought matters to a climax, and on April 5 it was announced by M. Paul Lessar, then Russian ambassador at London, that it was "the intention of the Russian government not to proceed with the Manchurian agreement, but to await the development of events, remaining faithful to the programme which they had followed from the beginning."

Toward the end of June, interest in the question was revived by the report that M. de Giers, then Russian minister at Peking, was pressing the Chinese government to reopen the question of an agreement as to Manchuria as soon as the protocol should be signed. No attempt to deny this report was made by M. de Giers. In explanation and defense of Russia's position he stated that the previous objection of the Powers, to which Russia had given way for the time being, was based by them on the contention that Russia ought not to carry on with China joint negotiations with the other Powers and at the same time separate negotiations on her own account. This objection, he declared, would cease with the signing of the final protocol. The necessity for some sort of an agreement to reestablish peace and order in Manchuria was acknowledged by the other Powers, and it was further agreed that Russia's railway and other interests in the region were so important as to give her certain special rights and privileges in any arrangement made. That her interests, however, gave her any right to establish a protectorate over the country, maintain an army there indefinitely, or demand a practical monopoly of trade and traffic rights, the Powers were almost unanimous in denying. In October, 1901, it was announced from Peking that M. Paul Lessar, who had succeeded M. de Giers as Russian minister to China, had completed negotiations with Li Hung Chang for a new convention in regard to Manchuria on the lines of the agreement abandoned in April. Although the text of the new treaty was not made public, it was generally understood that the terms were much more favorable to China than those of the previous treaty, and provided for the definite withdrawal of Russian troops from three of the provinces within a year and the restoration of the Shan-hai-kwan-Niuchwang railway to Chinese control. Enough of the objectionable features of the April agreement remained, however, to cause the other Powers interested to await, with considerable impatience, China's action upon the treaty; and, although it does not appear that any actual pressure was brought to bear to bring China to reject the Russian proposals, it is probable that she knew the Powers were as much opposed to the new arrangement as to the previous one, and would sustain her if it were rejected. Prince Ching was known to be opposed to the acceptance of the terms, and on the death of Li Hung Chang on November 7, it was officially announced that no agreement had then been arrived at, and that negotiations would be discontinued for the time being. In the latter part of November they were resumed, but no settlement had been reached by the end of 1901. Whether Russia will continue to insist on a virtual protectorate over Manchuria in the face of this opposition remains to be seen. The very fact that her interests in the region are so great make it appear unlikely that she will take any action that will disturb the existing peace. But Russia's ultimate possession of Manchuria, which forms the natural connection between Siberia and the open waters of the Pacific, seems a certainty; as an English writer, Mr. Archibald Colquhoun, puts it, "It is as impossible for Russia to abandon Manchuria as for England to abandon Egypt." Meanwhile, pending an agreement, the Russian army remains in the country and Russian officials administer the government.

Military.—The year 1901 opened with the armed forces of the allied Powers still in complete control of Peking, Tien-tsin, and the connecting road, and it was announced that no part of this force would be withdrawn until China had shown a compliance with the terms of the preliminary note. At the same time China was given to understand that the Powers were anxious to be relieved of the responsibility attached to the occupation, and that its continuance was simply an item of expense which China would be called upon to settle. The military operations of the allies

in the early months of the year, although frequent, cannot be considered as constituting a definite campaign. The expeditions generally accomplished the purpose for which they were sent out, namely, to quell Boxer uprisings in various districts. They also had the effect of impressing the imperial government and the Chinese people with the fact that the allied Powers still controlled the affairs of the nation. Unhappily the action of some of the expeditionary forces created another impression, and one that could scarcely be said to produce on the Chinese mind a favorable idea of western civilization. This was the impression created by the excesses and outrages committed in particular by the French and German troops. The forces of the United States, Great Britain, and Japan, from all reports, appear to have been practically above criticism in this respect. On February 18, 1901, Field-Marshal von Waldersee, the commander-in-chief of the allied armies, notified the generals in command of the various forces to prepare for an eighty-day campaign in the interior. It was understood that the expedition was to be in the direction of Si-gnan-fu, the temporary capital, for the purpose of forcing the court, if possible, to hasten negotiations. General Chaffee, the American commander, following the lines of the policy announced at Washington, refused Count von Waldersee's invitation, stating that the United States disapproved of further military operations, save such as were actually necessary to protect the lives and property of foreign residents, and notifying him at the same time that all the American troops, except a legion guard, would be withdrawn at an early day. Russia, too, forbade her troops to take part in the proposed campaign, and the reply of the British commander was non-committal. A week later it was announced that the expedition had been postponed, but its mere proposal seems to have had the desired effect of hastening the negotiations. During the month of March, however, both German and French troops engaged in "punitive expeditions," some of them of considerable magnitude, and complaints of outrages committed by the troops continued.

On March 15, 1901, friction was reported between the Russian and British troops at Tien-tsin. The dispute arose over the claim of Russia to a considerable area on the left bank of the Pei-ho, the occupation of which by Russian troops had been ratified by China. The land, however, comprised a large tract belonging to the North China railway, a British company. The presence of British workmen under protection of British troops was resented by the Russians as a trespass, and for a few days the outlook was serious. The governments of both nations, however, showed a conciliatory spirit, and on March 21 the proposal of Count Lamsdorff, the Russian minister for foreign affairs, that all questions of title and proprietary right be reserved for later examination by the two governments, and that meanwhile the troops of both nations be withdrawn, was readily accepted by Lord Lansdowne, and further trouble was averted.

Late in April a combined French and German expedition was organized to operate against the Chinese general, Liu, in the province of Shan-si. At the last moment the French contingent was withdrawn and the German force proceeded alone, inflicting several severe defeats upon the Chinese. The expedition was criticised as entirely uncalled for, and it was declared by the English press that the policy of Von Waldersee was more likely to prevent than to hasten the restoration of order.

General Chaffee and the American troops, with the exception of Company B, Ninth Infantry, which was retained as a legion guard, left Peking on May 5, 1901, and sailed for Manila on May 22. The Russian and Japanese troops were withdrawn gradually during the month of May, and by the middle of June a considerable portion of the French and German armies had been withdrawn. Count von Waldersee left Peking on June 3. On September 17 the control of the city of Peking was formally transferred to China, all the troops except the legion forces being withdrawn by that date. Of the remaining foreign troops in China a part, according to the terms of the protocol, are to occupy stations on the road from Peking to Taku, to provide, it is said, for the escape of the legations in case of a revival of the conditions of the summer of 1900, and somewhat larger forces are to be maintained in the foreign sections of Tien-tsin. During the summer the British, French, German, and Italian legations in Peking were rebuilt into actual fortresses and machine guns mounted within them. It was announced that the British troops in China would consist of 1,800 men at Peking and 3,000 more scattered from Peking to Taku. The German army of occupation was announced to consist of 4,000.

American Policy in China.—The diplomacy of the United States in regard to China has been noteworthy, not only because of its clearness and entire lack of arrogance or disposition to "grab," but because of the really important part it played in shaping the policy adopted by the allies. While this has undoubtedly been much exaggerated by the American press, it is nevertheless true that many of the most important points in the policy of the allies during the negotiations were "made in America." These were largely in the line of compromises or of greater leniency toward the Chinese, suggestions which the other Powers were more ready to adopt

because of the evidently sincere official denial of the United States of any desire for territorial acquisitions within the borders of the Chinese empire. From the very first the United States stood out strongly against any policy that tended toward a partition of the empire, or an abandonment of the "open door" policy as to foreign trade. Again, American diplomacy insisted on the importance of helping China in every possible way to maintain her place as an independent nation. For this reason the influence of the United States was exerted in behalf of allowing China herself to punish those connected with the Boxer uprising, holding that it would be a disregard of her independence to take the punishment out of her hands. When this policy had been adopted, and the negotiations further complicated by the fact that China objected to the insistence of the Powers on the death penalty for the offenders, the United States secured, as a concession, the privilege of allowing China to impose as well as inflict the penalties herself. When the question of the indemnity arose, the United States suggested the payment in gross, and, together with Great Britain and Japan, held that it would be bad policy to cripple China by the imposition of an indemnity which she would be unable to pay, but that it was to the interest of all concerned to insure rather than undermine her financial stability. On almost every point under discussion American policy was of the most conservative sort, and the good faith and sincerity of the United States was nowhere more clearly shown than in its stand in regard to punitive expeditions and the question of the military occupation. At the close of 1901 negotiations were in progress looking toward the securing of a concession at Tien-tsin for an "American quarter." On December 27, at a cabinet meeting, the International Banking Company, a Connecticut corporation, organized to establish banks in foreign countries, was designated as the fiscal agent of the United States in China, and its branch at Shanghai was authorized to collect the payments due on the indemnity. A St. Petersburg dispatch stated unofficially on December 31 that Sir Robert Hart, the Anglo-Chinese financier, and two Americans, Mr. W. W. Rockhill and former Secretary of State John W. Foster, had been appointed official advisers to China in foreign affairs.

The Situation at the Close of 1901.—In spite of many defects in the protocol, and the likelihood that many of the reforms promised would not be effective, the situation in China at the close of the year was encouraging. Practically all the terms imposed by the Powers had been complied with. The murder in June, 1900, of Baron von Ketteler, the German ambassador, had been atoned for by the mission to Germany of Prince Chun, the emperor's brother, who apologized to the kaiser personally at Potsdam. The killing, also in June, 1900, of Chancellor Sugiyama, of the Japanese legation, was expiated by a similar mission to Tokio. On July 24, 1901, an imperial decree, as provided for in the preliminary note, abolished the Tsung-li-Yamen, the old council on foreign affairs, and established a single-headed ministry of foreign affairs, the Wai-wu-pu, in its stead. The position of the empress-dowager, while much more favorable to reform than ever before, was still considered something of a menace to continued peace. The article in the protocol providing for the publication of imperial decrees throughout the empire and the edict against membership in anti-foreign societies, were looked upon as matters of considerable importance if such edicts could be properly enforced.

As to the position of the nations in China at the close of the year it may be said that on the whole, Russia, France, and Germany, whose demands on China were most exacting, have been distinctly gainers as a result of the negotiations, while the interests of Great Britain, Japan, and the United States, who stood together for a moderate treatment of the Chinese, have suffered. Russia's gain lies chiefly in the strengthening of her hold in Manchuria although the final disposition of that question was not reached, and in an increase of power as an arbiter of affairs in North China generally. The gain of France and Germany is rather to be reckoned as one of prestige, consisting largely in a recognition of their claims to spheres of influence in the Yang-tse valley as being on a par with that of Great Britain. As a consequence, Great Britain's allowance of their claims amounts to a dropping of her assertion of paramountcy in the region. The loss to Japan is principally an undetermining of its influence in North China, Manchuria, and Corea in favor of Russia, rendering it less probable that Corea will ever be under Japanese control. The loss to the United States, which is rather conditional than actual, consists in the menace to the open door contained in Russia's position in the north. As to how far China is sincere in its promises of reform it is too early to say. As to how far the imperial government can enforce the reform edicts if it tries seems to be a matter of great difference of opinion. Some observers profess to view the situation with complacency and express in the most optimistic terms their belief that there will never be a recurrence of the evil days of 1900. Others go just as far in the opposite direction and prophesy a widespread international war and the total dismemberment of the empire within five years. An American writer in the *Forum*, Mr. Mark H. Dunnell, formerly deputy United States consul-general at Shanghai, well summarizes the situation after the settlement as follows:

"The root of the difficulty in our relations with China lies in the fact that we impose upon her by force the obligations of a sovereign state in the family of nations, and at the same time withhold from her the rights of such a state. The western Powers say to China: You must allow our people to live among you; you must allow our merchants to trade and our missionaries to proselytize; you must allow us to navigate your inland waters and participate in your coasting trade, although we ourselves do not accord such privileges to the foreigner; you must allow us to send you opium, although you declare that it is injurious to the health and morals of your people, and that you could stamp out domestic production if importation were stopped; you must allow us to fix the amount of customs tariff we shall pay on your imports from us, although we ourselves regard the right of taxation as the most sacred of sovereign rights; you must allow our missionaries to reside in the interior of your country, but you must not exercise any authority over them, although their residence is so remote that our own officials cannot control them; you shall not enjoy the full reciprocity which obtains between Christian states in the exercise of jurisdiction over the subjects or citizens of each other in their respective territories, for your laws are barbarous, your judges ignorant and corrupt, and your prisons loathsome; we will not admit you into the family of nations on terms of equality, but we will, nevertheless, compel you to act as if you were so admitted; you must discharge the obligations of civilized intercourse, however ignorant you may be of them; in short, you shall bear the burdens of civilization, but you shall not enjoy its privileges."

CHOLERA. See VITAL STATISTICS.

CHRISTIAN AND MISSIONARY ALLIANCE. The report of the society for 1900-01 indicates notable financial prosperity, the receipts for the year, including amounts handled both by the treasurer and through special departments, aggregating \$265,000, an increase of 70 per cent. over the preceding year. Of this sum \$100,000 was devoted to the relief of famine sufferers in India. The alliance carries on an active home missionary work, the United States being organized into districts, and maintains foreign stations in India, China, Japan, the Philippine Islands, Africa, Palestine and Arabia, the West Indies, and in several South American states. During the year 1901 meetings were held in various places, the annual convention at the Gospel Tabernacle, New York, October 4-14, being marked by an enthusiastic attendance of workers from many parts of the world. President, Rev. A. B. Simpson; secretary, Rev. A. E. Funk; headquarters, 690 Eighth Avenue, New York City.

CHRISTIAN CATHOLICS (DOWIE). The adherents of John Alexander Dowie, the apostle of "divine healing," constitute a comparatively recent sect which makes its headquarters in Chicago, where there are now 10 "tabernacles of Zion." The Christian Catholics observe strictly the dictates of religion and morality, and are advocates of divine healing through the efficacy of prayer, a tenet which distinguishes them from the followers of Christian Science, though both sects dispense with medical aid. The most notable event of 1901 occurred on June 2, when, before a great assembly in the Chicago Auditorium, the apostle announced himself as Elijah returned to the earth, this being the third appearance of the prophet, who has come as Elijah, as John the Baptist, and as John Alexander Dowie—a claim which subsequently was accepted by a large gathering of the priesthood of the church. The death in Chicago of a woman under treatment by "divine healing" evoked widespread protest against the sect; early in July some twenty disciples of Dowie were roughly handled at Evanston, Ill., where they were attempting to hold a meeting; and toward the close of the year "Dr." Dowie became the defendant in a suit arising from an alleged repudiation of a business promise in connection with the "Zion" lace industry. The sect declines to issue statistics as to its numbers, but it is believed that there was during 1901 a substantial increase over the estimated 40,000 of 1900.

CHRISTIAN ENDEAVOR, UNITED SOCIETY OF, an interdenominational and international order, founded in 1881, at Portland, Me., to serve as a training school for the duties of church membership. The society now has 61,427 societies and adherents approximating 4,000,000; there are over 16,000 Junior societies, with 483,000 members, and 1,285 Intermediate societies, with 38,500 members—statistics which indicate an addition of some 2,000 new societies and 100,000 members during 1901. In the United States there are 43,272 societies, including 1,000,000 members. Christian Endeavor constitutions are now issued in 30 different languages. An international convention, held July 6-10, in Cincinnati, was characterized by a notably large attendance, with delegates present from Japan, China, India, and Australia. A memorial letter to Rev. Francis E. Clark, D.D., the president and founder of the society, signed by eminent persons in various vocations, was a feature of the meeting. The next assembly convenes in 1903. President Rev. Francis E. Clark, D.D.;

treasurer, William Shaw; general secretary, John Willis Baer; headquarters, Tremont Temple, Boston.

CHRISTIANS, a sect of the United States which originated during the early part of the nineteenth century, in a membership derived from several other existing bodies. The two branches, Christian Connection and Christian Church (South), which withdrew at the time of the slavery agitation, but are now in close relation, have 109,278 members, 1,517 churches, and 1,151 ministers. There are over 60 conferences, those of the South being organized of both white and colored members. General meetings of Christians of a representative character have been held at periods of one, three, or four years since 1819, and since 1834 have been of a more thorough organization; the American Christian Convention, in its present form, was established in 1866. The Christians have several educational institutions, including a theological seminary, known as the Christian Biblical Institute (founded in 1868), located at Stamfordville, N. Y., and maintain a publishing house in Dayton, O. *The Herald of Gospel Liberty* and the *Christian Missionary* are representative publications. The denomination pursues organized lines of missionary work—the success of its domestic missions being evidenced in the establishment during 1901 of 6 new churches and 7 Sunday schools, while in the foreign department, which already included Japan, work has been extended to Porto Rico. There are now in these fields 22 workers (9 missionaries), 7 churches, with 348 members, and 16 Sunday schools, with 725 scholars.

CHRISTIAN SCIENTISTS, the followers of Mrs. Mary Baker G. Eddy, who, in 1866, founded the sect which has since attained to an approximate membership of 100,000, though the avowed adherents of the Church of Christ, Scientist, are estimated at several times that number. There were in 1901, 497 churches, 377 of which were in the United States and the remaining 120 in England, Scotland, Canada, France, and Germany; in each church two "readers" conduct the services, a total of 994 throughout the body. The membership of the First Church of Christ, Scientist, in Boston, the "Mother Church," is 22,114, an increase of 3,029 in the past year. Besides the regular branch churches, 53 of which were established during 1901, there are 167 places (158 in this country) where services are held. Twenty-eight of these societies were established in 1901. *The Christian Science Journal* (monthly) and *The Christian Science Sentinel* (weekly) are published under the auspices of the church. The annual letter of Mrs. Eddy, read June 23, 1901, in the Christian Science Temple, Boston, is devoted to the exposition of the tenets of Christian Science concerning God and evil, and to a specific defense against critics. During the year there were controversies, such as have been frequent in the past, over the refusal of Christian Science adherents to receive medical aid in cases of illness which have terminated fatally, the arguments of both opponents and adherents of the doctrines of Christian Science being vigorously presented. In some instances in New York City, neglect of probably curative measures was charged at inquests held by coroners upon people who had died without medical attendance. Similar cases met with similar condemnation at the hands of coroners' juries in Ontario and British Columbia in February, 1901. In Georgia the Superior Court denied the application for a charter by an institute of Christian Science, and rendered a decision that the Scientists cannot practice treatment of diseases without having regularly graduated in medicine and been licensed by the examining board of the State. In New York State a bill was introduced in the Assembly in January, 1901, designed to prevent the treatment of disease by Christian Scientists, but was so drawn as to allow loopholes of escape, in its definition of the practice of medicine, for illegal practitioners of the profession. This bill was known as the Bell bill, or No. 167, and aimed to amend section 151 of chapter 661 of the laws of 1893. After amendment the bill finally died in committee. A substitute bill, No. 1779, failed to meet the wishes of representatives of the medical associations and the opticians, and suffered a similar fate.

CHRISTIAN SCIENTISTS (REFORMED). See REFORM CHRISTIAN SCIENCE CHURCH ASSOCIATION.

CHRISTMAS ISLAND, situated in the Indian Ocean, 220 miles south of the western end of Java, is a British possession, having been placed under the government of the Straits Settlements in January, 1889. In the spring of 1901, Sir John Murray, the eminent British geographer and scientist, returned from a six months' expedition to the island, which he was the first to cross from end to end. The island is about 12 miles long and 7 broad, and contains about 50 square miles of dense forest. Murray found there 13 whites, "including a doctor, chemist, and engineer," and 720 coolies, who were engaged in working the phosphate deposits. It is believed that before the British annexation no human being lived on the island. The fauna of the island is of great interest. There are large numbers of red crabs, as much as 18 inches in diameter, toothless snakes and blind snakes, and two species of rats not known elsewhere. Besides the rats there are only three species of mam-

mal. The island has a central plateau, 1,000 feet in height. The sea depth off shore is three to four miles. In the spring of 1901 the government at Singapore dispatched to Christmas Island a resident magistrate, an official of the department of public works, a scientific commission, and a force of police—35 in all. Administration buildings will be erected. The phosphate beds are of considerable importance; "pits have been dug through the phosphate deposits to a depth of 40 feet, and yet the bottom has not been reached, so that the quantity is enormous, and on one hill alone is placed 12,000,000 tons." The estimated output in 1900 was 37,000 tons, and it was thought that the quantity shipped in 1901 would amount to 175,000 tons.

CHROMIC IRON ORE. Practically no chromic iron ore was produced in the United States in 1900, for under present conditions it is not possible to mine the domestic ores at a profit; in fact, the production in this country virtually ceased in 1896. Turkey still remains the chief foreign source of chrome, though the chrome ore from Newfoundland is beginning to gain a foothold in the United States. The imports to the United States in 1900 were:

Chromate and bichromate of potash, 111,761 pounds.....	\$7,758
Chromic acid, 35,452 pounds.....	7,232
Chrome ore, 17,542 long tons.....	305,001
	<hr/> \$319,991

CHURCHILL, WINSTON, American historical novelist, produced his greatest success, *The Crisis*, in 1901. He was born in St. Louis, November 10, 1871, and was educated at the United States Naval Academy, where he graduated in 1894. He engaged at once in literary work and published his first novel, *The Celebrity*, in 1898, which was followed in 1899, by *Richard Carvel*, a novel of Revolutionary times, that had a large sale. *The Crisis*, which is a study of the American Civil War, in particular, as it affected the country about St. Louis, like *Richard Carvel*, sprang at once into great popularity; it was generally regarded as a careful, unprejudiced story of the conflict over the slavery question.

CINCINNATI, SOCIETY OF THE, founded 1783 by the American and French officers at the cantonments of the Continental Army on the Hudson at the close of the Revolutionary War, with the object of perpetuating the remembrance of the struggle and the mutual friendship formed during its continuance. Thirteen State societies were formed, and one in France; membership in the society descends to the eldest lineal male descendant, and under proper restrictions, to the descendants of female relations of members. By the death of the president-general, Hon. William Wayne, of Pennsylvania, in November, 1901, the presidency is vacant; secretary-general, Hon. Asa Bird Gardiner, of the Rhode Island Society. The office of the secretary-general is at Garden City, N. Y.

CIVIL SERVICE REFORM. The annual report of the Civil Service Commission presents evidence to show the considerable progress of the merit system in the public service. The total salaries of positions in the classified service, appointment to which is made as the result of competition, amounts to \$75,000,000 per annum, while salaries of all unclassified positions in the executive branch of the public service slightly exceeding 100,000 in number, do not exceed \$30,000,000; 60 per cent. of this amount is for the compensation of 4,429 presidential postmasters and 72,165 postmasters of fourth class post offices. During 1901, 46,763 persons were examined, of whom 35,000 passed. Of the number who passed, 34,473 were for original appointments to the service, and of these 9,889 were appointed, the largest number ever appointed to the classified service. A constantly increasing number of persons are being appointed to the government service as a result of competitive examinations and a very small number of those appointed have been removed. Over 98 per cent. of the appointees after competitive examination have received absolute appointments at the end of their probationary term of service.

President Roosevelt's first message contained the following passage relating to the extension of the merit system to our island dependencies: "It is important to have this system obtain at home, but it is even more important to have it applied rigidly in our insular possessions. Not an office should be filled in the Philippines or Porto Rico, with any regard to the man's partisan affiliations or services, with any regard to the political, social, or personal influence which he may have at his command; in short, heed should be paid to absolutely nothing save the man's own character and the needs of the service." The administration of the civil service in

the Philippines, according to a recent report made to the National Civil Service Reform League, has been in full accord with the spirit of this declaration. In September, 1900, the Philippine Commission passed "An act for the establishment and maintenance of an efficient and honest civil service in the Philippine Islands." The purpose of this act was to establish a system of appointments through competitive examination. A set of civil-service rules was adopted in November, 1900, which gave to the Civil Service Board unusually large powers. The system is under the direction of the United States Civil Service Commission. Competitive examinations have been held in the United States for the following Philippine positions: Stenographers, typewriters, translators of Spanish, inspectors of boilers, and department assistants. Out of a total number of competitors of 436, 166 passed, of whom 127 became eligible for department assistants. Of the eligibles obtained, 29 had been offered positions up to December 12, 1901, and 22 had accepted. It was stated that a large number of additional appointments would be made as soon as the eligible list reached the islands. Prior to the establishment of separate registers for the Philippine service, 21 appointments were made from the eligible lists of the United States Commission, and 23 persons were transferred to the classified service.

The Civil Service Commission remarks of the Philippine Civil Service Act as follows: "The two features of the Philippine Civil Service Act, which distinguished it most conspicuously from the federal law are (1) its broad scope, embracing not only the offices of the general or central government, but also those in the executive branch of the provincial and municipal governments, and ultimately including every officer and employee from the heads of departments down to the unskilled laborers; and (2) its provisions requiring promotions to be made upon competitive examinations from the lower to the higher ranks, including all positions except the heads of departments and private secretaries of members of the Philippine Commission, and in the case of heads of departments providing that they shall be selected by promotion from a class to be composed of the first, second, and third assistants to the heads of departments."

The National Civil Service Reform League held its twenty-first annual meeting at Boston, December 12 and 13, 1901. The secretary for the committee on legislation stated that several bills relating to the organization of the civil service were before Congress, and that action on some of these might in future be recommended. Among these were: (1) A bill extending the preference in competitive appointments to disabled veterans over civilians, and to all veterans of the Civil War without reference to personal necessities resulting from disability; (2) the bills to reorganize the consular service, introduced at the last session by Senator Lodge and Representative Adams; (3) the various bills providing for the retirement of superannuated employees. The resolutions adopted by the League congratulated the country on the restoration to the classified service of 1,600 positions in the War Department, on the amendments to the Civil Service rules, improving the character of the Indian service, placing rural delivery post-offices in the classified list, and requiring officers of the government to attend and give testimony upon investigations held by the Civil Service Commission, preventing the abuse of collusive transfers, and prohibiting the payment of salaries to persons illegally appointed; on the removal or refusal to appoint officials who have violated the civil service law; on the excellent character of the President's first appointment to the Civil Service Commission; and on the result of the election in New York City. The recommendations of the League are as follows:

"That the appointments to the entire labor service of the United States be regulated by rules as to registration similar to those which have been found so successful in the War and Navy departments; to the extension of the competitive system to appointments in the municipal service of the District of Columbia; the application to the Consular Service of competitive methods for the ascertaining of the fitness of candidates for appointment, similar to those now prevailing under the Civil Service Commission; the continued enforcement and development of the admirable Civil Service principles which have been laid down for the organization of the public service in our insular possessions. It urges the opposition of the plan to include the temporary appointees of the Census Office in the classified service and the enactment of any legislation similar to the Veterans' Preference Bill, defeated at the last session of Congress. The Investigating Committee of the league reported the following violations of the Civil Service Law to the President within the past year: (1) On the abuses in the Indian service—no actions as yet taken; (2) on the violations of the law by Postmaster Hicks, of Philadelphia—the offender was not reappointed; (3) on the assignment of government laborers to clerical duties—abuse remedied in the War Department; (4) on alleged violations of the civil service law by the collector of internal revenue at Louisville, Ky., by the collector of customs at El Paso, Tex., and by the postmaster at Jersey City, the first two officials being removed and the third having voluntarily resigned; (5) on the census frauds in the southern counties of Maryland—J. H. Cling being subsequently sentenced to two

years' imprisonment for instigating them; (6) on abuses in the selection of subordinates of the House of Representatives—no action; (7) on constructive exemptions of federal officers from classification—action taken in the matter of rural free delivery, and President's message recommends the selection of special or temporary appointees from the classified list. The report of the committee on civil service in dependencies has already been mentioned. The committee on superannuation in the civil service recommended that those hereafter appointed to positions in the civil service be required 'to file with the government a deferred annuity policy, issued by reputable insurance companies and guaranteeing to the policy-holder, at a suitable age, the payment of a stipulated annual sum during the remainder of his life.' Of the State associations, Mr. R. Francis Wood, of Pennsylvania, reported that the civil service law in Philadelphia was defective in not providing proper machinery for carrying out its provisions, and that the whole system as carried out was 'nearly valueless'; Mr. George McAneny, for the New York Association, reported wholesale and widespread violations of the civil service law by the Tammany officials, extending over a period of 15 months prior to the fall election of 1901; and Colonel John W. Ela for the Chicago Association, reported that the successful battle for the enforcement of the civil service law passed in 1895, which at one time seemed well-nigh hopeless was 'the result of a quick, sharp campaign by the citizens' association; and now the County Civil Service Commission is composed of men of character and intelligence, who are actually holding *bona fide* examinations, intended to disclose the merit of the applicants, rather than the cunning of the examiners, and are otherwise giving promise of the future enforcement of the County Act."

CLARKE, THOMAS CURTIS, American engineer and bridge builder, died in New York City, June 15, 1901. He was born at Newton, Mass., September 16, 1827, and was educated in Boston schools and at Harvard University, from which he graduated in 1848. As a member of the Union Bridge Company of New York City, Mr. Clarke built a number of bridges in different parts of the world, including the Hawkesbury bridge in New South Wales, with foundations extending 185 feet below high water, and the Poughkeepsie bridge across the Hudson, with foundations 135 feet deep. He was one of the first to use concrete in large masses in the foundations and piers of bridges. He was president of the American Society of Civil Engineers in 1896, and was made member of the Institute of Civil Engineers of London in 1874.

CLARK UNIVERSITY, Worcester, Mass., opened in 1889. President, G. Stanley Hall, Ph.D. The institution in 1901 was open to graduates of other colleges only; it has aimed to supplement the work of other institutions by giving graduate work of an advanced and highly specialized nature along the lines of mathematics, physics, biology, psychology, and education. Beginning with the academic year 1902-03 the university will have a collegiate department. This has been organized to comply with the terms of the will of the late Jonas Clark, who gave \$2,500,000 to the university on the condition that a collegiate department be organized. As announced, this new school is to be a rather radical departure from any existing college, in that there are to be no entrance requirements and no specified course of study. The library contains about 20,000 bound volumes and 1,500 pamphlets. Of the bound volumes, about 3,500 are Congressional publications. The contents of the library refer chiefly to the five organized departments. The American Antiquarian Society Library and the Worcester Public Library, 100,000 volumes each, are freely accessible to students, and the facilities of the latter institution for borrowing from distant libraries are also available. There is, in addition, a system of exchange between Clark University and Harvard University. A summer school of two weeks was held in 1901, and a special Saturday class was provided for teachers. The publications connected with the university are *The American Journal of Psychology*, *The Pedagogical Seminary*, and *The Mathematical Review*. In 1900-01 the instructing and student body of the institution consisted of the president, 3 professors, 4 assistant professors, 3 docents, 24 fellows and assistants, 8 scholars, and 15 students in the Saturday class. See **PSYCHOLOGY, EXPERIMENTAL**.

CLAY. The output of clay products in the United States in 1900 was very large, but as far as brick and tile were concerned, it was somewhat lower than in 1899. Pottery, on the other hand, showed a substantial increase. The output of clay products for the two years was as follows:

Materials.	1899.	1900.
Common brick	\$39,887,522	\$38,621,514
Front brick	4,767,343	3,864,670
Paving brick	4,750,424	4,764,124
Fancy brick	476,191	289,698
Enameled brick	329,969	323,630
	\$50,211,449	\$47,863,636

The production of raw clay mined in 1900 amounted to 1,221,660 short tons, valued at \$221,507. The imports of raw clay in 1900 amounted to 144,107 long tons, valued at \$62,367, while the value of the imported earthenware, chimney brick, and tile was \$8,912,046. The value of the exported wares was \$1,281,831. The following reports were issued during 1901: *The Clays and Clay Industries of Wisconsin*, by E. R. Buckley (Wisconsin Geological and Natural History Survey, Bulletin No. 7, part 1); *The Clays of New York*, by H. Ries, Bulletin New York State Museum, Vol. 7, No. 35.

COAL. The United States now ranks easily first among the coal-producing nations, as its output which, for the first time in 1899, exceeded that of Great Britain, was even greater in 1900. The production of coal in the United States in that year was 269,444,859 short tons, valued at \$306,891,364, as against 253,739,992 short tons valued at \$256,077,434 in 1899. This is an increase of 6 per cent. in tonnage and of 16 per cent. in value. There was also an increase in the exports, but these amounted to but 4 per cent. of the total. The production of the different coal fields in the various States in 1900 was as follows:

Bituminous (including lignite, bituminous coal, and scattering lots of anthracite):

Virginia		Kansas	4,467,870
North Carolina..}	57,912	Arkansas	1,447,945
<i>Appalachian Field.</i>		Indian Territory.	1,922,298
Pennsylvania ...	79,842,326	Texas	968,373— 17,549,528
Ohio	18,988,150	<i>Rocky Mountain Field.</i>	
Maryland	4,024,688	North Dakota ..	129,883
Virginia	2,353,576	Montana	1,661,775
West Virginia...	22,647,207	Wyoming	4,614,602
East. Kentucky..	2,222,867	Utah	1,147,027
Tennessee	3,708,562	Colorado	5,182,176
Georgia	315,557	New Mexico.....	1,263,083
Alabama	8,394,275—142,497,208	Idaho	10
<i>Northern Field.</i>		Nevada	0— 13,398,556
Michigan	894,475	<i>Pacific Field.</i>	
<i>Central Field.</i>		Washington	2,474,093
Indiana	6,484,086	Oregon	58,864
West. Kentucky..	3,106,097	California	171,708— 2,704,665
Illinois	25,767,981— 35,358,164		
<i>Western Field.</i>			
Iowa	5,202,939		
Missouri	3,540,103		
			269,881,827

Of all the States, Arkansas showed the greatest percentage of increase, namely, 75 per cent., while in West Virginia there was an increase in value of 52.8 per cent., and in tonnage of 17.6 per cent. According to the *Engineering and Mining Journal*, the production of 1901 will probably exceed that of 1900 by 30 million tons, and it would no doubt have been still greater had there not been a great scarcity of cars for carrying the coal from the mines to the market. The production of anthracite in 1901 will probably exceed that of 1900 by eight million tons, although anthracite is now almost entirely a domestic fuel. This great increase in the production of coal in 1901 is largely due to exceptional prosperity and the absence of labor troubles. The value of the imports in 1900 amounted to \$1,113 for anthracite and \$5,006,881 for bituminous coal. The value of the exports was \$7,107,412 for anthracite and \$14,416,667 for bituminous coal. Up to December 31, 1901, the imports of bituminous coal amounted to 1,919,962 long tons, valued at \$5,291,429, while the exports for the same period were 5,390,086 tons of bituminous and 1,993,307 tons of anthracite.

There was considerable increase in the coal production of Alabama in 1901, due to the opening up of new mines, and among the western coals the Arkansas bituminous coal has attracted much attention on account of its smokeless character. Considerable quantities of it are shipped to the St. Louis market. There has also been great activity in the coal fields of Indian Territory, although the production of oil at Beaumont, Texas, has threatened to interfere somewhat with the coal from this region. Mention should be made of the recent development of the extensive beds of coking coal found at Baroteran in Northern Mexico, which an American company has developed, and their product will no doubt seriously interfere with the exportation of coal and coke from the United States and New Mexico. Lignite is said to exist in the Philippines, in Luzon, Botan, Mindoro, Masbata, Negros, Cebu, Mindanao, and other islands. Large fields are said to occur near Bulacacao. Among the recent publications dealing with coal may be mentioned the following: T. W. Vaughan, *Reconnaissance in the Rio Grande Coal Fields of Texas* (Bulletin 164, U. S. Geol. Survey); E. Ludlow, *The Coal-Fields of Las Esperanzas, Coahuila, Mexico*; N. R. Drake, *The Coal of Northeastern China* (Trans. Amer. Inst. Min. Eng., February meeting, 1901); *Notes on Scotch Coal-Fields* (Iron and Coal Trades Review, October 4, 1901); F. E. Saward, *The Growth of American Coal Exports* (Engineering Magazine, xxii, p. 321, 1901).

Rank of coal-producing States in 1900, with amount and value of product and percentage of each:

	Short Tons.	P.C.			P.C.
1 Pennsylvania:			1 Pennsylvania:		
Anthracite . . .	57,367,915	21.3	Anthracite ..	\$85,757,851	27.9

COBALT. See NICKEL.

COCAINE HABIT. The most insidious of all drug habits, cocaineism, is becoming more prevalent. It is readily acquired by those who have used the drug in diseases of the nose or throat or for carious teeth, as well as by those who take it as a substitute for opium or alcohol. During the exhilaration that follows its administration, the victim usually can do intellectual work with little fatigue; but the ability for concentration and application becomes weakened, and very soon habits of procrastination are formed. Insomnia, constipation, rapid emaciation, pallor, tremor, and neurasthenia result in all cases, and in the worst examples hallucination of hearing and mental and moral failure supervene. Some patients consume as much as sixty grains of cocaine a day. Immediate withdrawal, with rest in bed, strychnine, and hypnotics constitute the treatment. Several States passed laws in 1900 controlling the sale of cocaine, and in 1901 Virginia took a similar step, after the disclosure of the fact that there were 500 cocaine victims in Roanoke. The habit has become so prevalent in Bengal that efforts are being made to restrict the sale of the drug, which the Hindus use as a substitute for opium. Marfan, of France, in 1901, reported a case of a father who had been a cocaineomaniac for eight years, to whom were born two idiot children.

COCHIN-CHINA, a name formerly applied to a greater part of the Indo-Chinese peninsula, but now generally restricted to the southernmost division of the French colony of Indo-China. The area is estimated at 23,160 square miles, and the population (1899) at 2,323,499. The country is directly administered by French officials under the supervision and control of a lieutenant-governor. It is divided into 21 provinces and 2 municipalities (Saigon, the capital, population 50,000, and Cholou), and is represented in the French parliament by a deputy. In the local budget for 1901, revenue and expenditure balanced at 4,439,500 piastres, and the contribution of France in the budget of 1901 was 320,112 francs. The chief product is rice, of which 608,998 tons were exported in 1900, mostly to China, the Philippine Islands, and Europe. Cotton, silk, hides, fish, and pepper are also exported. The combined imports of Cochin-China and Cambodia, most of whose foreign trade passes through Cochin-China, amounted in 1900 to 66,200,000 francs, and the total exports 111,000,000 francs. The franc is worth 19.3 cents. There is a railroad in operation, 51 miles long, from Saigon to Mytho, and lines are being constructed from Saigon to Tam-Linh and from Tam-Linh to Dji-Ring. See INDO-CHINA.

COCHIN-CHINA DIARRHŒA. This is a disease consisting of severe gastro-intestinal disturbance with an intermittent diarrhœa, accompanied by grave interference with digestion and assimilation of food. It is caused by the presence in the intestines of a small nematode known as *Strongyloides intestinalis*, measuring from 1 to 1.4 micromillimetres in length and from .05 to .075 micromillimetres in breadth. It was first described by Normand in 1876, who found it in the evacuations of French soldiers suffering from Cochin-China diarrhœa. Beavy gave the name *Anguillula stercoralis* to the same parasite. It has been frequently seen in France, Germany, Italy, and Austria. In 1896 the first case of the disease in North America was seen in the person of a Bavarian peasant who immigrated to Baltimore, Md. His case was reported by Strong, who is now director of the U. S. Army Pathological Laboratory at Manila, P. I., and who has seen four cases of infection with this worm at Manila. The parasites, adult and embryonic, together with their eggs, have been found in the glands of Lieberkühn of the intestines, where their presence causes atrophy of the epithelium and infiltration of round cells. The disease is fatal in a few cases. Increased communication between the United States and its tropical territory will probably result in the occurrence of Cochin-China diarrhœa in our seaport towns. Consult Strong, in *Johns Hopkins Hospital Reports*, Vol. X., Nos. 1 and 2, 1901.

COFFEE. The world's crop for the year ending June 30, 1901, is estimated at 14,475,000 bags (of 132.28 pounds), of which Brazil produced 10,027,000 bags, as against 3,548,000 bags in all other countries. According to the *United States Crop Reporter*, "the Brazilian crop, i. e., the one the marketing of which will have been completed by July 1, 1902, is evidently a record crop and is estimated commercially as high as the seemingly extravagant figures of 15,000,000 bags, or about 1,984,000,000 pounds." The production of coffee in Brazil has doubled within a decade and has equaled twice and surpassed once within the past five years the amount that a few years ago constituted the entire world's crop. The imports of coffee into the United States during the calendar year 1901 exceeded all previous records, amounting to 1,072,009,182 pounds, valued at \$70,156,044, as against 785,918,534, valued at \$59,510,771 in 1900. Of the 1901 imports, 951,438,252 pounds were from South America. There are increasing evidences that production is exceeding demand, and there are at present unprecedented supplies in the leading markets.

The exports of coffee from the Territory of Hawaii during the year ending June

30, 1901, amounted to upwards of 2,600,000 pounds, valued at \$311,000. The production of 1901 was greater than that for any preceding year in spite of unprecedentedly low prices. The downward trend of the prices of all grades of coffee since 1895 has brought ruin to hundreds of small planters in Hawaii. Only those continue in the industry who have sufficient capital to tide over years of depression, or who are content to market their product at or below the bare cost of production. In most of the coffee districts the owners of the larger tracts of bearing coffee have ceased to cultivate their plantations and are spending no money on the harvesting of the crop, allowing the berries to go to waste unless they are able to get Japanese or Portuguese laborers to harvest the crop on shares ranging from one-half to four-fifths of the yield. In Porto Rico the coffee plantations have to a considerable extent recovered from the effects of the hurricane of August, 1899, and the crop for 1901 reached nearly its normal amount, but was marketed at very low prices. In the years preceding 1898 the island found a market in France, Spain, Italy, and other European countries for the greater part of its coffee, at prices ranging from 20 to 35 cents a pound. During 1901 the price received averaged about 12 cents.

As the result of a study on the effects of shade in coffee culture, O. F. Cook, of the United States Department of Agriculture, maintains that shade is not generally necessary, even when coffee is grown at low elevations. "The beneficial effects connected with shade arise from the protection afforded against drouth, erosion, and winds. The planting of shade trees for these purposes is accordingly determined by local conditions of climate and soil, and furnishes no reason for the general planting of shade trees. In regions not affected by injurious climatic extremes the planting of shade trees is justified from the cultural standpoint only by the increased fertility imparted to the soil by means of the nitrogen-fixing root tubercles of leguminous species. This view has not been made the subject of experimental demonstration, but it seems to accord with all the facts thus far ascertained." The newly established agricultural experiment station in Porto Rico has undertaken the investigation of this and other problems connected with coffee culture.

COINS, VALUE OF FOREIGN. The coins and coinage of the United States will be found in the article *United States* (paragraph Coinage). The production of gold and silver will be found under the articles *Gold* and *Silver*. Under the article *Money* will be found the world's stock of gold, silver, and uncovered paper. The following tables show the official valuation of foreign coins by the United States Treasury; first, in the case of countries with fluctuating currencies; and, second, in the case of countries with fixed currencies, giving their semi-annual variations during the year 1900 and their quarterly valuations in 1901.

A.—Countries with Fluctuating Currencies.

COKE. The production of coke in 1900 was 20,533,348 short tons, valued at \$47,443,331. This value was more than double that of 1897. The product in 1900 came from 22 States and Territories, and was produced by 388 establishments from 32,113,543 short tons of coal, the latter thus yielding 63.9 per cent. of coke. The average value of the coke per ton was \$2.31, although in the early part of the year exceptionally high figures were reached in some districts, such as that of Connells-ville, where furnace coke sold for \$4.00 to \$4.25, and foundry coke from \$4.25 to \$4.50 per ton. These prices had dropped in the summer to nearly one-half, but rallied later. The new coke area of Fayette County, Pennsylvania, promises to become one of the most important districts in the State. At the close of 1900 there were 8,817 more coke ovens in operation than in 1899, while 5,804 additional ones were in the course of construction. The use of by-product coke ovens, which was introduced

into the United States by the Solvay Process Company in 1891, is rapidly spreading, so that at the end of 1900 there were 1,085 of these ovens in use and 1,096 more building. Some of these by-product plants are very large, one at Everett, Mass., having 400 ovens, to which 800 were to be added; another of similar size is located at Sydney, Cape Breton, and a 280-oven plant at Johnstown, Pennsylvania. They are proving very successful, as a ready sale is found for the by-products. According to the United States Geological Survey, *Mineral Resources of the United States*, 1900, by products are tar, ammonia liquor, and ammonium sulphate. The ammonia is obtained as a weak liquid, containing ammonium sulphate and ammonium carbonate. It is concentrated to a crude impure liquid with 20-25 per cent. ammonia and 40-45 grammes per liter of hydrogen sulphide, and 100-120 gr. per liter of carbon dioxide. This is sometimes sold as ammonia liquor or worked up into ammonium chloride, ammonium carbonate, ammonium sulphate, or ammonium hydrate. Cyanogen has recently been discovered to be a constituent of these by-product gases, and can be removed by treatment with an alkaline salt. The cyanogen is converted into a ferrocyanide of potash or soda and separated by crystallization, after which it may be refined. The amount of cyanogen obtained varies with the volatile matter of coal, the percentage of nitrogen in the gas and the temperature of the ovens.

COLOMBIA, a republic of South America, occupies the northwestern part of the continent between the Caribbean and the Pacific. The capital is Bogotá.

Area and Population.—The aggregate area of the 9 departments comprising Colombia has been estimated at 513,938 square miles; it is not unlikely that this estimate is too large. There are boundary disputes with Brazil, Ecuador, and Peru. The boundary dispute with Costa Rica was settled on September 12, 1900, through the arbitration of the president of the French republic; the decision was less satisfactory to Costa Rica than to Colombia. The estimated population is somewhat over 4,000,000.

Government.—The chief executive is a president, who is elected for a term of six years and is assisted by a responsible ministry. The legislative power devolves upon a congress of two houses, the Senate and the House of Representatives. The president elected for the term beginning August 7, 1898, was Señor M. A. San Clemente, a Conservative; by the *coup d'état* of July 31, 1900. He was superseded by the vice-president, Señor José Manuel Marroquín. By the constitution of August 4, 1886, which was adopted through the influence of the Conservatives, the federal power was strengthened, the several States losing their sovereignty and the governors becoming appointees of the president. The strength of the regular army is determined at each session of Congress, but in case of war the president may raise such forces as are necessary. There is practically no navy.

Finance.—The monetary standard is silver and the unit of value the peso, worth in United States money 45.1 cents on October 1, 1900, and 42.8 cents on October 1, 1901. There is a large paper circulation, the paper peso in 1900 being worth about 28 cents. The chief source of revenue is customs. The estimated revenue and expenditure for the biennial period were 34,361,000 pesos and 35,771,013 pesos respectively; for the period 1899-1900 the estimates balanced at 29,918,640 pesos. The external debt in the middle of 1900 was reported at £2,747,250 (\$13,369,492); the internal debt in 1899 amounted to 11,359,074 pesos.

Industries and Commerce.—Mining and agriculture are the principal industries. The soil of Colombia is fertile, but only a small portion of it is under cultivation. The most valuable mineral exploitation at present is that of gold, silver, and emeralds. The principal crop is coffee; others of importance are sugar, cacao, and tobacco. The raising of live-stock is important. The leading imports include food-stuffs and liquors, cotton textiles, and iron and steel goods. The total imports and exports in gold pesos (worth approximately one dollar in United States money) were valued in 1897 at 18,136,598 and 16,820,411 respectively; in 1898, 11,346,028 and 19,735,733 respectively. The export trade has been chiefly with Great Britain, the United States, France, Germany, and Venezuela, named in order of importance. The transit trade between the free ports, Panama and Colon, is not included in Colombia's commerce. The coffee export in 1898 amounted to 39,100,102 kilogrammes. The export of rubber from Colombia between 1855 and the middle of 1900 has been reported at 94,624,743 pounds. The greatest quantity shipped in any five-year period was in 1871-75, amounting to 26,859,618 pounds. From that time the export has declined to 4,299,837 pounds in 1896-1900. The greatly reduced production is due in part to the practice of felling rather than tapping trees. In the fall of 1901 com-

mercial depression—induced by two years of civil war—seemed to have reached the lowest possible limit. Through the scarcity of labor the greater part of the coffee crop was not gathered, and through lack of transportation large quantities of the last and previous crops remained on the plantations or at the river ports. The same distress prevailed with regard to hides and other important products, and there seemed to be no indications of early relief.

Communications.—Roads are few and in wretched condition, and usually traffic is carried on as far as possible by river navigation. The Magdalena and its tributaries afford about 1,000 miles of navigable water. In 1901 the reported length of railways in operation was 648 kilometres (402 miles); a number of lines were projected and some under construction. The Panama railway, 48 miles in length, is owned by an American corporation, with headquarters in New York. The total earnings of this line for 1900 were \$2,655,196, an increase of \$460,152 over 1899; the net gain in income over that year, however, was \$151,532. In 1900 westbound freight amounted to 153,758 tons and eastbound freight 203,619 tons, while the passengers going east and west respectively were 41,576 and 41,656.

HISTORY.

Civil War and the Trouble with Venezuela.—During the year 1901 the revolt against the Conservative government in Colombia took on an international aspect from the alliance of the Liberal insurgents in that country with the Castro government in Venezuela. War between the de facto governments of the two countries seemed inevitable, but down to the end of the year, peace had officially at least been maintained. Late in December, 1900, the principal leader of the revolutionists, General Uribe-Uribe, fled from the country and visited the United States. During his absence the insurrection seemed to have almost died out, the rebels holding only the province of Tolima, south of Bogotá. In June it was reported that at a meeting in New York, an agreement had been reached between General Uribe-Uribe and Dr. Silva, the Colombian secretary of state, by which the principal demands of the Liberals were to be conceded, and General Uribe-Uribe was to urge his companions to disband. The actual terms of the agreement were never made public, and it is doubtful if there was any attention paid to them by either party in Colombia. In fact, it seemed unlikely that General Uribe-Uribe himself, although he asserts that he is not a revolutionist but a political reformer, would have been satisfied with anything short of the complete overthrow of the existing Colombian government. It was at this point, in the midsummer, before time enough had elapsed to prove whether the New York agreement was indeed a settlement, that the struggle assumed an international character. To understand how this came about it must be kept in mind that the unrest and civil war that has prevailed for some time in the northern countries of South America is not so much a conflict between nations as a struggle of parties; as one writer has put it, a revolt of "the genius of free institutions against the spirit of despotism." The dominant parties in Ecuador and Venezuela are the Liberals, while the government of Colombia since 1885 has been in the hands of the Conservative or clerical party. Quite naturally the Venezuelans and Ecuadorian Liberals have looked with sympathy on the attempt of Uribe-Uribe and his fellow Liberals in Colombia to overthrow the existing despotism in that country, not only because the principles for which he contends are those upon which their own constitutions rest, but because the existence of a conservative government in a neighboring state aiding and harboring the discontented whom they have driven from power, is an actual menace to the continuation of Liberal government in their own territories. The Clerical-Conservative government of Colombia, on the other hand, is quite as decidedly disposed to favor the opposition elements in Ecuador and Venezuela, and realizes that it will never be secure while there is a Liberal republic on either hand, and another, Nicaragua, on the north. This explains, therefore, the new phase of the war that began in the latter part of July, with the crossing into Venezuela of a force of 6,000 men under General Gailbiros, a former supporter of General Andrade, the Conservative president of Venezuela, whom President Castro expelled from the country in 1899. The Colombian government hastened to disavow any connection with the expedition, which it was said consisted of Venezuelan Conservatives, discontented with the Castro government, and Colombian volunteers in sympathy with them. This expedition, however, and another which followed it in August, reports of which were no doubt purposely colored by Castro served as an excuse for Venezuela's withdrawing the exequaturs of Colombian consuls within her boundaries and massing an armed force of 9,000 men on the frontier. On August 19, Castro was reported to have sent both men and arms to aid Uribe-Uribe, who had returned to the country and assumed command of the insurgent forces, declaring that his agreement made with Silva in New York had not been kept by the Colombian government. The attitude of Venezuela was considered so threatening that the United States took a hand, dispatching war-ships to guard either side of the isthm-

mus of Panama, and following up the action on August 24 by a note to President Castro, offering mediation, and calling his attention to the fact that by a treaty made in 1846 with New Grenada, as Colombia was then called, the United States is pledged to guard not only the neutrality of the Isthmus of Panama, but also the sovereignty of Colombia in that region. During September the situation remained practically unchanged. A number of so-called battles were fought between the government and the Liberal revolutionists on Colombian soil, in most of which the latter were apparently successful, receiving aid not only from Venezuela, but from Ecuador, Nicaragua and Costa Rica, although the governments of these countries continued to assert their neutrality. The month ended with a series of actual engagements between Venezuela and Colombian government troops along the frontier, and General Uribe-Uribe, with an army of Liberals, said to be 12,000 strong, marching toward Panama. During October there was little change, the most important military occurrence being the defeat of an insurgent force under General Marin, which was advancing upon Bogotá. Both Castro and Uribe-Uribe issued statements defining their positions. Castro's declaration, while regretting the present situation, asserted that should war follow, it would be the fault of Colombia because of the expedition of General Gailbiros into Venezuelan territory in September, though this movement has, as above stated, been disclaimed by Colombia. The statement of Uribe-Uribe showed him to be a true political idealist, whose aims did not stop with the reestablishment of free institutions in Colombia, but looked toward a union of the three States of Colombia, Ecuador and Venezuela into a single Liberal republic, similar to that in which they had originally been formed after throwing off the Spanish yoke in the first quarter of the nineteenth century.

Early in November there was a cessation of hostilities along the Venezuelan-Colombian frontier on account of the rains, and the scene of fighting was transferred to Panama. The activity of the Liberals increased, and on November 19 they made an unexpected attack upon Colon, which after a weak defense, capitulated. In pursuance of treaty obligations marines were landed from the United States gunboat *Machias* at Colon and from the battleship *Iowa* at Panama on the Pacific side, and through their efforts traffic was kept open cross the isthmus. On November 28 Colon was recaptured by a Colombian government force under General Alban. During the month a strong movement developed among Colombian Conservatives to call upon Dr. Reyes, then minister to France, and holding the position of "designado" or president-elect, to take the presidency immediately, thus superseding Vice-President Marroquin, who has been acting president since the forced retirement of President San Clemente in 1900. Marroquin, who is an ultra-Conservative, has driven out many of the best men in the party, causing some of them to go even to the extent of espousing the Liberal cause. The more moderate men in the party believe that the accession of Dr. Reyes will be followed by a compromise with the Liberals that will secure peace to the country. By the end of December, however, this change had not been effected, and the relations of the parties and of Colombia and Venezuela remained unchanged.

COLONIES. Colonies and other dependencies are treated under their own titles. Discussion of the policies regarding colonies and similar territory will be found under FRANCE (paragraph Colonial Policy); GERMANY (paragraph Colonies); CUBA; PHILIPPINES; PORTO RICO; and AFRICA.

COLORADO, a western State of the United States, has a land area of 103,645 square miles. The capital is Denver. Colorado was admitted to the Union August 1, 1876. The population in 1900 was 539,700, while in June, 1901, as estimated by the government actuary, it was 554,000. The two largest cities and their populations in 1900 were: Denver, 133,859; and Pueblo, 28,157.

Finances.—The receipts of the treasury for the year ending December 31, 1901, were \$1,515,000; expenditures, \$1,551,000; the balance on hand January 1, 1902, was \$455,000. The amount of the State debt was not changed during the year. The State has \$1,437,000 invested in State securities. The tax rate for the year was 4 mills per \$1.00 and the total value of State property as returned for taxation was \$465,000,000.

Industries.—Although the chief industries of Colorado are mining, stock-raising and agriculture, the census reports of 1900 indicated a steady growth in manufacturing interests since 1870. In that time, the population increased from 39,864 to 538,555, or 1,251 per cent., while the average number of industrial wage-earners advanced from 876 to 24,725 or 2,722.5 per cent., embracing in 1900 4.6 per cent. of the entire population. The amount of actual capital invested in 1900 in mechanical industries, exclusive of capital stock, was \$62,825,472, the gross value of the products, inclusive of material re-used in the process of manufacture, was \$102,830,137, most of which is derived from the products of smelting and refining. The situation of Colorado in the centre of the Rocky Mountain region has favored the growth of its manufactures. Of this region, Denver is the great railroad and distributing

centre. The distance of Colorado from the east and the lack of water communication have favored the local producers of articles whose cost is largely increased by freight charges. Abundant fuel is provided by coal mines, the State ranking seventh in coal production in 1900. Denver is the market of the stock-raising region of the Rocky Mountains, the product of the slaughtering and meat-packing industry of 1900 being valued at \$3,562,357, as against \$2,128,030 in 1890. The smelting and refining of gold, silver, copper and lead ores is the most important industry of the State, the value of the product in 1900 being \$44,625,305. Colorado leads in the production of gold and silver ores, the value of the product of its lead smelters and refineries constituting 23.2 per cent. of the total value of the product of the United States. Iron and steel manufactures are next in importance, the products in 1900 being valued at \$6,108,295. The growth of this industry is due largely to the abundant local supply of coal and iron ore. The making of mining machinery and the construction and repair shop work of steam railroads are large industries with products in 1900 valued respectively at \$3,986,915 and \$3,141,602. The output of coke made possible by coal mining and stimulated by demands of the smelters was valued in 1900 at \$1,726,341. Flour milling and the making of malt liquors with products valued respectively at \$2,042,863 and \$4,528,062 have both been stimulated by the increased production of cereals, the wheat crop of 1900 being more than double that of 1890. Fruit canning and beet sugar manufacture are industries of increasing importance, owing to the extensive irrigation of recent years.

Constitutional Amendments.—Several important amendments to the constitution were directed by the legislature to be submitted to the electorate at the next general election. These were as follows: First, that once in four years the electors of each county might vote to exempt or not to exempt personal property and improvements on land from taxation for county, town, school and road purposes; but land exclusive of improvements and franchises on public ways could not be so exempted. The constitution as it stands prohibits a tax for State purposes of more than six mills on all classes of property; while by the proposed amendment franchises and unimproved land may be taxed up to six mills for State purposes, but personal property and improvements on land cannot be taxed more than four mills. Second, that Denver and other cities of the first and second class be given home rule. Under the present constitution, the police and public works board are now appointed by the governor, and Denver has been clamoring for control over its own affairs. It is claimed, however, by the Denver press that the proposed amendment will delay the desired reformation by submitting the question of Denver home rule to the votes of persons who are not directly interested. Third, that any man or woman over twenty-one years of age, a citizen of the United States and a resident in Colorado for one year, might vote at all elections. The existing provision of the constitution prescribes that any male person over twenty-one years of age may vote in Colorado who has resided in the State for six months, but that the legislature may also extend the suffrage to women. The Colorado legislature has already extended the suffrage to women, so that the proposed amendment will merely act to make the suffrage contingent upon one year's residence in the State instead of, as at present, six months. Fourth, that the legislature may by law limit to eight hours per day the hours of employment of all workers in mines, blast furnaces and smelters, or in other branches of industry deemed dangerous to life or injurious to health. The direct cause of this amendment was a decision by the Supreme Court of the State declaring unconstitutional a law passed by the legislature in 1899, restricting the hours of labor in mines to eight hours per day. The court held in this case that the law violated the provisions of the Colorado constitution providing that no special law should be enacted where a general one could be made applicable, and that no special or exclusive privilege or immunity whatsoever should be granted to any person or persons. In order, therefore, to reenact the law concerning miners, the constitutional amendment was proposed. Fifth, that the terms of district attorney and county judge should be increased from three to four years.

Labor Laws.—Besides the proposed constitutional amendment, limiting the hours of work for miners, several important laws were passed by the legislature in the interest of workmen. A law of 1897, prohibiting blacklisting and boycotting was repealed; for it was said that in practice, this law, while stopping boycotting, had no influence at all on blacklisting, and acted therefore solely in favor of employers. A resolution passed by the legislature declared it to be the sense of that body that all officers and purchasing agents of the various State institutions should wherever possible give preference to goods manufactured or produced in the State. Another law enacted that no railroad company should permit anyone of its employees who had worked for sixteen consecutive hours to go on duty again until he had had at least sixteen hours' rest. An act similar to that passed by many of the western mining States forbade any private corporation except railroad corporations and except corporations exclusively operating ditches, canals and reservoirs to pay their

employees in token, scrip or in any other article of value except money, and the wages must be paid in money semi-monthly. Any contract made between employer and employee in violation of this law was to be null and void. And if any corporation gave over its work to any contractor, then the obligations made by the law should fall upon the contractor, but the corporation should, nevertheless, be held responsible in case of default by the contractor. Damages recovered by employees from corporations for violation of the act should include a reasonable attorney's fee. Two curious features of this law were, first, that under it payments had to be made semi-monthly and could not be made weekly or at any other regular periods except that specified, and secondly, that the corporations operating ditches and canals who were exempted from the provisions of the law employed almost exclusively Chinamen and Italians, and not citizens of the United States.

Other Legislative Acts.—Several memorials were addressed by the legislature to Congress. One of these, while hoping for the reascendency of the American shipping, deprecated the ship subsidy bill on the ground that it would be class and special legislation; another denied the right of Congress in the executive to demonetize silver, and demanded that silver should be reinstated in the national currency; and still another applied to Congress under the fifth article of the constitution to propose a convention for the amendment of the constitution and the election of United States Senators by a direct vote. A resolution was passed declaring that as Kansas had adopted a resolution instructing its attorney-general to bring suit against Colorado to prevent the further diversion of the waters of the Arkansas River for irrigation purposes, and as Colorado had an unquestionable right to continue to divert these waters, the attorney-general should be instructed to defend the Kansas suit. An act was passed appointing a commissioner to act in conjunction with commissioners to be appointed by the Department of the Interior at Washington and by New Mexico to establish the correct boundary line between New Mexico and Colorado. The use of the United States flag for advertising purposes was forbidden. An act of 1897 abolishing the death penalty was repealed, it being thought that the number of homicides had largely increased since the enactment of that law. By the new law of 1901, the jury was authorized to fix either death or imprisonment for life as the penalty for murder in the first degree; provided, however, that no person under eighteen years of age should be sentenced to death, and provided that no person should be sentenced to death on circumstantial evidence alone. Educational enactments provided that in the public schools, two lessons should be given each week on the subject of the humane treatment of animals, and that truant schools might be established in cities of over 25,000, at which children were to be kept until they were fourteen years of age who had been guilty of wilful and "habitual" truancy, and who had regularly violated the rules of the schools which they attended. Street car railways were required to provide inclosures on the cars for their motormen, and apparently the railways were required to keep the inclosures all the year round, or at any rate whenever there was any inclement weather. The tax on insurance companies was raised from 2½ per cent. to 3 per cent. of the gross premiums. A noteworthy incident of the session of the legislature was a rule adopted in the House out of courtesy to Mrs. Hertz, its one woman member, forbidding the use of tobacco in the chamber. The speaker found it difficult to enforce the rule, but in a discussion of the subject, Mrs. Hertz declared that tobacco made her head ache.

State Officers.—Governor, James B. Orman, Democrat, elected for two years; term expires in January, 1903; lieutenant-governor, David C. Coates; secretary of state, David A. Mills; treasurer, James N. Chipley; auditor, Charles W. Cronter; attorney-general, Charles C. Post; adjutant-general, C. F. Gardner; superintendent of education, Helen L. Grenfell. Supreme Court.—Chief justice, John C. Campbell, Republican, term nine years; expires in January, 1903; associate justices, Robert W. Steele, Fusionist, and William H. Gabbert, Democrat.

Congressional Representatives (57th Congress). In the House—John F. Shaforth, from Denver, and John C. Bell, from Montrose—both Fusionists. In the Senate—Henry M. Teller, Silverite (until 1903), from Central City, and Thomas M. Patterson, Democrat (until 1907), from Denver.

COLORED METHODISTS. The number of negro Methodists increased considerably during 1901, and now exceeds 1,500,000. They not only are included in the distinct colored organizations maintained, but also constitute a part of other Methodist churches, some conferences of the Methodist Episcopal Church, South, notably, being comprised almost exclusively of a colored membership. The colored Methodist bodies, in the interests of their own race, maintain a number of colleges, have progressive publishing activities, and carry on an enterprising missionary propaganda. The more important African organizations are: African Methodist Episcopal Church (founded 1816), with 6,179 ministers, 5,715 churches, and 698,354 communicants; African Methodist Episcopal Zion Church (founded 1820), with 3,475 ministers,

2,955 churches, and 537,337 communicants; Colored Methodist Episcopal Church (founded 1870), with 2,061 ministers, 1,433 churches, and 204,972 communicants.

COLUMBIA UNIVERSITY. On October 7, 1901, Dr. Seth Low (*q.v.*) resigned the presidency of Columbia University in consequence of his nomination for mayor of New York on the Fusion ticket opposing that of Tammany Hall, and Dr. Nicholas Murray Butler (*q.v.*), dean of the school of philosophy, was chosen acting-president. At the same time President Low presented to the trustees his annual report for the academic year ending June 30, 1901. Pursuant to the newly established relations with Teachers College, the university will grant the degree of B.S. to graduates of the college who complete a professional course that has been offered, which is parallel, for example, to the course in chemistry leading to the same degree, and representing two years of general culture and two of professional work. Teachers College, on its part, has placed its entrance requirements to the level both of Columbia College and of the Schools of Applied Science. For its purely professional work, Teachers College will continue to confer a diploma rather than a degree.

In view of the success of the 1900 summer school, that form of university activity has been made a permanent feature of the university's work. The commencement of 1901, in addition to being the first graduation of students of Barnard and Teachers colleges under the new relation of those institutions with Columbia, was notable for the largest number of degrees conferred in the history of the university, involving the recognition of 661 students; for the conferring of all of the degrees in English, for the first time, and the disappearance of Latin from this function; and for the completion in temporary form of the great memorial dining-room in University Hall. On May 1, 1901, Miss Laura D. Gill, Smith '81, was installed as dean of Barnard College. Columbia's arrangement whereby public lectures have been maintained during the winter months at the Metropolitan Museum of Art and the American Museum of Natural History, has been so modified as to render a more distinctive service to the community. From 1902 lectures will be delivered at but one museum a year, relating to art at the Metropolitan Museum, and to science at the American Museum, which will be given by distinguished authorities. A corresponding change will be made at Cooper Union. In relation to the permission accorded in 1900 to students to enter the college without Latin as well as without Greek, it is of interest to observe that this permission so to enter, upon condition of taking the subject within the college, has proved to be a distinct encouragement to the study of the language. The president reports that the enlargement and increased flexibility of the curriculum during the past decade has been accomplished without departing from the old ideals too radically. "Some knowledge of at least one classical language is still required for the degree of Bachelor of Arts, and the curriculum demands almost as much required work as it did ten years ago. But great flexibility is given to the curriculum by permitting the student to take his required work pretty much at his pleasure, instead of compelling him to concentrate it within the first two years of his course." This system seems better to the faculty than an absolutely free election, such as prevails at Harvard and Cornell, on the ground that it insures to every student "such a liberal education as may be developed around a specified core of prescribed studies. On the other hand, it permits to a great degree the privilege of concentrating one's studies in a given department from the very beginning. It seems to the faculty better, also, than the group system, because it is more flexible." Practically, the curriculum in vogue at Columbia is the group system on a self-regulating basis.

Columbia received about \$354,120 in gifts and bequests during the academic year. The most important gift was an anonymous one of \$100,000 for the establishment of a department of Chinese languages, literatures, religion, and law, and especially for a chair to be known as the Dean Lung Professorship of Chinese. Later in 1901 it appeared that General Carpenter was the donor of this gift. President Low also reports the gift of \$12,000 from Dean Lung himself. "I doubt," said the president, "whether the history of education supplies the record of any similar gift from a Chinaman to a university of the western learning." Among gifts for permanent investment was one of \$40,000 from William Earl Dodge, for the erection of Earl Hall, the house of the Y. M. C. A., and \$100,000 from the associate Alumni for permanent investment. A new building representing an investment of over \$300,000 has been completed for the Horace Mann School, a school of observation connected with Teachers College. The Speyer School, the Teachers College experimental school, will be housed in a new building by October, 1902. A dormitory for Teachers College is being erected as a business venture by friends of the college.

The library, which numbers about 311,000 volumes, was increased during the year by 17,559 books, including several important collections. All departments showed an increase in attendance, and the faculty increased from 350 to 379. The total student attendance, omitting 579 students in the summer session of 1901, and omit-

ting names duplicated, was 3,524, distributed as follows: college, 476; law, 423; College of Physicians and Surgeons, 797; schools of applied science (mines, chemistry, engineering, and architecture), 513; non-professional graduate schools (political science, philosophy, pure science), 782; Barnard College, 301; Teachers College, 528. In addition, 679 students received instruction through the Teachers College extension courses. See UNIVERSITIES AND COLLEGES, and PSYCHOLOGY, EXPERIMENTAL.

COMETS. See ASTRONOMICAL PROGRESS.

COMMERELL, Sir JOHN EDMUND, V.C., British admiral, died in London, May 21, 1901. He was born in London, January 13, 1829, and entered the navy in 1842. Serving through the first China war and in various campaigns in the East, he was promoted to lieutenant in 1848. From that time continuously, until he was sent to parliament in 1885, he served in nearly every part of the world, rising in rank to vice-admiral. Throughout his career he was deeply interested in the development of the British navy, and was intrusted with the command of the new turret ship *Monarch* in 1869; one of his first duties as commander of that vessel being to carry home to the United States the body of the great philanthropist, George Peabody. Admiral Commerell was known to stand very close to the Court and represented the sovereign frequently at foreign manœuvres. While in parliament he did much to achieve the passage of the Naval Defense Act, for which he was rewarded with the rank of Admiral of the Fleet (1892).

CONGO FREE STATE, a country of central Africa under the sovereignty of Leopold II., King of the Belgians, has an estimated area of 900,000 square miles and a population, according to the official estimate of 1896, of 30,000,000. Notwithstanding the efforts made in recent years by the Congo authorities to encourage immigration, the white population in 1901, according to a report published in November, was only 2,204, including all officials and army officers; of the total, 1,318 were Belgians, 170 Italians, 115 English, 114 Dutch, and 107 Swedes. Portuguese, German, French, Danes, and Americans were represented in smaller numbers. Boma, the capital, with 437 Europeans has the largest white population of any town.

Government, etc.—Under the provisions of the Berlin congress of 1885, the Congo Free State is placed under the sovereignty of Leopold II., who governs the country through a cabinet at Brussels and a governor-general at Boma. The fourteen districts are administered by Belgian commissioners, who are assisted by various civil and military officials. In 1889 the king bequeathed his sovereign rights to Belgium, and on July 3, 1890, the Free State made an agreement with Belgium whereby the latter had the option of annexation after a period of ten years. (See the paragraph Proposed Annexation.) The army consists of 23 regiments of native troops, with an effective strength of nearly 12,000 men, commanded by European officers. For 1900 the estimated revenue, which accrues largely from the state domain, customs, and transport dues, was 26,256,500 francs (the franc equals 19.3 cents), and the estimated expenditure, largely for the departments of finance and the interior, 27,731,254 francs. For 1901 the estimates were 28,700,000 francs for revenue and 28,549,000 francs for expenditure. The public debt is reported at about 116,200,000 francs. In November, 1901, it was announced that the Brussels administration of the Free State was about to float a loan of £2,000,000 (about 50,000,000 francs) for the construction of important public works, including railways.

Production and Commerce.—The most important products are rubber, ivory, palm-kernels, palm-oil, and ground-nuts. Various minerals occur, but mining has not been developed. Notwithstanding the great difficulties of transportation commerce has advanced rapidly. In the special trade in 1895 the imports amounted to 10,685,848 francs, and the exports 10,943,019 francs; in 1899, the special imports and exports were valued at 22,325,847 francs and 36,067,959 francs respectively; in 1900, 24,724,110 francs and 47,377,400 francs respectively. The general commerce in 1900 amounted to 31,803,213 francs for imports and 51,775,980 francs for exports. The leading imports in 1899 were valued in francs as follows: Tissues and clothing, 5,147,610; steamers and machinery, 4,197,129; foods, 3,887,912; and metals and metal wares, 1,667,391. The chief exports for the same year were: Rubber, 28,100,917; ivory, 5,834,620; palm-nuts, 1,293,413; and palm-oil, 734,511. Of the imports nearly three-fourths came from Belgium, and over five-sixths went to that country.

Communications.—The Congo River is navigable as far as Matadi, a town 27 miles above Boma and 112 miles from the Atlantic. From Matadi to Stanley Pool (Leopoldville) there are numerous rapids, and communication is effected by a railway about 250 miles in length. Above Stanley Pool there are about 1,000 miles of navigable water. Besides a small flotilla of sailboats, the government has 6 steamboats below the rapids and 26 above. A short line of railway—20 miles—is in operation between Boma and Mayumbe. In November, 1901, the Congo administration authorized the formation of a company which proposed to construct in the region of the Upper Congo nearly 1,000 miles of railway, a part of which is to connect the Congo River with the region

of the great lakes. It is not expected that these railways will be completed within eight or ten years. There are reported 795 miles of telegraph lines. It was announced in the spring of 1901 that the telegraph will ultimately be extended to Lake Tanganyika, where it will connect with the system of German East Africa.

Proposed Annexation.—The convention of 1890, under which Belgium acquired the right of annexation after ten years, expired June 3, 1901. Under this convention also the Free State received from Belgium a loan of 25,000,000 francs without interest during the ten-year period. The question of annexation came up for discussion in the Belgian chambers in the spring of 1901. The increasing prosperity of the state was used as an argument for annexation. The opponents of the plan, however, maintained that this prosperity is only apparent, and pointed out that the trade with the Free State, as compared with Belgian trade with civilized countries, is comparatively small; they added, moreover, that the "prosperity" was due to a system of barbarous spoliation and the imposition upon the natives of forced labor very similar to slavery—a system that is not only unjust but is economically false. On the other hand, Belgian financiers and merchants, who are almost all in favor of Congolese development, believe that the Free State is administered well enough, and accordingly argued that the chambers should leave existing conditions alone. M. Beernaert, under whose ministry the convention of 1890 was concluded, favored immediate annexation, but realizing that Belgium was hardly ready to undertake colonial administration, he proposed that a law be enacted under which for a time the king be empowered to administer the colonial territory. The king, however, opposed immediate annexation and refused positively to administer the Free State except on his own account; that is, under the existing conditions. M. Beernaert thereupon withdrew his proposition. The Belgian ministry finally proposed in June, 1901, to defer annexation but to reserve the right to effect such annexation at such future time as the king might choose, and in order to reserve this right it further proposed that the Congo loan of 25,000,000 francs should continue without interest. This plan, which simply maintains the *status quo*, and which appeared to be fairly acceptable to both the advocates and the opponents of the annexation policy, was adopted by the chambers early in August.

The proposed annexation called forth in the press renewed comments on the alleged despotic rule of the Congo administration. The Manchester *Guardian* declared that the administration had violated almost all the provisions of the Berlin agreement by which the Free State was erected. The journal stated that although private slavery had been abolished, the administration had practically enslaved large numbers of the population, intimidating them by the "armed savages who constitute the Congo State militia and police;" and, it continued, "the Congo State, founded on a basis of free trade and philanthropy, has become a great commercial monopoly, utterly regardless of justice or humanity in its pursuit of gain. Uncontrolled by public opinion, it has permitted or connived at some of the worst excesses recorded in the history of European rule in Africa.

The Bahr-el-Ghazal.—According to an agreement signed in May, 1894, the boundary between the Free State and the British territories in the upper Nile valley was fixed, and Great Britain leased to the Free State, during the reign of King Leopold, the region extending south from the 10th parallel to Albert Nyanza, and known as Bahr-el-Ghazal and the Lado *enclave*. In August of the same year the boundary between the Free State and French territory was defined. In deference to a protest of the French government, King Leopold waived the rights granted by Great Britain except in the Lado district. This action, the Congo authorities maintained, did not invalidate the lease contracted with Great Britain, while Lord Salisbury, the British foreign minister, held the opposite opinion. In May, 1901, negotiations between Great Britain and the Free State took place, looking toward the reestablishment of the latter's rights in the Bahr-el-Ghazal. On July 25 the Brussels *Soir* announced that a settlement had been reached, whereby the rights in question were granted to the Free State during the reign of King Leopold.

Other Events.—Several native outbreaks occurred during 1901. In the spring there were uprisings at Liboko and Diobir, and in June it was reported that the Budjas had defeated the Congo troops in the district of Welle, killing 250 native soldiers. In June, also, it was announced that the tribe of Batatelas, who revolted against Baron Dhanis in 1895, had been definitely subdued, but in the following month news came that they continued to give trouble, and that 1,000 rebels were at large. The Congo authorities made elaborate preparations for the repression of the Batatelas, and in November it was announced that Major Malfeyt had killed three chiefs and taken 600 prisoners. Revolts also occurred in the Mongolla district and in the region of the Kassai, but in September were making no headway. An important military post was established at N'Dobo. In 1901 there was a movement in Cuba among the descendants of Congolese negroes, who, it is said, number about 18,000, for a return to the African fatherland.

CONGREGATIONALISTS passed through, in 1901, an eventful year of their history. At the sixty-ninth annual meeting of the Sunday-school and Publication Society in April, it was reported that the *Congregationalist* had been transferred to that society—an occurrence of note, since there seemed at one time a danger that the paper, which began publication in 1849 and has since acquired a large circulation, would pass from denominational hands. The Congregational Home Missionary Society, to which a large proportion of Congregational churches owe their existence, held its seventy-fifth annual meeting in Boston, May 14-16, when the friction over the administration of the finances, due to the National Society and its State auxiliaries operating in the same field, was harmoniously adjusted by an agreement that the *status quo* be maintained for the ensuing year and that the matter be referred to a committee of fifteen, satisfactory to both elements. This committee met subsequently and decided upon a plan, to be recommended at the next annual meeting, which provides substantially for a federation of the State societies with formal representation in the National. The Home Missionary Society, which has nearly 1,900 branches, distributed as far north as the Arctic Circle, and including four in Cuba, though a large proportion are in the West, greatly reduced its debt in 1901 and reports total receipts of \$538,986. Dr. N. D. Hillis succeeds General O. O. Howard as president of the organization. The triennial session of the Congregational National Council was held in Portland, Me., October 12-17, 1901. This council is composed of delegates from local organizations, and though the supreme body of the church, is purely a deliberative assembly in that its function is advisory only. A memorial to Congress on the subject of a constitutional amendment against polygamy, the commendation of the Anti-Saloon League, a caution to ministers in relation to the marriage of divorced persons, and a radical change in the Ministerial Relief Society, providing for centralization of management in administering trust funds, were features of the meeting, but the most important event was the report of the committee on the federation of Congregational missionary societies. This recommends (1) "the constitution of the missionary societies' membership in a limited governing body, chosen proportionately from the different States; (2) that the various missionary societies have each one administrative head; (3) that all missionary publications be united in one, combining home and foreign work; (4) that the missionary societies hold annually two meetings, one foreign and one union home meeting, alternately in the East and West." The next meeting of the council will be held in 1904, in Des Moines, Ia. Officers: moderator, Rev. Amory H. Bradford, D.D., Montclair, N. J.; secretary, Rev. Asher Anderson, D.D., Auburndale, Mass.; treasurer, Rev. S. B. Forbes, Hartford, Conn.; registrar, Rev. Joel S. Ives, Hartford, Conn. The following statistics, which include Cuba and Hawaii, give a summary of the general status of the church in the year 1901: churches, 5,724; members, 639,957; Sunday-school members, 749,216; members of young people's societies of Christian Endeavor, 187,953; contributions for benevolences, \$2,212,536; expenditures, \$7,512,686—for the United States only; churches, 5,650, gain (in the triennium ending 1901), 36; members, 633,349, gain, 7,485; Sunday-school members, 671,743, loss, 13,961; members of young people's societies, 186,448, loss, 32,103; benevolent contributions, \$6,214,570, loss, \$547,260; home expenses, \$21,246,465, increase, \$1,023,906. In the Sunday-school membership should be included also 69,673 in independent Sunday-schools.

Other occurrences of interest during 1901 were the resignation of Professor George H. Gilbert from the chair of New Testament interpretation in the Chicago Theological Seminary, and the dismissal from the ministry and membership in the church of Professor George D. Herron by a council of the church in Grinnell, Ia. Professor Gilbert, whose case has attracted attention for a year or more, after a year's leave of absence, was unable to change his views respecting the Lord's pre-existence, which were unsatisfactory to the board of directors, and was allowed to resign without reflections on his orthodoxy, his place being temporarily filled by Professor Shailer Matthews, of Chicago University. Professor Herron, formerly professor of applied Christianity in Iowa College, was found guilty of "immoral and un-Christian conduct," the action being based on his divorce and conduct previous to his remarriage, which was solemnized with an entirely novel ceremony that occasioned much comment in the press. Mr. Herron offered to the council a defense of his divorce, in extenuation setting up alleged faults in the marriage system.

CONGREGATIONAL METHODIST CHURCH. THE reports a year of activity, particularly along the line of church building, more churches having been built in 1901 than in any previous year. The denomination, which includes both white and colored, its negro constituents, over 300 in number, being separately organized into conferences, had in 1901 a membership of 21,000, with 345 ministers and 350 churches, a notable increase over the preceding year. The Quadrennial General Conference of the church convened at Rose Hill, Miss., in November, 1901, when provision was made to increase the publishing facilities and, within a few months, to establish a missionary in India. In 1902 the church will celebrate its semi-

centennial, as the first half century since its organization, in Monroe County, Ga., closes on May 8. *The Watchman*, published at Milmer, Ga., Rev. Rolfe Hunt, D.D., editor and publisher, is the general organ of the church.

CONGRESSIONAL LIBRARY, established at Washington in 1800; destroyed in 1814 by the British, and refounded by the purchase of the library of Thomas Jefferson. The last report of Dr. Herbert Putnam, librarian of Congress, is for the year ending June 30, 1901, representing the fourth year in the present quarters. During the year the appropriations and expenditures of the library amounted to \$563,257. The total accessions for the year were 76,481 volumes, 19,000 manuscript pieces, besides a great number of maps and charts, prints, and pieces of music. An increase in the appropriation enables the library to make progress in completion of many fragmentary sets and in the acquisition of standard material in many departments of learning. In this way, more than 26,000 volumes were purchased during the year, while 7,933 were acquired by copyright, and 6,476 acquired by international exchange. Gifts were received from more than two thousand different sources, and an effort is now being made to complete the files of the publications of the various State governments, which receive all federal documents and are under no obligation to make returns. One of the most important features of the accessions has been that of the manuscripts. Among these were the Robert Morris papers, relating to the finances of the Revolution, consisting of 6,000 letters, less than 300 of which have ever been printed. There were also the account books of the Carroll family covering the first half of the eighteenth century, manuscripts relating to the Spanish occupation of Florida, the Columbus codex, consisting of a copy of the various hereditary grants, charters, and privileges made to Columbus, this copy being made by the public notary under the personal direction of Columbus. There are only two other copies in existence, and these are of priceless value. An extensive series of manuscripts relating to the Franco-Prussian War and the Commune of 1871 were added, as also were the Porter papers written by Commodore Porter, covering the period from 1805 to 1812. An important part of the work of the library at present is in the card cataloguing of the contents of the entire library, which now contains more than a million printed volumes. More than 100,000 titles were added to the catalogue list during the year. In this connection the Congressional Library is doing a work of great public service in that it proposes to distribute copies of these catalogue cards to other libraries, thus enabling them to secure the benefit of expert work in cataloguing and printing cards at a fraction of the cost of doing the work independently; and second, in order to place in certain centres of research as complete a statement as possible of the contents of the international collections at Washington. Another important phase of the work of the library during the year was the publications. These included (1) *A Union List of Periodicals, Transactions, and Allied Publications currently received in the Principal Libraries of the District of Columbia*, 315 pages; (2) *A Check List of American Newspapers in the Library of Congress*, 293 pages; (3) *A List of Maps of America in the Library of Congress, preceded by a List of Works relating to Cartography*, 1,137 pages; (4) *A Calendar of Washington Manuscripts in the Library of Congress*, 315 pages; (5) *A List of Books Relating to the Theory of Colonization, Government of Dependencies, etc.*, 156 pages; (6) *A List of Books with Reference to Periodicals on Mercantile Marine Subsidies*, 18 pages; (7) *A List of Books with Reference to Periodicals on the Spanish West Indies*, 18 pages; (8) *A List of Books with Reference to Periodicals on Porto Rico*, 55 pages. During the year the total number of visitors to the library building was 832,370, a daily average of 7,211. A relatively small proportion of these, however, are recorded as readers, although there were issued in the main reading-room more than 400,000 books during the year. The question of Sunday opening for the library is still unsettled, and the librarian makes a strong plea that it be opened, at least after 2 P.M.

CONNECTICUT, one of the New England States of the United States, has an area of 4,990 square miles. The capital is Hartford. The population in 1900 was 908,355, while in June, 1901, as estimated by the government actuary, it was 927,000. The populations of the larger cities in 1900 were: New Haven, 108,027; Hartford, 79,850; Bridgeport, 70,996; and Waterbury, 45,859.

Industries.—The maintenance of Connecticut's preeminence as a manufacturing State was fully shown by the results of the census of 1900. Since 1850 the population of the State has increased from 370,792 to 537,628, or 145 per cent. During the same period the average number of industrial employees has increased 248.3 per cent., from 50,731 to 176,694, and comprised in 1900 19.5 per cent. of the total population. In the latter year there was invested in the 9,128 manufacturing establishments reporting, an actual capital of \$314,696,736, exclusive of capital stock; the gross value of the manufactured products for the year was \$352,824,106, and the net value, exclusive of products re-used in the processes of manufacture, \$208,014,581. The position which Connecticut holds in manufacturing, notwithstanding that it is forty-third among the States in size and twenty-ninth in population, is due, according to the

census report, "in part to its excellent communication by rail and water with all parts of the country; to its geographical location, by which it can handle a large export trade; to its water power; to its plentiful supplies of labor and capital, the former gathered easily in the great centres of the East, and the latter coming to it not alone from its profitable manufactures but also from its large insurance and banking interests; to its joint-stock laws; and, above all, to its early settlers and their descendants, men of great inventive genius, frugality, and industry." In 1890 Connecticut stood tenth among the States in the value of her manufactured articles; from 1890 to 1900 the population increased 21.7 per cent., and the value of the products 42.1 per cent., or at a rate double that of the increase in population. The value of some of the most important of Connecticut's manufactured products for 1900 is as follows, the value of the same product for 1890 being given in parenthesis: ammunition, \$9,823,712 (\$3,838,774); brass manufactures—total, \$48,526,868 (\$22,309,894); brass and copper, rolled, \$29,787,282 (\$4,169,938); brass castings and brass finishing, \$9,470,427 (\$7,428,011); brassware, \$9,269,159 (\$10,711,945); foundry and machine-shop products, \$18,991,079 (\$13,314,156); hardware, \$16,301,198 (\$11,995,023); plated and britannia ware, \$9,538,397 (\$7,569,920); textiles—total, \$49,265,752 (\$46,757,780); cotton goods, \$15,500,842 (\$15,409,476); silk and silk goods, \$12,378,981 (\$9,788,951); woolen goods, \$8,097,218 (\$9,082,493). Connecticut more than any other State is noted for "notions" and specialties, especially those worked in metals. The number of these is very great and of the widest variety, from mouse-traps and necktie fasteners to watches and clothes-dryers. The relative importance of the manufacturing cities has not changed since 1890, New Haven still leading, and being followed by Bridgeport, Waterbury, Hartford, Meriden, and New Britain respectively. Between them, these six cities, the only ones having a population of over 20,000 inhabitants, produced, in 1900, 44.5 per cent. of the total value of articles manufactured in the State, as against 41.3 per cent. in 1890. As showing still further the extent of the concentration of manufactures in Connecticut, it may be stated that sixty-one towns and cities, containing 82.6 per cent. of the population, produce 92.4 per cent. of the value of industrial articles. And this tendency appears to be still increasing.

Constitutional Revision.—On June 13, 1901, the Connecticut legislature passed a bill to submit to the electors in October the question of calling a convention to revise the State constitution. This act was the result of an agitation conducted for some years for the abolition of the existing system of representation in the popular assembly. This system, which is a relic of the time when Connecticut was made up of a few small towns, provides in effect that the basis of representation in Connecticut shall be by townships instead of population. Senators are chosen by popular vote, but assemblymen are chosen by towns, each town, however small, being entitled to at least one. With the growth of Connecticut cities, this system has resulted, as stated by Governor George P. McLean, in enabling less than 20 per cent. of the people of Connecticut to elect a clear majority of both branches of the general assembly, and so secure absolute control of the State government; for some towns having a population of less than 500 retain two representatives, while others with ten times that number are entitled to but one. To remedy this condition, moderate amendments to the constitution were proposed by the Republican leaders, giving every small town one representative, every town of more than 2,500 inhabitants two representatives, and allowing towns one additional representative for every 20,000 inhabitants. But this amendment, although indorsed by the Republican State Committee, was voted down by the country members. In his annual message, Governor McLean had especially advised the legislature against calling a convention for the general revision of the constitution, stating that such action was more radical than the conditions warranted, and that, since all the important provisions of the constitution had already been judicially construed by the courts, "any change in the text, however slight, might entail much hardship, uncertainty, and expensive litigation." When, however, an amendment to the constitution as regards representation was found to be impossible of passage, an agreement was made to call a constitutional convention, provided, however, that this convention should be composed of one delegate from each town, large or small, and that the convention should not be allowed to deny the right to any town to have at least one representative in the House. Although these stipulations give the control of the convention wholly to the rural members, yet their effect is in some degree modified by the fact that the constitution when formulated must be submitted for ratification, not to a vote by townships, but to the voters of the State as a whole.

Corporation Law.—A widely discussed act passed by the Connecticut legislature provided in effect that corporations might be formed in the State by the payment of a small tax, and be thereafter practically free from any State supervisory power. This law was stated to have been passed to induce corporations doing business outside of Connecticut to incorporate in that State; thereby turning a neat sum yearly into the State treasury, and without in any way prejudicing existing industries in the State. The law provided that upon payment of 50 cents for each \$1,000 of capital

up to \$5,000,000, and of 10 cents additional for each \$1,000 of capital over \$5,000,000, corporations might obtain charters forever afterward exempt from State taxation. The annual meetings of the corporation were not required to be held in Connecticut, nor was any one in Connecticut required to hold stock in the corporation, and the corporation was expected only to keep in the State a nominal office and agent. In brief, as was pointed out, "the cheapest charter that could be bought anywhere in the world would be issued strictly upon an advance payment," and the corporation thus equipped could proceed without hindrance to establish its business in all other States of the Union except that of its origination. With the consent of stockholders representing two-thirds of the stock, any such corporation might change its name, the nature of its business, or might increase or reduce its capital stock. Two or more similar corporations carrying on the same or a similar business might consolidate. The stock, when fully paid for, was to be absolutely non-assessable. Probably, however, the most distinctive clause of the act was that which provided that while such corporations might not carry on any railroad business within the boundaries of Connecticut, or conduct any business whatsoever in Connecticut requiring the condemnation of property or the obtaining of franchise rights; these restrictions were not to hold, provided that the business was conducted outside the limits of the State. In commenting upon this act, financial journals pointed out that it was already too much the fashion for one State to pass laws permitting the incorporation of companies intending to do business in another State. For laws thus passed rarely imposed proper restrictions upon the corporations, and, moreover, if the State in which the corporations did business endeavored to restrict or govern them, the corporation could always respond by claiming that they were not subject to the law of the State in which they did business, but only to the interstate commerce law and to the federal courts. In this way, the several States became unable to control the character of large corporations doing extensive business within their boundaries.

Labor Laws.—An interesting law for the benefit and protection of unemployed labor was passed by the Connecticut legislature. This provided for the organization and establishment by the commissioner of the Bureau of Labor Statistics of free employment bureaus in the cities of New Haven, Bridgeport, Norwich, and Waterbury, and provided also that hereafter no private employment bureaus, except for the employment of school teachers, should be opened in the State without being licensed by the commissioner. Bureaus so licensed should be required to file a bond with the commissioner, and should keep registers open for the inspection of the commissioner. They were prohibited from receiving any registration fee greater than \$2.00, and if they did not obtain employment for the applicant or the applicant did not accept the employment offered within a month from the time of application, then the fee should be returned to the applicant on demand. Moreover, a receipt for the fee was required to be given to the applicant, and on the back of the receipt was to be printed the law requiring the return of the money to the applicant under the conditions noted above. A labor law for the protection of Italian contract laborers provided, first, that no contractor or foreman should receive any fee from laborers for furnishing employment to them; second, that shanties, lodging houses, etc., used as places of abode by such laborers should be examined by the health officers, to whom power was given to see that they were kept in a sanitary condition; and, third, that agents who sold goods to laborers and who charged them more than a current market rate for the same should be fined. An act for the licensing of barbers similar to that passed in several other States, but more stringent in its regulations, provided that hereafter no license should be issued to applicants until they had served three years as a barber's apprentice or in a barber's school and had passed an examination showing them among other things to be free from contagious diseases, and possessed of sufficient knowledge concerning the common diseases of the face and skin to avoid the aggravation and spreading thereof. Certificates issued by the licensing board might be revoked for cause.

Other Laws.—The sentence for kidnapping was made imprisonment for not more than thirty years. Another act provided that whenever a temporary injunction had been granted by any judge, other than a judge of the Supreme Court, the Superior Court might in term time, or any judge of the Superior Court, might in vacation, dissolve such temporary injunction. The appointment of a tax commissioner was provided for, who should have power to examine witnesses, compel the production of papers, and should examine in each town to ascertain whether the tax had been properly collected and report thereon to the legislature. The Commissioners of Fisheries and Game were empowered to establish State game preserves by leasing tracts of land under the condition, however, that these tracts might be used by their owners for all purposes except that of game hunting. An act endeavoring to avert accidents from motor vehicles provided that these machines should not run faster than fifteen miles an hour outside any city, nor more than twelve miles within. They should be required, moreover, to reduce speed at intersecting streets or on meeting

wagons; towns, however, might grant permits allowing the motor vehicles to go at a greater speed. An act to institute indeterminate sentences provided that persons who should be sentenced to prison, except for capital crimes, should be sentenced first for the maximum punishment under the law, and, second, for a minimum period in the discretion of the judge, not less than one year; persons, however, who had already been twice sentenced should on the third sentence be given a maximum term of thirty years, and where persons were sentenced for two or more offenses, the first sentence only should be given a minimum term, and the total maximum term should be the combined maximum sentences for the several offenses. The warden and the majority of the board of directors of the State prison were authorized to issue paroles to prisoners who had served their minimum term, and these paroles might thereafter be revoked or made permanent.

Elections.—At the election held on October 7, 1901, to determine whether the constitution should be revised or not, the townships voted almost solidly against the proposition, and it was only through the equally solid affirmative vote of the city that the proposal was carried. Delegates to the convention were chosen at the regular elections in November, and the convention was ordered to meet January 1, 1902. While no general State officers were chosen at the November elections, much interest was shown in the election of municipal officers; notably by the election, as mayor of Bridgeport, of Dennis Mulvihill, a stoker by trade, who had interested himself in politics, and who defeated his Republican opponent by a large majority. Mr. Mulvihill's sole platform was that of an economical and honest administration of the business affairs of his city, and he stated that as he himself had always been poor, he would appreciate the value of every dollar of the taxpayers' money.

State Officers.—Governor, George P. McLean, Republican, elected for two years, term expires in January, 1903; lieutenant-governor, Edwin O. Keeler; secretary of state, Charles G. R. Vinal; auditors, Walter A. Riley and James P. Bree; treasurer, Henry H. Gallup; comptroller, Abiram Chamberlain; attorney-general, Charles Phelps; adjutant-general, G. M. Cole; insurance commissioner, Edwin L. Scofield. Chief justice, David Torrence, Rep., term eight years, expires October, 1909; associate justices, S. O. Prentice, Rep., Frederic B. Hall, Rep., Simeon E. Baldwin, Dem., and William Hammersley, Dem.

Congressional Representatives (57th Congress). In the House—E. Stevens Henry, from Rockville; Nehemiah D. Sperry, from New Haven; Charles A. Russell, from Killingly; and Ebenezer J. Hill, from Norwalk—all Republicans. In the Senate—Orville H. Platt, from Meriden, and Joseph R. Hawley, from Hartford—both Republicans.

CONSUMPTION. See TUBERCULOSIS and CHARITY ORGANIZATIONS (paragraph Consumption).

CONWAY, Sir WILLIAM MARTIN, English explorer and author, was made Slade professor of fine arts at Cambridge University in 1901. He was born at Rochester in 1856, and was educated at Repton, and at Trinity College, Cambridge, where, under the influence of the well-known university librarian, Henry Bradshaw, he became interested in the early history of printing and wood-engraving. At Mr. Bradshaw's suggestion he visited the important libraries of Europe, collecting material for his book on the *History of the Wood-Cutters of the Netherlands* (1884). In the same year he was appointed professor of art at University College, Liverpool, where he remained until 1888. His first expedition was to Egypt, Syria, Greece, Turkey, and Asia Minor, in 1889; in 1892 he went to the Himalayas, where he succeeded in climbing a peak 23,000 feet in height; in 1894 he explored the Alps; in 1896-97 he penetrated into the interior of Spitzbergen; and in 1898 he led a party into the Bolivian Andes, where he ascended Mt. Aconcagua (23,080 feet) and two other peaks of lesser altitude. The results of his numerous expeditions have been embodied in a number of volumes of the greatest interest and value to the scientific world. The titles include: a series of *Climbers' Guide-Books to the Pennine and Lepontine Alps* (1890); *Climbing and Exploration in the Karakoram-Himalayas* (1894); *The Alps from End to End* (1895); *With Ski and Sledge over Arctic Glaciers* (1898); and *The Bolivian Andes* (1901). Important also are his books on art and art history, of which may be mentioned *The Artistic Development of Reynolds and Gainsborough* (1896); *Early Flemish Artists* (1887); *The Literary Remains of Albrecht Dürer* (1889); and *The Dawn of Art in the Ancient World* (1891). He is a fellow of the Society of Antiquaries and of the Geographical Society, and he has been chairman of the Society of Authors (1895, 1898, 1899). See BOLIVIA.

COOK, JOSEPH, American lecturer, died at Ticonderoga, N. Y., June 24, 1901. He was born there January 26, 1838, was educated at Yale and Harvard universities, at the Andover, N. H., Theological Seminary, and in Germany. Although an ordained clergyman, he devoted his energy chiefly to lecturing. In 1875 he instituted the series of "Boston Monday Lectures," that continued, with few interruptions, until his death. In 1880-82 he made a lecturing tour of the world, and in 1895 lectured

in Australia. Mr. Cook, whose lectures were concerned chiefly with the relations of science and religion, published at various times eleven volumes of the Monday lectures, and also a volume on *Current Religious Perils*. In 1888 he established *Our Day*, a magazine devoted to a number of religious and social reforms.

COOPER UNION, FOR THE ADVANCEMENT OF SCIENCE AND ART, New York City, founded by Peter Cooper, and chartered in 1857. The forty-second annual report, submitted June 5, 1901, records that owing to expenditures in remodeling the building, \$107,000 were expended. Owing to the increase of students, much space that had formerly been rented, could be turned into accommodations for the pupils, thus cutting down one of the chief sources of income. The trustees report that an additional endowment of \$300,000 is needed to balance the annual receipts and expenditures. During the past two years, the joint gifts from Mr. Andrew Carnegie and the Cooper heirs amounted to \$1,200,000. In addition to these gifts, a bequest of \$20,000 was received from the estate of Oswald Ottendorfer, and Mr. J. Pierpont Morgan contributed three of the most valuable collections of textile fabrics to be found in Europe, thus making this collection equal to any in the world. During the year ending May, 1901, between 500,000 and 600,000 persons frequented the reading-rooms. The arrangements made for the use of the Great Hall for free lectures for the people was continued during the past year, two nights under the control of the Board of Education, one night in cooperation with Columbia University, and two nights in cooperation with the People's Institute. The idea of free lectures, now so universally prevalent, originated in Cooper Union more than forty years ago, and its growth has been amazing. The officers are: president, Edward Cooper; secretary, Abram S. Hewitt; treasurer, Edward R. Hewitt. A vacancy in the board of trustees was filled by the appointment of Mr. Andrew Carnegie. An admirable account of Cooper Union was published in February, 1901, in *The Iron Age*, and in *The New Yorker Staats Zeitung*.

COOPERATION. The rapid growth of the trust principle in business organization in recent years has given a marked stimulus to the development of cooperation in its various forms. Most practical of these appears to be cooperative buying and cooperative selling. Retail dealers are showing an increasing readiness to unite their purchases, thus in many cases eliminating the jobber and securing carload rates. The farmers are everywhere adopting the same idea, organizing associations modeled on the fruit-growers' associations of California, in order to control the marketing of their own product. This development has been particularly noticeable in the lines of market gardening and dairy farming. The movement has also spread to the grain districts where the basal idea of the Grange has been recently revived. During 1901, upwards of fifty Farmers' Cooperative Grain Associations were organized in Kansas to control their own elevators and buy grain direct from the farmers, thus making them independent of the middleman. In one instance the association paid five cents more for wheat than the regular dealers. Cooperative telephone and insurance companies are also multiplying. Cooperation among final consumers has made little progress as yet, but indications point to rapid development in this field. Of peculiar interest in this connection are the various cooperative commonwealths in existence in the United States, which seek to unite producers and consumers in one organization whose earnings are divided among the members on some basis fixed by agreement. The July (1901) *Bulletin* of the Department of Labor contained an elaborate investigation by Rev. Alexander Kent of the present status of cooperative communities in the United States. He divides them into (1) communistic, (2) socialistic, and (3) partially cooperative. The existing societies are the Shakers, who now number seventeen societies in nine States, the Amana Society, in Iowa; the Harmony Society, near Pittsburg, Pa.; the Ruskin Commonwealth, founded in Tennessee in 1894, and subsequently transplanted to Duke, Ga.; the Cooperative Brotherhood at Burley, Wash.; the Brotherhood of the Cooperative Commonwealth, organized in 1895, and also located in Washington; the Industrial Brotherhood at Thomaston, Me.; the Colorado Cooperative Company in Montrose County, Col.; the Straight-Edge People, with headquarters at 240 Sixth Avenue, New York; the Cooperative Association of America, organized at Lewiston, Me., in 1900; the National Production Company, with headquarters in Florida, since become a part of the Cooperative Association of America; the Cooperative Industrial College near Camp Creek, Ga.; the Commonwealth of Israel, in Dallas County, Mo.; the Altruist Community, of St. Louis, Mo.; the Association of Altruists, at Moorestown, N. J., founded in 1900; the Lord's Farm, at Woodcliffe, N. J.; the Mutual Home Association, at Carr's Inlet, Puget Sound, found in 1896; the Mutual Aid Cooperative Association, with headquarters at 864½ Howard Street, San Francisco; Freedom Colony, in Bourbon County, Kan.; the Willard Cooperative Colony, organized in 1895, in Cherokee County, N. C. Most of these societies have been organized from philanthropic or religious motives, and are not distinguished for practical business sense. Mr. Kent concludes with reference to these Utopian communities that so long as some ideal,

whether theocratic or social, continues to dominate their policies, so as to subordinate the instincts of individual self-seeking, while they remain isolated from the outside world, they can achieve a fair measure of success. The continued growth of the Anama Society, which was founded in 1861, is an illustration of successful cooperation. Its members speak only German, and have little contact with their neighbors. Under ordinary circumstances, however, when brought into close contact with the outside world these communistic communities are generally short lived. A number are mentioned as having dispersed. It is worthy of remark, however, that some of these enterprises which have been started within the last five years are organized on a business basis. They do not attempt to realize impossible ideals, but to secure for their members the profits of production and distribution. These give fair promise of success. Most conspicuous is the Cooperative Association of America, a corporation organized under the laws of Maine. This company was organized by Bradford Peck, a successful business man of Lewiston, Me., who had already introduced the cooperative idea into the Bradford Peck Company Department Store in Lewiston. The capital stock is \$10,000, on which, however, no dividends will ever be paid because all earnings go to co-workers. The purpose of association is ultimately to form within itself a federation of all legitimate branches of business. The association was started in the spring of 1901, and already controls the largest grocery and general market business in Lewiston and Auburn. It also conducts a large restaurant. Both buildings are the property of the association, which expects to absorb several of the large business interests of the city. The association has planned to purchase several large farms near Lewiston from which to supply its own stores and its co-workers with everything that can be produced from the farm. The grocery store and market have over 600 pledged customers who trade with it regularly. Each one has invested \$25.00 in the business with the understanding that he is to make his purchases at the store and to receive every six months as a rebate most of the net profits. The organization aims to pay each one of its co-workers exactly what his labor creates, either directly in wages or by a reservation for investment in building and machinery.

In this connection it is of interest to note the continued progress of the cooperative idea in Europe. The cooperative movement in Belgium in 1900 numbered 251 societies. During 1898-1900 the new cooperative societies founded were as follows:

Savings and loan societies.....	116
Creameries	210
Consumption	124
Purchase and sale.....	67
Breweries and distilleries.....	65
Production	48
Insurance	31
Miscellaneous	45

On January 1, 1900, there were in Belgium more than 1,800 cooperative societies, with an estimated membership of 200,000. The "Rockdale" is the system of co-operation there employed. It consists in selling at a profit and then distributing the profit at the end of the half year or year.

In a recent number of the *Economic Review*, the present condition of the cooperative movement in Great Britain was discussed. There are three types of co-partnership in existence: (1) Cooperation for manufacturing production; (2) for consumption by means of federated leagues of consumers; and (3) agricultural co-operation. The first preponderates in England, the second in Scotland, and the third in Ireland. From 1893 to 1899 in England there was an increase of nearly 37 per cent. in the number of societies and over 100 per cent. in the amount of bonus paid to employees as a dividend on their wages. The growth in trade, capital and profits is equally remarkable. Capitalization of the workers profits up to a certain amount is required. A provident fund of 10 per cent. of net profits is generally maintained. In Scotland the development of cooperation is almost wholly in the two great federations of consumers' societies, the Scottish Wholesale Society, and the United Banking Society of Glasgow. In Ireland, the membership of the co-partnership societies is about 60,000, most of the members being small peasant farmers. But few of these have as yet become shareholders. The development of cooperation in Great Britain has resulted in better wages, shorter hours, and more regular work than under competitive conditions and in addition, in many places 6 per cent. on their wages as dividends. There is a tendency on the part of the British productive societies to seek the open market and to depend less upon the custom of the cooperative stores.

COPPER. The production of copper in the United States in 1900 amounted to 606,117,166 pounds valued at \$98,494,039, as against 568,666,921 pounds, valued at

\$101,222,712 in 1899. Of the former product, Montana produced 39.6 per cent., Michigan 25.9, and Arizona 23.4, the remainder coming from about 14 other States. The exports of fine copper in 1900 amounted to 160,082 long tons, as against 119,811 long tons in 1899, while the total value of the imports, which were mostly manufactured articles, amounted to \$10,318,944 in 1900, as compared with \$10,128,862 in 1899. The production of 1901 will probably show a slight decrease, this being specially due to Montana, where some of the larger mines were inactive on account of litigation or repairs. There was also a falling off in the production of Arizona, but the Lake Superior region on the other hand witnessed an increase. Some copper was mined during 1901 in Vermont, and there was also a reopening of the New Jersey copper mines. In the foreign countries the Chilean mines show a greatly increased output and it is very likely that a much larger production is to be looked for from Mexico in the near future. A. N. Winchell notes an interesting occurrence of the formation of certain copper minerals in smelters in which he finds that both bornite and chalcopyrite are formed artificially at the smelter of the Butte and Boston Consolidated Mining Company at Butte, Mont. These substances were formed in the Allen O'Harra Calcining furnace along the rails in its bed, so that at the end of six months or a year very little iron was left in the rail and it had to be replaced by a new one. Both minerals have evidently been formed, he considers, by sublimation and not by fusion, for the temperature of the furnace is never high enough to melt the ores in it.

The following table from the United States Geological Survey gives the production of copper for 1900:

Source.	1900.	Maine, New Hampshire, Vermont, Tennessee, Southern States, and Middle States	
Lake Superior	145,461,408	Lead desilverizers, etc.	4,820,495 3,000,000
Arizona	118,317,764		
Montana	270,738,489		
New Mexico	4,169,400		
California	28,511,225		
Utah	18,354,726	Total domestic copper...	606,117,166
Colorado, including copper smelters (a)	7,826,949	From imported pyrites and ores and matte (b)	36,380,000
Wyoming	4,203,776		
Nevada	407,535	Total (including copper from imported pyrites).	642,497,166
Idaho	290,162		
South Dakota	15,147		

(a) Copper smelters in Colorado, purchasing argentiferous copper ores and mattes in the open market, source not known. The quantity of Montana matte which goes to one of these works has been deducted.

(b) Estimated.

COQUELIN, BENOÎT CONSTANT, the French actor, who, with Mme. Sarah Bernhardt (*q.v.*), toured the United States in 1901, was born at Boulogne-sur-Mer, January 23, 1841. He is the son of a baker and intended to follow that trade; but, showing a great fondness for the stage and a remarkable aptitude for acting, he went to Paris to enter the Conservatoire in 1859. Here he was one of the most brilliant of M. Regnier's students, winning a second prize in comedy, and he made his début at the Théâtre Français in 1860 as Gros-René in the *Dépit Amoureux*. M. Coquelin remained at the Français continuously until 1886, winning success in many diverse rôles, and in the latter year became a pensioner of the theatre. In 1889 he re-entered the Français, playing some of his former parts in support of his son. In 1891 he created the part of Labussière in Sardou's *Thermidor*, which was soon interdited by the government, and the next year he played Petruccio in a modified version of *The Taming of the Shrew*. At the Théâtre Porte Saint Martin in 1898 M. Coquelin brought out, with immediate success, Rostand's *Cyrano de Bergerac*, in which the combination of braggart, poet, and swordsman in the title rôle, gave full rein to his power. He has published, *L'Art et le Comédien* (1880); *Molière et le Misanthrope* (1881); *Un Poète du Foyer*, Eugène Manuel (1881); *Un Poète-philosophe*, Sully-Prudhomme (1882); *Les Comédiens par un Comédien* (1882); *L'Arnolphe de Molière* (1882); and *Tartuffe* (1884). M. Coquelin first visited the United States in 1889, and after his retirement from the Français in 1886 he undertook half-yearly tours in Europe and England, playing the rest of the time in Paris.

COREA, a constitutional monarchy of eastern Asia, occupying the peninsula between the Sea of Japan and the Yellow Sea. The capital is Seoul.

Area and Population.—The 13 provinces comprising Corea have an estimated area of 82,000 square miles and an estimated population of about 10,500,000. The foreign inhabitants number upwards of 20,000, of whom over four-fifths are Japanese.

Seoul has about 201,000 inhabitants, Ping-Yang 40,000, and Chemulpo 12,000. The prevailing language is intermediate between Japanese and Mongolo-Tartar. Aside from the worship of ancestors, religion has small place in the lives of the people.

Government and Finance.—The existing constitution was promulgated in August, 1899. The present monarch, Si Hi (or Yi Heui), who succeeded to the throne in 1864 and assumed the title of emperor on October 15, 1897, rules with the aid of a cabinet which has both executive and legislative power. Corruption has characterized the administration, but after the treaty of Shimonoseki in May, 1895, reforms were introduced through Japanese influence; there persists, however, a strong reactionary tendency. The independence of the Korean government is not regarded as a thing of permanence, since the country seems to be destined sooner or later to fall under the formal authority of either Russia or Japan. The most important item of revenue is the land tax. The estimated revenue and expenditure for 1899 were 6,473,222 yen and 6,471,132 yen respectively. The yen is worth 49.8 cents.

Industries and Commerce.—Agriculture, though in primitive condition, is the principal industry and rice the leading product. The country's mineral resources, however, give much promise and gold for some time has been an important export. Besides rice, the important crops include leans, ginseng, wheat, barley, millet, and oats. In view of the possible scarcity of food, the government forbade the exportation of rice, the prohibition taking effect on August 23, 1901. As rice is the chief article of export, it was thought that the foreign trade would suffer during the ensuing year. Formerly about 60 per cent. of the imports were British and about 30 per cent. Chinese and Japanese; but of late Japanese trade has been increasing. Besides importing large amounts of cotton goods, the Japanese control the entire ginseng crop, which is one of the principal Korean exports. They have nine-tenths of the shipping and virtually monopolize the Ping-Yang coal fields. The total trade of Corea, foreign and coast, was reported to amount in 1898 to 24,702,237 yen; in 1899, 22,074,669 yen; in 1900, 27,490,388 yen. In the last named year the net imports were valued at 13,355,272 yen (\$6,650,926), and the net exports, 9,439,867 yen (\$4,701,054). The last figure includes a declared export of gold valued at 3,633,050 yen (\$1,809,239). The actual gold export, however, appears to exceed this, the amount stated for 1900 being 4,101,260 yen (\$2,043,427); in 1899, 3,184,653 yen (\$1,585,957); in 1898, 2,391,452 yen (\$1,190,943). The net imports for 1900 were classified as follows: Cotton goods, 5,497,970 yen; foreign sundries, 4,958,746 yen; native sundries, 2,414,813 yen; metals, 421,581 yen; woollen goods, 54,228 yen; miscellaneous piece goods, 7,933 yen. Among the sundries the following were leading items: American kerosene, 1,797,630 yen; Japanese kerosene, 222,730 yen (other kinds amounted to only 18,748 yen, making the total kerosene import 2,039,108 yen); matches, 481,354 yen; mining supplies, 317,686 yen; bags, etc., for packing, 284,902 yen; railway supplies, 182,806 yen; provisions, 132,047 yen. The chief exports in 1900, besides the gold mentioned above, were: Rice, 1,145,805 yen; beans, 946,358 yen; fish, 60,533 yen; ginseng, 60,310; wheat, 55,876 yen; and hides, 22,890 yen. The actual value of American imports, except kerosene, is not accurately known, since foreign goods reach Corea chiefly through Japan and Shanghai, but for 1900 their estimated value was about 2,373,000 yen (\$1,182,000).

Communications.—The only railway in Corea is between Seoul and the port of Chemulpo, 26 miles; it was constructed by an American, but is now owned and operated by a Japanese syndicate. At Seoul is an electric tramway (10 miles), built and operated by Americans. A concession to build a railway from Seoul to Fusan, on the southeastern coast, was granted to a Japanese syndicate in September, 1898. The projected line was backed by an interest guaranty by the Japanese government. In the fall of 1901 the Japanese syndicate was amalgamated with a Belgian company. The survey for the railway was being made in the summer of 1901, and on August 20, construction was begun at Yong-Gong-Po, across the river from Seoul. It was expected that the road would be completed in six years. The road will be standard gauge, 287 miles long, and the estimated cost of construction is 25,000,000 yen. The total length of bridges on the line will be 20,500 feet, and the tunnels, 31 in number, will aggregate 40,700 feet. There seems to be some doubt as to whether the road will be a paying investment, but in any event it will strengthen Japanese influence in Corea. In 1901 a French company contracted with the government to build a railway from Seoul to Wi-ju, about 350 miles distant on the northern frontier, and during the summer the route was under survey. The construction of this road will be very difficult, since the country is mountainous and many rivers, as well as much quicksand, it is said, must be crossed. (See paragraphs on History.) The Korean foreign post-office has been in operation since January, 1900. There is telegraphic communication between Fusan and Seoul, and the latter city and Chemulpo, whence a cable extends to Nagasaki, Japan. There are also telegraph lines between Seoul and Wi-ju, connecting there with the Chinese system, and between Seoul and Wonsan (Yuen-san).

HISTORY.

Quelpart.—About the last of May, 1901, a rebellion broke out in the island of Quelpart, lying off the southern coast of Corea. The disturbances, though in part directed against the government, were essentially of an anti-Christian character. The government, it appears, increased the taxes and appointed a number of native Catholic Christians as collectors, whereupon the outbreaks took place. It seems that attacks were made by both Christian and non-Christian natives and several hundred people were killed. At the appearance of French war vessels in June the disturbances came to an end. Considerable blame for the troubles is attributed to the French Catholics in Quelpart.

The Customs Commissioner.—In March, 1901, the government dismissed the commissioner of customs and controller of finance, Mr. John McLeavy Brown, a British subject. Russian influence was suspected, but the Russian authorities asserted that the dismissal was in no way due to their influence. In April, upon the protest of the British minister, the order of dismissal was withdrawn; the question was revived, however, in May, when Mr. Brown again was ordered to relinquish his control of the customs, but about the first of July he was "restored to the capricious favor of the weakling emperor."

The Northern Railway.—Some apprehension of unwarranted Russian influence was felt in April, 1901, when it was announced that the Korean government had decided to contract with a French syndicate a $5\frac{1}{2}$ per cent. loan of 5,000,000 yen (\$2,490,000) for the purpose of beginning the construction of the projected railway from Seoul to Wi-ju, 350 miles distant. Interest was to be guaranteed by a lien on Korean mines. The terms of the agreement, however, were preliminary and in some quarters were considered impracticable. It was even stated that the Koreans did not wish to build the railway, but preferred to use the loan for gold and silver coinage and for the exploitation of the coal fields of Ping-Yang. Japan maintained that the loan would violate the convention of 1896, "whereby Russia and Japan agreed that, should Corea require a foreign loan, both would lend assistance by common accord." M. Pavloff, the Russian minister to Corea, stated that he did not look upon the loan with favor, since so small a sum was liable to be dissipated in bribes and official overreaching. He added that, in order "to accomplish anything," Corea "must borrow largely."

Russia and Ching-Kai.—In the spring of 1901 it was reported that Russia was attempting to acquire Ching-Kai (also written Chin-hai and Shin-hai), a bay in the extreme south of the peninsula midway between Vladivostok and Port Arthur.

It will be remembered that in 1900 Japan entered strenuous protests against Russia's proposal to acquire for a naval station a harbor about 20 miles from the treaty port Masampho, which is separated from Japan by the Corea strait. Russia did not secure the coveted station, but was forced to be content with a coaling station for the Russian Steamship Company within the bounds of the foreign settlement of Masampho. In the spring of 1901 the Japanese press indicated that a similar protest would be made by the government against any expression of Russia's desire to acquire Ching-Kai. The "lease" of Ching-Kai as a naval station would materially strengthen Russian sea power in the Far East, and accordingly would be prejudicial to the peace of Japan. It appeared also that Great Britain had reason to object to Russia's acquisition of the bay; since the former power, when Corea was still regarded as being under the suzerainty of China, gave up possession of Port Hamilton—only 75 miles distant from Ching-Kai—in virtue of a Russo-Chinese agreement that Russia should not seek to acquire territory in Corea. Later it transpired that, while Great Britain looked upon the agreement as permanent, the signatory powers admitted a private stipulation that it should stand for only ten years. And Russia, moreover, pointed out that Great Britain was not a party to the agreement.

Japan at Chapokpo.—In November, 1901, it was announced that the Korean government had allotted to Japan 650 acres at Chapokpo, near Masampho, for a special settlement policed by Japan. Russia was formerly anxious to secure this land, which had been surveyed by a Russian warship. This concession, within the treaty-port limits, balanced the concession at Masampho already made to Russia (1900).

Russia and Japan.—Corea is regarded as an object of almost certain contention between Russia and Japan. The latter country needs it as an outlet for her congested population; Japan, indeed, believes the possession of Corea to be essential to her economic and political success. Russia, on the other hand, determined to retain that for which she has so long striven—an outlet in the Liao-tung peninsula—would regard, and probably with justice, the Japanese possession of Corea as a serious menace to her interests. The feeling is general that Russia will be successful, though at present Japan is stronger on the sea and, according to a Japanese authority, can at short notice send into Corea military forces superior to Russia's. This, of course, is doubtful. But the influence of the Japanese seems to be gaining strength. They are not only maintaining their position in Corea, but are increasing in number

throughout the peninsula. They watch every movement of Russia, while that government recognizing the Japanese power, "acts with studied conciliation, ostentatiously communicating to the Japanese legation the movements of Russian troops in Manchuria, especially if they be on the Korean frontier."

CORN.—The corn crop was the crop disaster of the year 1901. It was the nearest approach to a corn failure the country has ever known. The United States Department of Agriculture has given out no fixed figures for the total crop, but the statistician in his preliminary estimates places it at nearly or quite 700,000,000 bushels below the average; and the *American Agriculturist's* preliminary estimate is 1,500,000,000 bushels, in comparison with 2,105,102,516 bushels in 1900. The spring of 1901 was quite unfavorable for the corn crop, being cold and wet throughout the corn belt, delaying plowing and planting, and making germination slow and uneven. A month or six weeks of cold weather followed in most sections, checking the growth and stunting the plant. As a consequence, the crop was backward and the stand inferior, when the hot weather and drought of the latter part of June and July caught it. The continued hot winds and lack of rain lasted until the close of July, and when the drought ceased the damage was permanent over a great range of the corn belt. The period of high temperature and hot winds was coincident with the appearance of the tassel, and prevented the formation of ears, though the stalks revived and grew after rain came. This caused the earlier estimates to be too high. The rain saved the corn that was planted late, for that remained at a standstill during the drought; and the month of September was generally quite favorable to finishing the crop. A considerable acreage in Illinois, Iowa, Missouri, Kansas, and Nebraska was either abandoned, cut for feeding, or pastured.

The preliminary estimates of the United States Department of Agriculture, issued in November, for the average yield per acre by States, which are the only data issued by the department, together with the estimate of the *American Agriculturist* for the acreage planted in corn and the yield by States, are as follows:

STATES.	AVERAGE YIELD PER ACRE.		Average Quality.	Estimated Acreage. (Am. Agri- culturist.)	Yield by States. (Am. Agri- culturist.)

a.—Seven years. b.—Six years. c.—Nine years.

The average yield of corn for the United States is given as 16.4 bushels per acre, as compared with an average yield of 25.3 bushels per acre in 1899 and 1900, and a ten-year average of 24.4 bushels. This is the lowest yield per acre ever recorded for the corn crop. In all of the 23 States having one million acres or over of corn, except Pennsylvania, Virginia, and Michigan, the average yield was below their ten-year averages. The quality averaged only 73.7 per cent., as compared with 85.5 per cent. in 1900 and 87.2 per cent. in 1899. The total area planted, according to the *American Agriculturist*, was 87,050,000 acres, as compared with its estimate of 86,276,000 acres the preceding year; and the total yield estimated by that journal November 16, was 1,418,849,000 bushels. The price of corn per bushel, which is regulated by the production in the United States rather than by the world's crop, has been more than twice what it was in 1896, the last year of the agricultural depression, so that despite the small crop, its total value is estimated at \$720,000,000, or about \$232,000,000 more than the 50 per cent. larger crop of 1896. The price of No. 2 corn during the winter ranged from 56 to 74 cents a bushel.

The Department of Agriculture has published no summary of the world's corn crop for 1900. Ordinarily the United States produces about four-fifths of the total crop of the world, Austria-Hungary ranking second and Mexico third. The Hungarian minister of agriculture estimated the world's crop of 1900 at from 2,778,000,000 to 2,815,000,000 bushels. The returns for 1899 showed 2,735,090,000 bushels, of which 2,078,144,000 bushels were produced in the United States and 110,000,000 bushels in Mexico. The crop in Austria in 1900 was 15,446,134 bushels, from an area of 829,270 acres; in Russia 34,256,460 bushels, and in Italy 86,266,080 bushels. The 1901 crop of the latter country is estimated at 86,068,700 bushels, which is very close to the average for that country, and that of Ontario, Canada, at 24,838,105 imperial bushels of corn on the ear. Reports from Austria in October were to the effect that the corn crop had not in general quite come up to expectations, but was for the most part satisfactory. In Hungary the yield was satisfactory in the greater part of the country, the quality being good and in some places excellent. An effort is being made in Russia to increase the growing of corn and to extend it to the north of its present limits. At present the crop is confined to quite limited districts in southern Russia, the total area in corn in 1900 being only 3,268,473 acres. The Russian government has lately taken the matter up, the Ministry of Finance, in a recent official publication, urging an increase in the cultivation of corn as a means of minimizing the adverse effects of the increased German tariff on cereals, the exports of corn being chiefly to other countries than Germany. The exports of corn from the United States during the fiscal year ended June 30, 1901, as compiled by F. H. Hitchcock, chief of the section of foreign markets, United States Department of Agriculture, together with the figures for the preceding year, are as follows:

EXPORTS OF INDIAN CORN FROM THE UNITED STATES.

Countries to which exported.	Year ended June 30.			
	1900.		1901.	
	Bushels.	Value.	Bushels.	Value.
United Kingdom	85,318,727	\$34,993,528	79,844,843	\$37,282,851
Germany	46,256,978	18,776,736	36,992,634	17,305,229
Netherlands	23,584,536	9,556,637	17,647,894	8,111,664
Denmark	18,863,505	7,509,637	11,189,798	5,049,492
Belgium	9,618,054	3,974,552	10,002,294	4,740,607
Canada	12,043,574	4,584,059	10,642,863	4,560,393
France	5,297,212	2,103,572	4,458,029	1,950,546
Other countries	8,365,638	3,707,679	7,039,610	3,527,201
Total	209,348,284	\$85,206,400	177,817,965	\$82,527,983

In the field of experimentation on this staple crop there has been quite the usual amount of activity. Irrigation experiments on corn in Wisconsin gave remarkably striking results, showing the great benefit of even small amounts of irrigation water. The yield with irrigation was 65 bushels of ear corn per acre, and without, only 30 bushels. The season, however, was very favorable for showing the effect of irrigation. The breeding experiments have given several varieties of promise, especially for the northern corn-growing regions, North Dakota and Minnesota; and by selection with reference to maturity and hardness the corn belt is being pushed farther north year by year. The possibility of increasing the protein content of corn by selection on a purely mechanical basis has been demonstrated, and is now being undertaken on a commercial basis in Illinois by growers of seed corn. A variety or strain richer in protein is extremely desirable, but doubt has been expressed whether this quality could be permanently fixed and transmitted, or whether the selection would not be necessary every year. Recent experiments have confirmed the previous

findings of the practically uniform productiveness of the seed from the middle, butt and tips of the ears. The cost of growing corn in recent years has been carefully estimated by a number of experiment stations. In Arkansas a crop of 30.8 bushels per acre was found to cost $22\frac{1}{4}$ cents per bushel. In Illinois the cost under the average conditions of the State was 19.5 cents per bushel, and in Nebraska the cost on two different fields was at the rate of 14.9 and 23.4 cents per bushel respectively. Probably the most important result of the year relates to silage—or the preservation of the whole corn plant in silos. The changes in composition and the heating which silage undergoes had been supposed to be due to bacterial action; but Babcock and Russell in a recent investigation have shown that bacteria or microorganisms are in no way essential to silage production, and although ordinarily present are undesirable and a source of loss through the decomposition of organic matter which they cause. The initial heating of silage is explained as due mainly to the intramolecular respiration of the cut and bruised tissues of the plant, which also accounts for the evolution of carbonic acid gas. As silage with typical flavor and aroma was made under conditions in which all vital processes are suspended, it is suggested that enzymes are operative in this connection. The work has emphasized the advantages of thoroughly constructed silos, and close packing of the corn, to exclude the air as far as possible and so reduce the losses. Increased value is being attached to the corn stores or stalks from which the ears have been picked, both as a feed and for manufacturing purposes. For several years the pith from these stalks has been used in the arts, principally as a packing in battle ships, and the past year several factories have paid farmers as high as \$3.50 a ton for the stalks. Quite recently practical trials have demonstrated the value of the fibre of the stalks for paper making, and patents have been issued. The shell or shive of the stalk, as well as the pith, is found to be an entirely satisfactory and cheap paper stock. These materials give an unusually tough and pliable product, and appear to be suited to making a great variety of grades. Good board, superior to straw board, can be made at less cost, it is said, than from straw. In view of the bounteous supply of corn stalks, renewed every year, and the present search for suitable paper stock, the discovery seems to be one of much promise; and it seems likely that the despised corn stalk, now largely wasted in many sections, may become a material source of profit, as well as the grain.

CORNELL UNIVERSITY, Ithaca, N. Y., founded 1868, with the Medical College located since 1900 in New York City. The teaching staff for 1900-01 was 324, consisting of 94 professors and 134 instructors and assistants at Ithaca, and 30 professors and 66 instructors and assistants in the Medical College. The student-body, including 237 medical students in New York City, numbered 2,080, of whom 205 were in the graduate department, 755 in the undergraduate college of arts and sciences, and the remainder in the three professional and six technical schools. This also includes the 424 students attending the summer session. This is an increase of more than 200 over the attendance for the previous year. During the year, 11,500 volumes and 2,000 pamphlets were added to the library, which now numbers upwards of 250,000 volumes and 40,000 pamphlets. The life of the University during the year was marked by no events of especial importance. In order to exercise an efficient control over the rapidly increasing body of students, all authority in matters of discipline was centred in the general university faculty, instead of being divided as hitherto to the several special faculties. The president recommends that the university faculty delegate this authority to a committee on student conduct, which shall consist of the dean and secretary of the university faculty, the deans and secretaries of the four largest special faculties, to be joined in every case by the dean and secretary of the special faculty to which the offending student belongs. During the year there was a general demand on the part of the students, which was seconded by the members of the faculty, for an abandonment of the honor system of examination and a return to the old proctor system. During the year considerable discussion was aroused throughout the State concerning the policy of the College of Forestry, in whose charge had been given a large section of the Adirondack forests. The policy of the school had been to cause a removal of the old forest in about fifteen or twenty years, meanwhile replacing it by a new growth of better composition and promise partly through natural regeneration and partly by artificial reforestation. However, the curtailment of the funds received from the legislative grant from the \$50,000 recommended to \$30,000, necessitated the concentration of logging operations so that some 500 acres were denuded while only about 75 acres were planted during the year. More ample funds and time, it is hoped, will remove the cause of public criticism from this Cornell school which, during the past year, sent out the first graduates in forestry in America. During the year two new buildings were begun: Stimson Hall, for the medical department at Ithaca, and the central dome-crowned portion of Sibley College. While the productive funds of the University amount to about \$7,000,000, and the total property at almost \$11,000,000, yet with an annual increase of 200 students the president indicates a great need for

funds and for at least ten new buildings. To meet this need, Mr. John D. Rockefeller has agreed to give \$250,000 on condition of subscriptions of an equal amount by the 1902 commencement. The University authorities are now engaged in what promises to be a successful effort to meet these requirements. See **PSYCHOLOGY, EXPERIMENTAL**.

CORNU, MAXIME, French agriculturist, died April 5, 1901. He was born July 16, 1843, at Orleans, and was educated at the Ecole Normale Supérieure, where he specialized in the study of botany. After serving as assistant to Duchartre at the Sorbonne, he became attached to the staff of the Museum of Natural History under Brogniart, paying particular attention to mycology and plant pathology. He discovered the *Phylloxera vastatrix*, a disease which in 1868 was devastating many French vineyards, and served as secretary of a government commission appointed to investigate the subject. He was soon recognized as the leading authority in this specialty, and his opinions were sought from many countries of the world. In 1884 he was appointed professor of culture at the Museum and there devoted himself to agricultural experiments and researches, with particular reference to the industrial needs of the French colonies.

CORPORATIONS. See **FINANCIAL REVIEW, STRIKES, TRUSTS, and UNITED STATES STEEL CORPORATION.**

COSTA RICA, a Central American republic and the most southern country of the North American continent. The capital is San José.

Area, Population, etc.—The area of the five provinces and two territories comprising Costa Rica has been estimated at 23,000 square miles. The settlement of the boundary dispute with Colombia through the arbitration of the president of the French republic, September 12, 1900, was not satisfactory to Costa Rica. Although the southern part of the new boundary met with little criticism, President Yglesias, in his congressional message, May 1, 1901, spoke of the decision as one that had "blasted the hopes of the government and shocked in like manner the whole country." The estimated population in 1899 was 310,000. Roman Catholicism is the state religion. Public primary education is free and, unlike that in most of the Latin-American countries, actually compulsory.

Government.—The chief executive is a president, who is elected for a term of four years, and is assisted by a cabinet; the president in 1901 was Rafael Yglesias, who was reelected in November, 1897. The legislative power devolves upon the chamber of representatives. The regular army and navy are inconsiderable.

Finance.—The monetary standard is gold and the unit of value (since July 15, 1900) is the colon, worth 46.5 cents in United States money. Customs and excise constitute the chief sources of revenue. The revenue and expenditure in pesos (the average value of which was about 3 cents less than that of the present colon) were 8,413,198 and 8,069,748 respectively for the fiscal year 1899, and 8,225,142 and 7,444,970 for 1900. For the fiscal year 1901 the revenue was reported at 8,700,833 colones. The foreign debt, amortization of which will begin in 1917, amounted to £2,085,000 (\$10,150,652) in 1900. The internal debt in 1899 was 2,922,221 pesos.

Industries, Commerce, etc.—The cultivation of coffee and bananas is the leading industry and stock-raising is important. The total imports and exports for the fiscal year 1899 (in gold pesos valued approximately at one dollar in United States money) were 4,136,707 and 4,929,955 respectively; for 1900, imports 6,084,898, and exports 6,321,196. Included in the imports of the latter year was coined gold to the value of 977,105 pesos. The percentages of the imports of merchandise by countries for 1899 and 1900 respectively are: The United States, 54 and 46.20; Great Britain, 19.60 and 27.30; Germany, 14.55 and 13.59; France, 5.90 and 5.94. The leading imports are cotton and other textiles and iron and steel ware. The chief export is coffee, bananas ranking next; the export of cabinet and dye woods and hides and skins is important. The coffee export increased from 23,129,000 pounds in 1894 to 43,153,000 pounds in 1898, and fell in 1899 to 33,807,000 pounds; this was valued at \$2,866,000, of which 55 per cent. represented exports to Great Britain, 26 per cent. to the United States, and 15 per cent. to Germany. The coffee exported in the fiscal year 1900 amounted to 35,756,218 pounds (16,218,954 kilogrammes) valued at \$3,800,188. The banana export has grown from 3,500 bunches in 1881 to 3,420,166 bunches, valued at \$1,354,386 in the fiscal year 1900. Financial and economic conditions in Costa Rica were unfavorable in 1901, owing largely to the depreciation of coffee. This situation, however, was regarded as temporary; Costa Rican coffee, which is unexcelled by that of any other American country, is gaining favor in the United States. On September 1, 1901, a law abolishing the export duty on coffee became operative. According to a government decree import duties were increased 50 per cent. on April 28, 1901. There are somewhat over 150 miles of railway open to traffic and railway construction is in progress.

COTTON. The cotton industry in the United States during the year 1901 was marked by continued prosperity, which has extended from the producer to the

manufacturer, though in certain branches of the textile trade conditions were not so good as might be desired. Discussing first the production of cotton, it is necessary to consider previous crops in order to realize the conditions at the beginning of the year. Census Bulletin No. 98 of the Twelfth Census (September 28, 1901), gives statistics for the cotton crop in the United States for 1900. The production in bales (of 500 pounds) is given as follows: Alabama, 1,061,678; Arkansas, 828,820; Florida, 55,696; Georgia, 1,270,597; Indian Territory, 288,114; Kansas, 151; Kentucky, 133; Louisiana, 714,073; Mississippi, 1,055,968; Missouri, 27,980; North Carolina, 509,341; Oklahoma, 116,875; South Carolina, 780,782; Tennessee, 227,601; Texas, 3,536,506; Virginia, 11,833. Thus the crop in 1900 amounted to 10,486,148 bales, as compared with 9,450,000 bales in 1899, and the record crop of 11,270,000 bales raised in 1898. In 1899 there was a short crop not only in America but in Egypt and India, so that when the American crop of 1900 was marketed it brought the highest price that cotton had touched for ten years (12.75 cents January 28, 1901, at New York). With the profits of an excellent season to encourage them, the southern planters early in 1901 made preparations for an active season. With abundant capital, resulting from the successful marketing of the crop of the previous year, extensive purchases of fertilizers were made, and a largely increased acreage was planted. Everywhere possible cotton was planted, and a total of 27,532,000 acres under cultivation was reported to the government—an increase of some 2,000,000, or about 8 per cent. over the acreage of 1900, and about 3,000,000 acres over the usual average acreage. Under such conditions it was evident that the high prices of the early part of the year could not be maintained, and the price steadily fell, until May 13, when middling upland cotton sold at New York for 8 1-16 cents. Soon, however, various weather and other conditions began to make themselves felt, and the late spring and heavy rains of the early summer gave a new aspect to the situation, and put the price higher. On account of these facts and the droughts of August and September in Texas, the average condition of the crop, which was stated at 82 per cent. of perfect on June 1, fell successively month by month, until on October 1 it was announced as 61.4 per cent., or, with a single exception, the lowest on record in over thirty years, the lowest year referred to being 1896, when but 7,100,000 bales were produced. Successive estimates put lower figures on the production, which was variously given at from 11,200,000 to 10,250,000 bales. On December 3, considerable excitement was produced when the Department of Agriculture submitted its final estimate of 9,674,000 bales, but the estimate was considered too low by many authorities, who added from half a million to a million bales to these figures. The tendency naturally was to put the price up, so that at the close of 1901 cotton sold in New York for 8 7-16 cents, as compared with 7 13-16 cents on November 6. India, Egypt, and central Russia were said to have good crops at the close of the year, but as the larger part of the world's production comes from the United States the interest centres in the crops of the South.

The consumption of cotton, however, is not so largely confined to the United States as is its production. Of the 12,141,000 bales, which represented the world's production for the season 1900-01, on September 1, 1901, there remained a visible supply of 1,569,000 bales, while in the hands of the spinners there was an invisible supply of 1,042,000 bales. Of the total production Great Britain took 3,368,000 bales and Continental Europe 4,576,000, while in the United States the spinners used 3,727,000 bales. Of this last amount, 2,150,000 bales were consumed by northern spinners, and 1,557,000 by southern factories. When it is recalled that in 1890 the southern mills consumed only about 613,000 bales, as compared with about 2,000,000 taken by northern mills, the growth of the home consumption and industrial progress in the South is apparent. It may also be added that with the low price of labor in the South, these mills are making substantial profits, and that a considerable amount of the coarser cottons once made by the northern spinners is now woven in the South.

On September 1, 1901, the number of spindles in the world was estimated at 108,069,835, of which number 20,869,835 were credited to the United States, 46,400,000 to Great Britain, 33,000,000 to Continental Europe, 6,700,000 to the East Indies, Japan, and China, 640,000 to Canada, and 460,000 to Mexico. Throughout the world there has been a substantial yearly increase in the number of spindles, as is shown by the following comparative figures: 1897, 99,093,526; 1898, 100,884,679; 1899, 103,675,847; 1900, 105,130,515; 1901, 108,069,835. Considering the increase in spindles in the United States alone, the following figures are of interest and again emphasize the increasing ability of the southern mills to take care of a product peculiarly their own. The figures cover the past three years ending August 31, 1901:

Spindles.	1900-01.	1899-1900.	1898-99.
North	15,050,000	14,590,000	13,950,000
South	5,819,835	4,540,515	3,987,735
	<hr/> 20,869,835	<hr/> 19,130,515	<hr/> 17,937,735

This statement shows that the season of 1900-01 witnessed the greatest increase on record of spindles in southern mills. The mills themselves have also increased in number, but not so rapidly as in the previous year. The large gain in spindles is due to the equipment of the mills then under construction. Among the new mills in the South there are a number devoted to fine yarn goods, an industry that is increasing in prominence.

In distinction to the year 1900, the year 1901 was generally satisfactory to the manufacturers and dealers in cotton goods. The chief reason was that the markets of China, closed on account of the Boxer uprising, were again thrown open, and there have been large exports for this trade. The decline in the exports to China, caused by the outbreak, is shown in the following statement of exports for the past three fiscal years ending June 30:

	1900-1901.		1899-1900.		1898-1899.	
	Yards.	Value.	Yards.	Value.	Yards.	Value.
Colored goods.....	115,949,219	\$ 6,534,225	87,880,515	\$ 4,839,491	108,940,972	\$ 5,221,278
Uncolored goods.....	135,564,132	7,851,812	264,314,474	13,229,443	303,063,083	13,748,619
Total cotton manufactures exported.....	251,503,351	\$14,386,037	352,194,989	\$18,068,934	412,004,055	\$18,969,897

During the year 1901, however, conditions changed and there were large shipments to China, which normally takes about one-half of the exports of cotton goods sent out from the United States. At the close of the year figures were available for the ten months ending October 31 and are given below in a series of tables, while for purposes of comparison figures for similar periods in 1900 are given. The total exports in these ten months were:

	Yards.	
	1901.	1900.
Colored Goods.....	109,805,798	71,618,468
Uncolored Goods.....	203,665,190	158,165,215
Totals	313,470,988	229,783,683

The interesting question is, to what countries are these exports shipped? This is indicated in the two following tables, the first showing the countries where the exports for ten months in 1901 increased over those in 1900, while the second table shows those countries where there has been a decrease:

	Yards.	
	1901.	1900.
China	167,507,871	100,968,632
Africa	6,204,175	3,727,723
United Kingdom.....	7,875,643	4,878,403
Santo Domingo	4,154,890	2,763,758
Cuba	3,984,194	2,430,077
Colombia	19,508,778	3,599,263
Oceanica	28,500,328	18,757,252

	Yards.	
	1901.	1900.
Central America	10,215,946	12,016,305
Mexico	3,229,823	4,298,643
Sundry West Indies.....	14,730,253	18,071,015
Sundry South America.....	21,177,177	26,239,504
British East Indies.....	5,884,674	10,017,286

As regards the domestic trade in cotton goods, the year 1901 was considered generally satisfactory. Printed calicoes do not enjoy the sale that they once did, and there was less demand in 1901 than previously. Other printed fabrics, however, have met with good sales, and there have been substantial profits to the manufacturers. The mills in Fall River, Mass., where there are usually various labor troubles or other vicissitudes to be recorded, did not enjoy as successful a year as in 1900, since for a part of the time print cloths sold for less than the cost of manufacture. An average dividend of 5.37 per cent. on a capital stock of \$21,301,000 was paid—a rate which is more than 2 per cent. less than that of the previous year, and about .75 per cent. less than the average for thirteen years.

COTTON, General FREDERICK CONYERS, English military engineer, died in London, October 12, 1901. He was born in England in 1807, and entered the army, in the Madras engineers, at an early age. After serving for some time in the Public Works Department he was employed in the first China War as assistant, and later as commanding engineer. It was for distinguished services in this war that he was brevetted major-general. For several years he was associated with his brother, Sir Arthur Cotton, on the India irrigation works on the Godavari. He retired from active service in 1860.

CREIGHTON, Rt. Rev. MANDELL, Anglican bishop of London, died in London, January 14, 1901. He was born at Carlisle, Northumberland, July 5, 1843, and was educated at Durham Grammar School and Merton College, Oxford, graduating with the highest honors in 1886. At graduation he was elected a fellow of his college and remained at Oxford as tutor until 1875. During this time he took the orders of deacon, 1870, and priest, 1873, and in 1875 assumed a vicarage, the college living at Embleton in his native shire. This he left in 1884 to reenter academic life as occupant of the Dixie chair of ecclesiastical history established at Emmanuel College, Cambridge, in that year. In 1891 he became Bishop of Peterborough and continued there until translated to the see of London in 1897, in which year he became, ex-officio, a privy councillor. Dr Creighton represented Emmanuel College at the 250th anniversary of the founding of Harvard University in 1886, and the Church of England at the coronation of Czar Nicholas II. in 1896. As bishop of London he had to confront many delicate questions relating to the form of the church service, the disposition of which was a distinctive commentary on his discretion and impartiality, in view of his widely known sympathy with High Church principles. As an historian, Bishop Creighton ranked high. His chief works are *History of the Papacy* (5 vols., 1882-94), an authority on the subject; *Age of Elizabeth* (1876); and *Cardinal Wolsey* (1888). He was also the founder and first editor (1886-91) of the *English Historical Review*.

CREMATION OF THE DEAD. In January, 1901, the first municipally owned crematory in Great Britain was opened at Hull, England. The crematory is described as a brick building comprising a hall or chapel 24 feet square, a second room containing the incinerating chamber, and a tower 70 feet high. The cremating apparatus is a furnace of the regenerative type, designed by the late Henry Simon, president of the Manchester Crematorium Society. It consists of three interior chambers, the two lower of which are surrounded by air passages. The lower chamber contains a coke fire, and the upper one is that in which the cremation takes place. The fire is lighted some hours before the apparatus is used, and is supplied with air in the usual way. By the time the apparatus is ready for use the walls of the air passages are thoroughly heated. Most of the direct air supply is then cut off, and the partially consumed gas (carbonic oxide) from the coke is allowed to mix in the second chamber with the air heated by passing through the side air-passages. The incinerating chamber is thus filled with gas of an intensely oxidizing character in a state of incandescence. The degree of heat can be regulated in the most exact manner. There is no smoke and little visible flame before the body is introduced, and if the coffin is made in accordance with the regulations, there is no smoke and no noise during the cremation. The process occupies about one hour, at the end of which, there remain only the inorganic bases of the bones, in the form of silvery gray, pumice-like fragments. These remains are placed in an urn. The interior of the cremating chamber is at no time visible to the mourners. When the committal sentence in the religious service is read, the coffin passes noiselessly by means of invisible mechanical arrangements, through curtains, into an intermediate chamber, and the curtain falls behind the coffin as it enters the cremating chamber. The charge for cremating the bodies of residents within the city is £1 1s., or a little over \$5; for non-residents, it is £3 3s. The mayor, in his address at the opening of the crematory, spoke of the urgent need of the general adoption of this method of disposal. He said that when one realized that at least 500,000 people died in one year in the United Kingdom, they would at once see how the disposal of the dead might be a serious menace to the health of those who live in the large cities and towns. Several other English cities have obtained authority from Parliament to construct crematories.

The first legal recognition of cremation in the Dominion of Canada was obtained by its advocates in 1901, when a bill was passed, after a close vote, by the Quebec legislature, granting powers to the authorities of the Mount Royal Cemetery to construct and operate a crematory. Determined opposition was made by the Roman Catholic members of the legislature, and after their defeat the Archbishop of Montreal issued a pastoral letter, in which he condemned cremation strongly, and stated that it is prohibited for all adherents of the Church.

In the United States, during 1901, one additional crematory was completed—that at Portland, Ore. There are now twenty-six crematories in the United States and one

at Montreal, Canada. All are owned and operated by private corporations. A cremation congress was called to meet at Buffalo during the Pan-American Exposition, but was adjourned on account of the assassination of President McKinley. During the autumn of 1901 a book entitled *A Quarter Century of Cremation in North America*, written by John Storer Cobb, the honorary president of the New England Cremation Society, was published for that organization. The book gives a history of the movement in America, and also contains a brief account of its advance in Europe. Statistical tables with summaries show the number of cremations that have been made in each crematory in both America and Europe. A very full bibliography is also included. The table relating to the United States is given herewith. The total number of cremations in Europe, at the close of 1900, were: Italy, 4,110; Denmark, 146; France, 2,245; Germany, 4,261; Great Britain, 2,482; Sweden, 721; Switzerland, 719; grand total, 14,684.

CRETE, a Mediterranean island constituting an autonomous state subject to the suzerainty of Turkey. The capital is Canea.

Area, Population, and Industries.—The total area is 3,326 square miles. The census of June 17, 1900, showed the population, exclusive of 6,096 foreigners, to be 301,273, of whom 267,266 were Greek, 33,281 Mohammedan, and 726 Jewish. Compared with the census of 1881, the Greek element showed an increase of 62,256, and the Mohammedan a decrease of 39,955. The Mohammedan population is chiefly in the three towns of Candia, Canea, and Retimo.

Agriculture, though the principal industry, is neglected. The chief product, olive oil, and soap are the leading exports. The total imports and exports in the fiscal year 1899 were valued at 12,351,105 drachmai (19.3 cents) and 6,600,198 drachmai respectively. The commerce is largely with Greece and Turkey.

Government and Finance.—Through the intervention of Great Britain, Russia, France, and Italy in 1898, Crete became an autonomous state under the nominal suzerainty of Turkey. Prince George, second son of the King of the Hellenes, was chosen high commissioner by the powers, and he has held the office since December 21, 1898. The constitution, adopted April 28, 1899, places the executive authority with the high commissioner, who is assisted by a council of five members (four Christian and one Mohammedan). The legislative power devolves upon an elective assembly, in which Mohammedan representation is assured; ten deputies are appointed by the high commissioner. Questions concerning foreign relations are determined by representatives of the four protecting powers at Rome.

Revenue is derived largely from direct taxes, and the principal expenditures are for internal administration. Import duties are forbidden. The estimated revenue and expenditure for the fiscal year ending August 31, 1900, balanced at 5,274,118 drachmai; for the fiscal year 1901, revenue, 6,263,195 drachmai, and expenditure, 6,994,255 drachmai; for the fiscal year 1902, revenue, 4,046,890 drachmai, and expenditure, 4,568,464 drachmai.

History.—The results of the elections to the legislative assembly at the end of

April, 1901, were: Opposition members, 54; government supporters, 6 (of whom, however, 3 were doubtful); Mussulmans, 3; while 10 other deputies were to be designated by Prince George. The assembly convened on May 31 and passed a censure upon the administration for extravagance, inefficiency, and particularly neglect of public works.

During 1901 anti-Mussulman influence in Crete was active for the annexation of the island to Greece. Late in February Prince George was informed that his proposals for such annexation and for the supersession of the international troops by Greek troops had been rejected by the protecting powers—Great Britain, France, Russia, and Italy. He reported his failure to the assembly upon its convening May 31, whereupon that body adopted a resolution requesting the powers "to put a crown on their noble and philanthropic work by granting union with Greece." The resolution was communicated by Prince George to the consuls, who, acting on instructions from their respective governments, returned the document to the Prince; while on June 18 the protecting powers, through the consuls, delivered to Prince George a declaration intimating their determination to maintain the *status quo*. The joint note pointed out that any infringement of the rights of the Sultan might not only arouse the Moslem inhabitants of Crete, but subject Greece again to the hostility of Turkey, while the existing arrangement, insuring simplicity of administration and exemption from heavy taxation, best tended, in the opinion of the powers, to the moral and material improvement of the inhabitants. Moreover, it was feared that annexation would open the "Balkan question," which "every European cabinet, including that of Greece," was "anxious to keep dormant." A conservative and apparently sound opinion, and one that was widely shared by the press, was thus stated in the London *Saturday Review*: "A change in the relations of Turkey to the Balkan states is certain, and circumstances, if not the action of the Sultan, must soon upset the present artificial balance. A feature of the reconstruction will probably be the incorporation of Crete with Greece, but the time is not yet. The Cretans have no immediate grievance, and the only hope for the peace of the future is that the intricacy of this arrangement and relation of the near eastern countries should be simplified slowly as the several difficulties arise."

In July, 1901, it was reported that Prince George and the chamber of deputies were at variance on several questions of administration. The Prince demanded the nomination of mayors by himself, while the deputies insisted that mayors should continue to be elected by popular vote. Through the vote of ten deputies appointed by the Prince, the chamber, by a majority of one, accorded the Prince the right of appointing the mayors. The government stated that the Prince's reason for wanting this power was his wish to obviate dissensions incident to local elections.

The high commissioner and the deputies were also at odds with regard to the press. The Prince held that in addition to his right to suppress publication, he had the right to press censorship; this position was opposed by the deputies, who kept well in mind the arbitrary measures taken against the liberty of the press by the Prince's secretary, M. Papadiamantopoulos. It was stated that the Prince would respond to a strong feeling in Crete if he would break from Greek influence and appoint an adviser from some disinterested nation, such as Switzerland, Holland, Belgium, or the United States.

Representatives of the four protecting powers decided on November 19, 1901, that Cretans sentenced in Turkey for political or common-law offenses should be transferred to Crete, and that the Cretan flag and Cretan passports should be recognized by the Ottoman government. See *ARCHÆOLOGY* (paragraph Crete).

CRETINISM. A congenital or infantile form of myxœdema, though loosely used to include cases of that disease beginning at eight to twelve years of age. In some cases of myxœdema, the functional activity of the thyroid gland is diminished by disease, and in others there is a formation of new tissue in the gland, forming a goitre. Cretinism is epidemic in valleys in the mountainous districts of Europe and Asia, and is sporadic in the British Isles, France, South Australia, and America. In the congenital form of the disease, the infant is stunted, the body swollen and sodden, the nose broad, flat and retroussé; the cheeks are baggy; the lips thick, the lower one being everted; the mouth is large, and the tongue, which is thick and broad, generally protrudes. The ears are large, the brow is narrow in front, while the posterior fontanelle remains open and the occiput is broad. The skin is dry and rough; the neck is short and thick. The abdomen is prominent and pendulous, and the spine is arched forward. The legs are short and thick. There is early mental arrest and the patient is an idiot. It was reported in 1901 that in the eastern part of France there were 32 cretins per thousand, and in the whole of France about 125,000 cretins and myxœdematous idiots. In Switzerland and in Austria the number is said to be as great as in France. In North America up to the present time less than 100 cases of sporadic cretinism have been reported. Treatment of the condition consists in graduated doses of thyroid gland.

CRICKET. In 1901 the United States was again visited by a British eleven, under the captaincy of B. J. T. Bosanquet, a player in former international matches here. They played at Philadelphia and New York and in Canada. The Englishmen tied in the games played at Philadelphia and won at New York and in Canada. The twenty-ninth annual match between the United States and Canada, at Toronto, September 9-10, was won by the Americans, for the nineteenth time. The Belmont Cricket Club of Philadelphia made a tour to Nova Scotia in August, and won the majority of the games played there. A Canadian team made an unsuccessful trip to Philadelphia and New York in June. The Halifax Cup, the most noted cricket trophy in America, was played for by the principal clubs of Philadelphia, the stronghold of cricket in this country, and was won by Belmont Cricket Club, with 8 out of 10 games; the other teams stood: Merion, 7 out of 11; Germantown (team B), 6 out of 10; Germantown (A), 5 out of 11; Philadelphia, 1 out of 10. Belmont C. C. also won the Philadelphia Cup. Paterson won the Metropolitan District league championship (New York) and the Knickerbocker Athletic Club won the New York Cricket Association Championship. The annual League Association match was won by the Metropolitan League. The Philadelphians won their annual matches with New York teams. The annual championships of the Intercollegiate Cricket Association, composed of Haverford, Harvard, and the University of Pennsylvania, were won by Pennsylvania. The last named beat Haverford 173-165, and Harvard by default; Haverford beat Harvard 101-99. The Northwestern Cricket Association, organized in 1896, and composed of Chicago, Denver, Omaha, Minnesota, Cincinnati, St. Louis, and Winnipeg teams, held its annual tournament August 19-26, at Chicago, whose team won the championship.

CRIME. The record of criminal statistics in the United States prepared by the Chicago *Tribune* presents the following statistics of murders. The total number of deaths by violence in 1901 was 7,852, as compared with 8,275 in 1900. The causes are classified as follows:

Quarrels	4,646	Resisting arrest	134
Unknown	1,291	Highwaymen killed	70
Liquor	820	Riots	36
Jealousy	284	Self-defense	23
By highwaymen	193	Strikes	20
Insanity	174	Outrage	12
Infanticide	149		

The number of legal executions in 1901 was 118 as compared with 119 in 1900, 131 in 1899, 109 in 1898 and 127 in 1897. "There were 82 hanged in the south and 30 in the north, of whom 71 were negroes and 47 whites. The crimes for which they were executed were: Murder, 107; criminal assault, 9; attempted criminal assault, 1; and train robbery, 1." The total number of lynchings in 1901 was 135, as compared with 115 in 1900, and 107 in 1899. Of these lynchings, 121 occurred in the South and 14 in the North. Of the total number, 107 were negroes, 26 whites, 1 Indian and 1 Chinaman. The alleged crimes were as follows:

Murder	39	Alleged theft	1
Criminal assault	19	Keeping a gambling house	1
Theft	12	Suspected of killing cattle	1
Murderous assault	9	Resisting arrest	1
Attempted criminal assault	8	Insulting white woman	1
Cattle and horse stealing	7	Burglary	1
Complicity in murder	6	Arson	4
Quarrel over profit sharing	5	Suspected murder	3
Suspected criminal assault	1	Forcing a white boy to commit crime	1
Murder and criminal assault	1		
Train wrecking	1		

"Besides these, 9 were lynched because of race prejudice, 3 for unknown causes, and there was 1 case of mistaken identity."

One of the most suggestive discussions on the subject of crime during 1901, was by Mr. Eugene Smith, of New York, on "The Cost of Crime," presented to the International Prison Association. The total cost of crime is divided into (1) the cost of preventing crime, (2) the direct damage from crime. In estimating the amount of expenditure on the national crime account the writer based his figures upon conclusions drawn from the detailed returns from particular cities and towns, assuming that the same conclusions would apply to other cities and towns similarly situated. On this basis he concludes that the total amount of city and county taxes paid by the dwellers in cities averages \$3.50 for each inhabitant, and for the rural

districts \$1.00 per inhabitant. The total cost of crime, the known expenditure for this purpose by State and national governments being included, was then estimated as follows: City and county taxation chargeable to crime—30,000,000 inhabitants of cities at per capita rate of \$3.50, \$105,000,000; town and county taxation chargeable to crime, 45,000,000 inhabitants at \$1.00, \$45,000,000; federal and State taxation chargeable to crime, not less than \$50,000,000; total, \$200,000,000. This sum, approaching though it does the cost of public education is only the cost of preventing crime. There yet remains the assessment of the direct damages of crime. The author computes from various bases of judgment that the average annual profits of the habitual criminals are \$1,600. The number of persons now in confinement in the United States is 100,000, of whom 40 to 50 per cent. may be classed as habitual criminals. But the number of prisoners represents only a fraction of the actual criminals in the United States. The habitual criminal is the one most skilled in escaping detection. "The percentage . . . of habitual criminals among the total number of criminals at large is much greater than their percentage among prisoners, and the author thinks that the total number of habitual criminals at large in the United States is not less than 250,000. On the basis of \$1,600 each, the aggregate annual income of the habitual criminals of the United States is \$400,000,000. This amount, however, represents only the "net profits" of crime to the criminal, and is "not a measure of the actual loss and damage caused by crime. Stolen goods can be converted into cash only at a great discount; the amount of money realized by the thief is but a fraction of the real value of the article stolen. Is it more than one-half or two-thirds? And yet the real value is the measure of the loss." There should be added to this the cost of arson, a crime which usually escapes detection; and the money value of the time, life, and labor lost and the expense incurred as a result of the 7,351 homicides, 8,347 assaults, and 454 cases of malicious mischief and trespass; and also the cost of locks, bars, bolts, safes, vaults, and burglar alarms, appliances which owe their existence to crime. When these supplementary items are added to the \$600,000,000 of computed cost, there results an enormous aggregate, considerably exceeding, on the basis of Mr. Smith's figures, one billion dollars, or more than 12-10 per cent. of the total wealth of the United States.

The Hon. Otis Fuller, general superintendent of the State Reformatory, Ionia, Mich., at the meeting of the wardens' association discussed among other topics the fee system and the subject of prison labor: "I believe the day is not far distant when every person engaged directly or indirectly in the administration of justice will be placed upon a salaried basis, and his financial reward for protecting the rights of the innocent will be as great as his reward for convicting the guilty. Then the shameful spectacle of constables, marshals, and justices of the peace engaged like pawn brokers or peanut vendors in a scramble for business which may involve the sacred liberties of their fellow men will be a thing of the past." The discussion which followed this paper showed that the fee system, while slowly disappearing, is still in vogue in many States. In Ohio, for example, sheriffs receive 50 cents a day for the keep of prisoners, and even when sentenced to the penitentiary they are sometimes held for two or three weeks in order to secure the fees. Mr. Fuller was also vigorous in advocacy of convict labor: "It seems strange that the voters or the tax payers should be fooled with the theory that idleness can be a source of wealth, and that it benefits free labor to be obliged to support itself and idle prisoners in addition. Yet this sort of argument seems very attractive, and each year shows further encroachments upon prison labor. Labor is the first requisite of prison reform. Many go into prison because they have never learned to work; many more because they have never learned to do anything well enough to hold a job. So when a young man leaves prison with a habit of industry fixed by regular hours of labor every day under a watchful instructor who sees that the work is well done, he has made an excellent start toward reform. So labor is absolutely necessary for the prisoner's good, for the public is the financial gainer by the prisoner's reformation. To make this labor otherwise than productive is a wanton waste and a great wrong to the mass of the people who are taxed to support the prisoners."

Mr. Z. R. Brockway, for many years superintendent of the Elmira (N. Y.) Reformatory, contributed to the proceedings of the American Social Science Association an important paper on *The Best Treatment of Criminals Whether Felons or Misdemeanants*, largely based on his own observations. He states that criminals as a class are physically devitalized and degenerate; that 81 5-10 of those which have come under his own observation are undisciplined of mind, and that not one of these had received a college education—that intellectually they are both helpless and wayward; that criminals taken as a class have not been trained for useful work, their industrial defects being not merely a lack of skill, but a lack of application. "The worthless class for industry, as discovered on admission, is say 85 per cent. of all, and more than that proportion . . . is improvident." The total money deposited by 1,500 persons did not exceed \$1,500. Habitual criminals are generally immoral. Of 10,000 criminals examined, 28 8-10 per cent. were without moral sense.

43-1-10 per cent. were below the average "of safe inhabitancy;" 22-6-10 per cent. were normal, and 5-8-10 per cent. were over-sensitive. The conclusion is that too much reliance can be easily placed upon moral and religious means for reforming prisoners who do not readily respond to moral motives. The "culture field" of criminals is the class of misdemeanants. Every year 175,000 persons are arrested for the first time charged with misdemeanors, and out of this class the habitual criminals are recruited. "Shiftless, inadequate measures with the misdemeanants, together with the inadequate damage done by turning out from institutions lads and others institutionized, untrained in industry and in habits of self-support, is the prolific source of crime." Mr. Brockway considers that the prevention of crime must be the work of public institutions, mainly prisons and reformatories, and that serious defects now exist in the prison system: (1) Failure to legislate and treat with reference to the general effect upon the volume of crimes; (2) lack of centralized prison administration which is also necessary to secure adequate statistics; (3) sentimentality in prison management; (4) incompetency in management due to the influence of partisan politics; (5) exaggerated estimate of the importance of productive prison labor; (6) arrogant ostracism of ex-criminals. Aside from the correction of these evils, Mr. Brockway considers the most effective measure of reform to be the adoption of the educational idea in prison discipline. This includes physical culture by gymnasiums, manual training schools, and military training, intellectual culture of every grade; appeals to the æsthetic, moral, and spiritual senses; intelligent direction of the life of the prisoner, with the use of the indeterminate sentence, so that when the prisoner comes to deserve his freedom he may straightway receive it. Mr. Brockway also proposes, in order to teach the prisoner self-rule and appreciation of the fact that the law "... is a legitimate expression of a public life and prospect of which he himself partakes," that a measure of self-government shall be introduced into prisons. On the whole, most confidence is placed in the system of industrial training as a means of reformation. "After all, the chief concern must be to fit the prisoners for self-subsistence, properly earning, spending, saving; to impart the necessary skill of hand and eye, in a particular trade or occupation, ... to give power of application and endurance. ... This seems most reasonable when it is remembered that crime springs from ill-conditioned property relations. The bulk of crimes are against the property rather than the person or the peace. Of the fifteen hundred prisoners under my charge, 94 per cent. were property offenders, and the crimes of others could be traced to property. All admit that adjustment of the prisoner's economic relations promotes rehabilitation, and I affirm such adjustment as the indispensable requisite to safe discharge and afterward to safe habitancy."

At the congress held at Amsterdam, October 1, 1901, the occasion was seized by the Italian school to smooth the way for an understanding with the French school. It was deputed to Enrico Ferri to give a moderate expression to certain extreme views commonly attributed to the Italian school. "By establishing their first principle that certain men are born criminal, they did not mean that such men are condemned by some inexorable fate to the actual commission of crime. The hereditary and organic dispositions with which a man is born may be modified through the persistent influence of the social environment in which he lives, and by the education, physical, mental, and moral, to which he may be subjected. But when the inborn dispositions are left to drift toward violence and cunning, and the primitive bestiality of man revives, when to the lack of education are added want and alcoholism, then crime is as sure to follow as the solution to mathematical equations. The practical conclusion of all the new science is, therefore, that society should provide each of its members with sufficient conditions of human development, should lessen want, and, most of all, should find a remedy for the ever increasing evil of alcoholism. In penal law, educative and preventive measures should take the place of repression; penalties should be graduated, not, as in present penal codes, according to a hypothetical degree of personal culpability, but by a classification based on the degree of social danger presented by the criminal; judicial procedure and organization must be so modified that the physician be an aid to the judge, and the judge himself be a criminologist. The authorized members of the French school received this declaration of principles kindly, giving all to understand that the difference between them and the Italians was one of degree only."

During the year indeterminate sentence laws were passed in New Jersey, New Hampshire, Connecticut, New York, and Kentucky. The Indiana report shows: (1) 85 per cent.—that is, 971 out of 1,141 cases—were satisfactory; (2) habitual criminals are in for longer terms which they do not like, and accordingly hasten to leave Indiana at the first opportunity.

Samuel J. Barrows, commissioner for the United States on the International Prison Commission, has prepared a report on the penal codes of France, Germany, Belgium, and Japan, dealing with the historic aspects and criminal procedure. The report contains an interesting article on Japanese prisons, where advanced methods

exist. The Commission appointed to codify the criminal and penal code of the United States have made their report. The first code (1790) contained 33 sections; this of 1901, 461 sections. The report is confined to the classification, definition, and punishments of crimes. According to the recommendation of the National Prison Congress, the last Sunday in October is designated as Prison Sunday. The object is to educate the community in the causes and aspects of crime, and to impress the public with a realization of responsibility for the conditions and administration of prisons and reformatories. The annual report of the city magistrates of New York compares the conditions of crime in 1800 with 1900. Twenty-six new crimes have been added. Complaints of masters against apprentices and crimes incident to slavery have been done away with.

CRISPI, FRANCESCO, Italian statesman, died at Naples, August 11, 1901. He was born at Ribera, Sicily, October 4, 1819, and received his education in law at the University of Palermo, where he graduated in 1837, and began his studies for the magistracy. About 1843 he entered into the conspiracy that finally (1848) led to the overthrow of the kingdom of the Two Sicilies, and became at thirty years secretary of the revolutionary government that was established in Sicily. In 1849, with the Neapolitan occupation of Sicily, Crispi fled in turn to France, England, Malta, and Turin, where he lived in extreme poverty and obscurity, until in 1859 he returned to Italy to join Garibaldi in the expedition of "The Thousand" to Sicily. When the overthrow of Bourbon power in Crispi's native land was accomplished (1860), he became Garibaldi's secretary of state; and it was while he held this office that he declared his famous doctrine, "Monarchy unites us, a republic would divide us"—a policy rigidly adhered to throughout his varied political career. In 1861 he first took his seat in the Italian parliament and for 16 years was no more than a fairly active member of that body. When the radical element came into power in 1876 and Depretis was intrusted with the formation of the new administration, Crispi was made president of the Chamber of Deputies. In 1878 he was appointed minister of the interior and the opportunity for the exercise of his executive force seemed at hand. Soon afterward, however, the disclosure of his having put away his wife to marry his mistress and thereby legitimize a daughter she had borne him fifteen years before, furnished capital to his political enemies, which caused his resignation and kept him out of public life for nine years. The defeat of the Italians at Dagali (1887), in the war against the Abyssinians resulted in a ministerial upheaval that placed Crispi once more in the cabinet as minister of the interior under Depretis, upon whose death he was selected by the king to form the new cabinet. As premier, he ruled with iron power. In 1892, however, he resigned as the result of an investigation into certain irregularities in the management of the Banca Romana. A year later he returned to power and undertook at once to place Italy among the great colonizing nations of the world; but the crushing defeat of the Italians under General Baratieri (*q.v.*) by the Abyssinians at Adowa (1896) provoked a storm of popular indignation throughout Italy, the inevitable result of which was the resignation of the man whose name was so closely associated with colonial exploitation. Thereafter Crispi lived the life of a political recluse, still in the Chamber, but rarely participating in discussion. Conflicting views as to Crispi's motives obtain among those who attempt to fix his place in Italian history. An indomitable force, he of necessity made many enemies, who, assailing his private character, which was not impeccable, have asserted his dishonesty and lust for personal glory. What he was, may be left unsettled; what he accomplished, is a large portion in the achievement known as the "United Italy," with which his name is inseparably connected.

CROATIA and SLAVONIA, a division of the kingdom of Hungary, situated northwest of Bosnia, have an area of 16,773 square miles, and a population (1901) of 2,397,240. Agram, the capital, has 57,930 inhabitants, an increase of 49.5 per cent. in ten years. The country is directly under control of the Hungarian crown, which is represented by a viceroy, responsible to both the Hungarian prime minister and the Croatian diet. There is autonomy in home affairs, including justice and public instruction. The Croatian diet sends 40 members to the Hungarian parliament, and there is always one Croatian member in the Hungarian ministry. The revenue and expenditure balanced in the budget of 1900 at 18,576,165 kronen. Agriculture is the chief occupation. The principal products are wheat, rye, barley, oats, maize, and potatoes. The silk industry in 1898 gave occupation to 16,000 persons, and the product was valued at 330,516 kronen. The mineral products included coal, iron, and salt. There is a university at Agram and a number of gymnasia; commercial schools and primary schools are supported by the government, the total enrollment being over 215,000.

CROIZETTE, SOPHIE ALEXANDRINE (Mme. J. S. ANTOINE STERN), French actress, died in Paris, March 19, 1901. She was born at St. Petersburg, Russia, March 19, 1847, and was educated at Versailles, France. After an engagement at the

Paris Conservatoire she made her début at the Comédie Française in 1869 and won her first great success in *l'Été de la Saint Martin*, a one-act play by Meilhac and Halévy, following this with a triumph in *Jean de Thomeray*. It was in the rôle of *Sphinx*, in a play by M. Feuillet, that her acting provoked vigorous criticism for its audacious qualities. After appearing for a number of years in various plays by the poulger Dumas, Mme. Croizette (in 1880) followed Sarah Bernhardt in the rôle of Clorinde in *l'Aventurière*, and a year later created Lionnette in *la Princesse de Bagdad*. In 1885 she married and retired from the stage.

CROLY, JANE CUNNINGHAM ("Jenny June"), journalist and club woman, died in New York City, December 23, 1901. She was born at Market Harborough, England, December 19, 1829, and came to this country in 1839. In 1856 she married David Croly, a journalist, and for more than forty years afterwards she held editorial positions on various newspapers and magazines. Among these were the *Democratic Review*, the *Weekly Illustrated News*, the *Home Maker*, and *Godey's Magazine*. She was the New York representative of a number of southern newspapers. The *Woman's Cycle*, later the *New Cycle*, was founded by her in 1889 to further the interests of women, and she called the first Woman's Congress in New York in 1856. Mrs. Croly founded Sorosis, the oldest woman's club, in 1868, and served as its president, 1868-70, and 1876-86, and also the Woman's Press Club in 1889, of which she was president for a number of years. She published several books, including a cookery book, and one on the woman's club movement in America. In 1892 she became professor of journalism and literature in Rutgers Women's College, which institution conferred upon her the degree of L.H.D.

CROQUET (ROQUE). Croquet has developed into a highly scientific game and is receiving much attention in its newly specialized form. The twentieth annual tournament of the National Roque Association of America was held on the sanded, rubber-cushioned courts of the Association at Norwich, Conn., during August 19-22, 1901. There were entries from seventeen clubs. C. C. Cox, of Malden, Mass., won the Van Wickle gold badge. Honors for the national championship were tied between W. H. Wahley, of Washington, champion in 1898; C. C. Cox, of Malden; and George C. S. Strong, of New London, each with 11 out of 14 games. Wahley won on the play-off, defeating both his rivals in exciting games. The second division championship was won by H. P. Howard, Jr., of Washington, with 9 out of 10 games; second, A. L. Williams, of Washington, 7 games; Third division, Floyd Cronska Moosup, 9 out of 10; second, S. M. Crosby, New York, 7 games.

CROSSMAN, Sir WILLIAM, British major-general and member of Parliament, died in London, April 19, 1901. He was born at Cheswick, Northumberland, June 30, 1830, and was educated at the Royal Military Academy, Woolwich, becoming lieutenant in the Royal Engineers in 1848. General Crossman's military experience extended over a period of more than thirty-five years, during which time he was in charge (1866-69) of consular buildings in China and Japan, secretary to the Royal Commission in the defenses of Canada (1862), inspector of submarine defenses (1876-81), and commander of the Royal Engineers in the Southern District (1882-85). In 1885 he was elected to the House of Commons as a Liberal from Portsmouth. Later he became a Liberal-Unionist, refusing to support Mr. Gladstone in his Home Rule policy. He was created C.M.G. in 1876 and K.C.M.G. in 1884.

CRYOLITE. All of the cryolite used in the United States is obtained from Greenland, the imports in 1900 amounting to 5,437 short tons, valued at \$72,763, and those of 1899 were 5,879 short tons, valued at \$78,676. Cryolite, which is a fluoride of sodium and aluminum, is used in the manufacture of aluminum, sodium salts, hydrofluoric acid, and opalescent glass.

CUBA, the largest island of the West Indies, is, from Cape Maysi on the east to Cape San Antonio on the west, 730 miles in length. Its breadth ranges from 100 miles in the east in the Province of Santiago to 25 miles in the neighborhood of Havana. No exact measurements of its area have been made, and there is a variation of 2,575 miles between the area of 46,575 square miles given by the United States Coast and Geodetic Survey, and that of 44,000 square miles, given by the Information Division of the War Department. The six provinces into which Cuba is divided for administrative purposes have areas as follows: Havana, 2,772 square miles, Matanzas, 3,700 square miles; Pinar del Rio, 5,000 square miles; Puerto Principe, 10,500 square miles; Santa Clara, 9,560 square miles; Santiago, 12,468 square miles. The population of Cuba, according to the census taken by the United States military authorities in 1899, was 1,572,797. Of this population, native whites represented 57.8 per cent.; foreign whites, 9 per cent.; negroes, including those of mixed descent, 32.3 per cent., while the Chinese represented less than 1 per cent. The population by provinces was as follows: Havana, 424,804, including the city of Havana with 235,981; Matanzas, 202,444; Pinar del Rio, 173,064; Puerto Principe, 88,234; Santa Clara, 356,536; Santiago, 327,715.

Finances.—The following table, prepared by the Division of Insular Affairs of the War Department, shows the revenues and expenditures of Cuba for the fiscal years 1900 and 1901:

REVENUES.		
	1900.	1901.
Customs	\$16,068,035.90	\$15,945,666.42
Postal	258,237.17	367,950.28
Internal	884,783.29	658,535.92
Miscellaneous	174,848.99	182,736.96
Total	\$17,385,905.35	\$17,154,939.58
EXPENDITURES.		
Customs	841,376.59	910,993.66
Postal	494,539.09	524,198.85
All other	14,355,537.38	16,209,802.30
Total	\$15,691,453.06	\$17,644,994.81

Agriculture.—Judged by export figures, the year 1901 was a prosperous one for the farming interests of Cuba. Comparing the statistics of exports to the United States for the eleven months ending in November with the same period of 1900 it will be seen that there was a material increase in the principal crops. Sugar exports rose from 651,497,257 pounds in 1900 to 1,259,106,823 pounds for the eleven months' period of 1901; and tobacco, leaf and cigars, from 12,678,949 pounds in 1900 to 16,472,552 in 1901. The difficulty of securing sufficient labor to cultivate the land was again experienced in 1901. The most widely discussed and apparently vital question that arose in connection with Cuban agriculture was that of reciprocal tariff concessions between the United States and the island. (See paragraph The Sugar Question.) The contention of a large number of planters is that without some reduction of the duty on sugar and tobacco it will be impossible for them to compete in the only important market available—the United States—against the protected beet-sugar industry and the prohibitively protected manufactured tobacco products. In both sugar and tobacco, however, the amount of exports to the United States increased, tobacco about 25 per cent. and sugar nearly 50 per cent. over the amounts exported in 1900. As applied particularly to tobacco, the demand for the reduction of duty of 20 per cent., which represents the minimum reduction agreed to by the planters, is based upon the desire to compete with the cigar makers of the United States. The duty on cigars is \$4.50 per pound and 25 per cent. ad. valorem; and it is stated that, counting the cost of shipping, cigars which cost in Cuba \$30 per thousand can not be delivered in the United States for less than \$93.50 per thousand. At this price, the Cuban tobacco growers assert, it is impossible to compete with the trade in American made cigars. American cigar makers, on the other hand, maintain that any reduction of duty on cigars and cigarettes will result in lowering the pay of the workers in the Florida factories, where most of the imported Cuban leaf tobacco is manufactured, and in the inevitable reduction in the price of the better grade of cigars. While the Cubans demand the privilege of turning their growth of leaf tobacco into the finished product on their own estates and with their own labor, the manufacturers of the United States prefer to keep the duty on leaf tobacco down to a mere nominal rate and keep their factories at work. The American manufacturers contend that with a lightening of the tariff charges Cuban manufacturers would import Porto Rican tobacco, which is of inferior quality, make it up and sell it for the Cuban product. The Cubans assert that this practice, once confessedly resorted to, has been definitely abandoned. Little opposition to the tariff reduction asked comes from the American tobacco growers, for their product is of an admittedly lower grade, the best of which is used for wrappers, but not capable of competing with the Havana grades.

Cuban Commerce.—The statistics of Cuban commerce for the fiscal year ending June 30, 1901, show total imports of \$65,050,141, of which \$28,078,702 came from the United States, and exports of \$63,115,821, of which \$45,497,468 went to the United States. These figures show a decrease of imports over the previous year and an increase of exports. For the fiscal year 1900, the total imports to Cuba were \$71,681,187, of which \$28,078,702 came from the United States, while the exports in 1900 amounted to \$45,228,346, of which \$34,621,879 went to the United States. In 1892, which may be taken as an ordinarily prosperous year under the Spanish régime, the imports to Cuba were \$64,000,000, and the exports, \$93,000,000. It will be seen then that though the imports are not below what they were before the war, owing for the most part probably to renewed purchase for improvements made by

the Cuban sugar planters in the hope that the United States tariff would be lowered in their behalf (see paragraph The Sugar Question), the exports of Cuban crops and more especially of Cuban sugar, are still far below their normal amount. The increased exports of Cuba for the fiscal year 1901 were largely accounted for by the increased exports of sugar and tobacco. The exports of sugar and molasses and its manufactures amounted in 1900 to \$18,668,797, and in 1901 to \$28,224,955. The exports of tobacco manufactures amounted in 1900 to \$21,712,655, and in 1901 to \$28,906,040. The United States in 1901, as in 1900, took practically all the sugar that was exported. But while the exports of tobacco increased during the year by over \$5,000,000, the United States took only some \$300,000 more in 1901; the figures being respectively \$12,934,339 in 1900 and \$13,175,793 in 1901. The only other considerable exports of Cuba were cocoa, \$281,211 in 1900 and \$514,062 in 1901; vegetables and fruits, \$584,756 in 1900, and \$1,062,371 in 1901; wood and manufactures of wood, \$1,565,952 in 1900, and \$1,289,258 in 1901, and vegetable fibres, \$649,959 in 1900, and \$1,204,577 in 1901. Of imports to Cuba may be mentioned wheat flour to the amount of \$2,154,702 in 1900, and \$2,206,759 in 1901; coffee, \$1,679,796 in 1900, and \$2,082,945 in 1901; rice, \$3,414,388 in 1900, and \$3,335,721 in 1901; wines and liquors, \$3,508,807 in 1900, and \$2,727,279 in 1901; animals and animal products, \$11,759,248 in 1900, and \$8,476,509 in 1901; meats and meat products, \$5,931,943 in 1900, and \$8,791,689 in 1901; oils, etc., \$1,293,040 in 1900, and \$2,598,988 in 1901; boots and shoes, \$2,291,362 in 1900, and \$1,638,084 in 1901; cotton and manufactures, \$7,078,023 in 1900, and \$6,067,939 in 1901; vegetable fibres, \$3,394,250 in 1900, and \$2,056,824 in 1901; wood and manufactures, \$1,014,194 in 1900, and \$2,667,027 in 1901; machinery, etc., \$2,459,493 in 1900, and \$2,495,417 in 1901; iron and steel manufactures, \$1,163,892 in 1900, and \$2,988,002 in 1901; other metals and manufactures, \$1,460,125 in 1900, and \$821,184 in 1901.

As stated by the secretary of war, of the \$37,000,000 of merchandise which Cuba imported in the fiscal year ending June 30, 1901, from countries other than the United States and of the much greater amount which they would import if prosperous, and with proper reciprocal tariffs, a large part would inevitably come from the United States. An examination of the figures of Cuba's commerce shows that in 1901 the United States supplied less than \$500,000 of over \$6,000,000 worth of cotton goods imported; less than \$22,000 of nearly \$700,000 worth of woollen goods; less than \$171,000 of over \$2,000,000 worth of vegetables and vegetable fibres; less than \$329,000 out of over \$2,700,000 worth of wines; only \$713,000 out of nearly \$2,598,000 worth of oils; only \$422,000 out of \$1,053,000 worth of chemicals and drugs; only \$1,994,000 out of \$8,476,000 worth of animals and animal products; only \$405,000 out of \$1,638,000 worth of manufactures of leather, and only \$3,000 out of \$3,335,000 worth of rice. Substantially the whole of these articles might under proper conditions come from the fields and factories of the United States.

The Sugar Question.—During the whole year, and especially in the late autumn, when Cuba's sugar crop was ready to be cut, the question of what concessions, if any, the United States would grant to Cuba's sugar exports was widely discussed and was admitted to be of the utmost significance to the whole industrial situation of the island. The case of Cuba as presented by the president, secretary of war and by General Leonard Wood, the military governor of the island, was simple in character, and may be stated substantially as follows: In the three years since the island had been under the authority of the United States, the entire machinery of education, charities, sanitation, laws and administrative methods had been reconstructed or replaced. So far as a carefully drawn constitution, free elections held thereunder and the expressly stipulated authority of the United States to intervene to protect Cuba from domestic insurrection or from foreign aggression, could do so, provision had been made to insure a tranquil, stable and republican form of government. But no government could long endure, and no considerable state of civilization be maintained where the people were impoverished and left without means or hope of ordinary material welfare. And to this state it was asserted Cuba had been brought and could not be extricated unless tariff concessions were made by the United States. For the wealth of Cuba consisted, broadly speaking, in her tobacco and, more especially, in her sugar crops. For these products her natural, and in fact her only market, was the United States. But from the United States, Cuba was debarred by the high tariff wall erected by the United States against all foreign countries. And, therefore, the sugar question in Cuba, reduced to simplest terms, was whether the United States tariff wall should be lowered, or whether the administrative labors of the United States in Cuba for three years past, together with the expenses and purpose of the Spanish War, should be allowed to go to waste coincidentally with the waste of the Cuban sugar-cane fields. The argument on the subject resolved itself into, first, a statement of undisputed fact as to Cuba's position in the sugar markets of the world and of the United States; and, second, a controversy as to the effect upon the United States' sugar industry that would result from

giving Cuban sugar a virtually free access to this country. The statement of fact and the ensuing argument may be stated as follows:

Cuba's Position in the Sugar Markets of the World.—Owing to direct or indirect bounties on beet sugar offered by all the important European countries to their domestic producers, the world's production of sugar (See article SUGAR INDUSTRY) has increased rapidly of late years, and now largely exceeds the demand. Europe produces over twice as much sugar as she consumes, and as this surplus must either be sold or become a total loss, the domestic consumer is forced by various governmental devices to pay a high price for his sugar, thus allowing the producer to export sugar at or below the cost of production. In this way excessive pressure is brought to bear by the sugar-selling countries upon every market for sugar in the world, the cane sugar of the West Indies is driven out of competition, and England and the United States, the only two great sugar-importing countries, are made the especial dumping grounds for the bounty created sugar of the continent. In England, where no countervailing duties are charged upon bounty exported sugar, Cuba cannot possibly sell her sugar except at a loss, and therefore the only resource left to her is to persuade the United States to grant such a reduced tariff as will open a sugar market to her.

That Cuba has not at present a profitable market in the United States may be shown by the prices for sugar prevailing in the United States in 1901. The average cost of raw sugar to refiners in that year, that is, the average market price, was 4.047 cents a pound. Now the average duty on imported sugar is 1.68 cents a pound; ocean freights from Cuba, lightering, packing, and shipping charges, aggregate .35 cents a pound more; so that the Cuban manufacturer receives for his sugar less than 2 cents a pound when delivered at the port of shipment. As the price of the cane ranges from 1 cent to 1.25 cents a pound, this margin of less than 1 cent a pound for all expenses connected with the manufacture of raw sugar entails a loss estimated at about one-half a cent a pound. Hence to permit Cuban sugar to be sold at a reasonable profit in the United States, it is estimated that the sugar duties must be reduced at least 50 per cent., that is to say, from 1.68 cents a pound to .80 cent a pound or thereabouts. That the admission of Cuban sugar on these terms, even assuming that the entire crop would come to the United States, would not bring about a glut in the United States markets may be shown as follows:

The consumption of sugar in the United States for the calendar year 1901 was 2,372,316 tons, of which amount 439,986 tons was of domestic production; 380,499 tons were from Hawaii, Porto Rico and the Philippines, leaving imported tariff paying sugar to the amount of 1,551,861 tons. Of the tariff-paying sugar, 559,800 tons came from Cuba, leaving, in the rough, 1,000,000 tons imported from other countries. Now while the Cuban sugar crop may be increased greatly under improved industrial conditions, and with the assurance of a ready nearby market, and while the Cuban crop is in fact estimated at 875,000 tons for the crop year 1901-02, as against 635,856 tons for the preceding year, the fact nevertheless remains that the consumption of sugar in the United States increases at the rate of about 100 per cent. in every fifteen years, or more rapidly than the most optimistic estimates of the possible increase of the Cuban sugar crops. At the same time, the domestic production of sugar in the United States, including the production of the Philippines, Porto Rico, and Hawaii, is stated to be incapable of any large increase in the near future. And, therefore, allowing for a large annual increase in Cuba's sugar crops, the United States would still be forced to import annually one million tons of sugar. This estimate, however, leaves out of consideration the increase of beet sugar production in the United States, and it is precisely from the beet sugar interests that nearly all opposition comes against reducing the tariffs on Cuban sugar.

Beet Sugar vs. Cane Sugar.—The beet sugar industry in the United States has been practically developed to its present point within the last ten years. In the crop year 1892-93, the beet sugar crop of the country was 12,018 tons; in the crop year 1899-1900, it was 72,944 tons; for the crop year 1901-02, it was estimated at 150,000 tons. Evidently the possible increase of an industry which has made such strides within ten years is very great. Its advocates claim that it may become relatively as important in this country as it is in Germany. It depends upon intensive culture, and flourishes in sandy soil inapplicable to other crops. Moreover, the sugar beets may be produced very cheaply and at the same time return under present conditions a large profit, both to the farmers and to the beet sugar manufacturers. How cheaply beet sugar may be made is shown by the fact that Mr. Henry T. Oxnard, the spokesman of the industry, estimated in 1899 that refined beet sugar could be produced at 3.1 cents per pound, while since then other experts have claimed that it could be produced even cheaper, or at from 2.5 cents to 3 cents per pound. If these figures are correct, the beet sugar manufacturers are enabled to clear nearly 100 per cent profit on every pound of sugar sold. For the American Sugar Refining Company, which sets the price of sugar, is unable, owing to the existing tariff on im-

ported sugar, to sell refined sugar at less than 5 cents per pound. From this fact has arisen on the one hand a demand that Cuban sugar should be admitted free, and, on the other hand, a strong opposition to any lowering of tariff duties whatever. For the manufacturers of beet sugar are naturally desirous of retaining their present strategic advantage over the sugar trust; and in this they are backed by the beet sugar producers who see larger and further profits accruing to them. The sugar trust wishes to have the price of raw sugar reduced so as to prevent the beet sugar manufacturers from underselling it, and so capturing a part of its trade. The sugar trust has no objection to the domestic production of raw beet sugar, but it does object to the refining of the sugar by independent companies. Of the total amount of refined sugar amounting to 2,178,615 tons consumed in the United States in 1900, 67.3 per cent. was manufactured by the sugar trust, 28.7 per cent. by independent refineries, 9 per cent. by foreign refineries, and 3.1 per cent. by the sugar beet factories. To increase their relative proportions of the total amount of sugar refined, the beet sugar men oppose the lowering of Cuban tariffs, while the sugar trust advocates it. The arguments of the beet sugar interests were virtually as follows: It was alleged, first, that free trade with Cuba would not reduce the price of sugar in the United States, as the sugar trust would maintain the price and pocket the difference; second, that the increase in domestic beet sugar production had at present no appreciable limit, but that a limit would be arbitrarily placed upon it if Cuban sugar was admitted free, or if the sugar tariff were greatly reduced; third, that a large and unnecessary loss of revenue to the United States treasury would be caused by reducing the tariff; fourth, that the United States had already done enough and to spare in behalf of Cuba, and that its first duty in the present case was to its own producers, according them full protection as had been done in the case of all other domestic industries, especially in their experimental and developing stage. The trust argued, on the other hand, that free imports of Cuban sugar would greatly increase sugar consumption in the United States by lowering prices, and that this would not only be of advantage to the great body of consumers, but would materially aid such industries as the fruit preserving and confectionery interests; second, that the beet sugar producers and manufacturers were in no need of protection, as was shown by their own statements, and by the known facts of the cost of beet sugar production; third, that by lowered sugar tariffs, exports to Cuba would be greatly stimulated, and investors in Cuba would be enabled with the returning prosperity of the island to make large returns on capital invested.

Cuba's Need of a Sugar Market.—That the conflicting arguments and interests noted above would be largely instrumental in determining Congress as to what should or what should not be done for Cuba's sugar industry was hardly gainsaid. But these arguments and interests, based primarily on profits desired by rival industrial organizations, and only incidentally upon the necessities of Cuba, did not appeal to the public and the press, which were more inclined to consider Cuba's needs and the obligations of the United States to Cuba. As stated by the secretary of war in his annual report for 1901, Cuban planters relying upon generous treatment by the United States had made great efforts to revive their sugar industry, raising the product of sugar from 308,000 tons in 1899 to 615,000 tons in 1900 and to something like 800,000 tons in 1901. All the capital they had or could borrow had been invested in the rebuilding of their mills and the replanting of their land. More than half the people of the island were directly or indirectly dependent upon the success of the industry. If it succeeded, peace, plenty and domestic and political quiet might be expected; if it failed, the great body of laborers would be thrown out of employment, and poverty, starvation and anarchy would ensue. From the commercial side (see paragraph Commerce) it could hardly be doubted that the prosperity of Cuba and reciprocal trade relations with the United States would bring to this country far more prosperity than the starving out of Cuba and the loss of trade relations for the sake of a problematical enormous increase of beet sugar production in the United States. Politically, moreover, since Cuba had agreed to the doctrine of the United States (see paragraph Relations to the United States) that she should not put herself in the hands of any other power whatever her necessities or however impoverished and desperate her people, the correlative obligation rested upon the United States to treat her not as an enemy, but with due consideration for her welfare. Finally, there were the weightiest reasons of public policy based upon the strategic condition of Cuba toward the United States why the prosperity of Cuba should be sustained. For, as stated by the secretary of war, "the peace of Cuba is necessary to the peace of the United States; the wealth of Cuba is necessary to the wealth of the United States; the independence of Cuba is necessary to the safety of the United States; the same conditions which led to the war with Spain now require that a commercial requirement be made under which Cuba can live."

Constitutional Convention.—In accordance with the Congressional resolution of April 20, 1898, disclaiming any intention on the part of the United States to exer-

cise jurisdiction over Cuba beyond the time needed for the establishment of the Cuban government, an order was issued by the war department on July 31, 1900, providing for the election in Cuba on September 15 of a constitutional convention composed of thirty-one delegates from the different provinces of the island, who should frame and adopt a constitution for the people of Cuba. This convention opened on November 5, and the constitution it adopted was completed and signed on February 21, 1901. In general the form of the constitution is similar to that of the United States, the two most noticeable differences being the excessive safeguards thrown around individual rights and the extreme centralized form of government provided for. As instances of the rights guaranteed to individuals may be mentioned the following: Retroactive penal laws operating in favor of the criminal are permitted; relatives within the fourth degree of consanguinity or second of affinity are not obliged to give testimony against each other; private residences are, without the consent of the owner, to be considered inviolable to the extent that they can be entered at night only in case of sudden accident or crime; no person may be arrested except by warrant, and this warrant must be confirmed or vacated after a hearing and within seventy-two hours after the arrest; finally, suffrage is made practically universal, all male Cubans over twenty-one years of age and not mentally incapacitated or convicted of crime being entitled thereto. As showing the reason for the centralized government adopted, it is to be remembered that the several provinces of Cuba were never accustomed to much political autonomy, and that, if the province of Santiago, whose inhabitants are largely negroes, is excluded, the needs and political genius of the provinces are not sharply different from one another, as in many of the States of the United States, but correspond rather to the counties of a single State. Notwithstanding these facts, however, the government provided for may perhaps be considered as unduly centralized, since its functions include, for example, an absolute control over electoral matters, provincial and municipal, management of all public education, and "the general administration of public provincial and municipal affairs." By a series of checks, moreover, all final authority in the island is given to the president and through him to Congress; for while Congress can impeach the president, the president in turn can suspend the governors of provinces and also the decrees of provincial and municipal councils. In turn, again, governors of provinces can suspend provincial decrees and the mayors of municipalities, and finally the mayors can suspend the decrees of their own municipal councils. In a possible case then, if political excitement ran high, Congress could exercise authority over the acts of the smallest municipalities. For Congress could order the president, under threat of impeachment, to direct the governor of a province, under pain of suspension, to command the mayor of a municipality, under a similar threat of suspension from the governor, to suspend any and every decree of municipal council. While this particular case would probably never arise, yet a less direct and far extending sort of coercion might easily take place, and the possibilities of the system for facilitating political jobbery can hardly be gainsaid. On the other hand, the convention acted with great conservatism in many ways, and in some respects, as for example in having senators chosen by a joint body composed of the provincial councilmen acting in conjunction with double that number of electors chosen by popular vote, instead of having them chosen directly by the councilmen; the convention apparently took heed of defects which have exhibited themselves in the workings of the constitution of the United States. Summing up the whole matter the secretary of war stated in his report for 1901: "I do not fully agree with the wisdom of some of the provisions of this constitution; but it provides for a republican form of government; it was adopted after long and patient consideration and discussion; it represents the views of the delegates elected by the people of Cuba; and it contains no features which would justify the assertion that a government organized under it will not be one to which the United States may properly transfer the obligations for the protection of life and property under international law, assumed in the Treaty of Paris." The main provisions of the constitution are given in the succeeding paragraph.

Provisions of the Constitution.—Fundamental rights and guarantees: The constitutional convention meeting to establish "a government capable of fulfilling its international obligations, maintaining public peace, insuring liberty, justice, and promoting the general welfare," adopted the following constitution: Cuba is constituted "a sovereign and independent state," with "a republican form of government." The territory of the republic is composed of Cuba and its adjacent keys and islands, and is divided into the six provinces—Havana, Matanzas, Pinar del Río, Puerto Principe, Santa Clara, Santiago—now existing, but these divisions may be altered at will by acts of the provincial councils approved by Congress. The people of Cuba are those born within Cuba or of Cuban parents; Spaniards having acquired Cuban citizenship, and foreigners residing in Cuba for not less than five years and claiming naturalization. All male Cubans over twenty-one years of age, not mentally incapacitated or

convicted of crime, are entitled to the right of suffrage. To Cubans and foreigners alike certain individual rights are guaranteed, of which the following may be especially mentioned as differing from those familiar to English jurisprudence. No laws shall be retroactive "other than penal ones favorable to convicted or indicted persons." No person shall be arrested except by warrant of a competent judge or court, and such prisoner shall be given a hearing and the order for his arrest vacated or confirmed within seventy-two hours after his apprehension; but this provision may be suspended in case of peril to the state. "No person whatever is bound to give evidence against himself, nor husband and wife against each other, nor relatives within the fourth degree of consanguinity or second of affinity." "In no case shall the penalty of death be imposed for crimes of a political nature." Primary education shall be compulsory and gratuitous, and the state shall defray the expenses thereof until the provinces and municipalities are able to do so. The state shall also control secondary and advanced education as well as determine the conditions for the practice of the professions; but private educational institutions may nevertheless be freely established. The laws shall guarantee minority representation in all electoral matters in the house of representatives and in the provincial and municipal councils.

The Legislative Power.—The general legislative power of Cuba is vested in a senate and house of representatives. The senate is composed of four senators from each province, elected for eight years by the provincial councilmen acting in conjunction with electors double in number to the councilmen, and chosen by popular vote. The house is composed of one representative for each 25,000 inhabitants, elected for four years. One-half of the senate is renewable every four years, and one-half of the house every two years. Only native-born Cubans are eligible to the senate, but members of the house may be either native-born Cubans or naturalized Cubans who have resided in the republic at least eight years since their naturalization. Congress, consisting of the house and senate, is to hold two regular sessions each year, convening on the first of April and on the first Monday of November, and it may hold extra sessions either on its own initiative or when convened by the executive. The power to regulate and develop internal and external commerce, railroads, post roads, harbors, and canals is vested in Congress, and Congress is also charged with the duty of making rules for general, provincial, and municipal elections and of issuing orders "for the regulation and organization of all matters pertaining to the general administration of public, provincial, and municipal affairs." The initiative of all bills is vested equally in both houses, but no bill defeated in its entirety may again be considered in the same session. Treaties must be ratified by the senate, which is also authorized to sit as a court of impeachment to try the president of the republic, cabinet ministers, and governors of provinces on charges of violating the constitution, or of crimes "against the free exercise of legislative or judicial power." Loans when authorized either by Congress or by the provincial or municipal councils must receive the affirmative consent of two-thirds of all the members of the contracting body, and provision must be made at the same time insuring both payment of interest and final redemption of the loans.

The Executive Power.—The executive power is vested in the president, or, in case of his death or disability, the vice-president; both officers are elected by popular vote for a term of four years, and are disqualified from serving for three successive terms. The president must be at least forty years of age and must be either a native-born Cuban or a naturalized Cuban having served ten years in the Cuban wars for independence. All decrees, orders, and decisions of the president must bear the *referendum* of the cabinet minister in whose department they lie, and each cabinet minister is held personally responsible for decrees sanctioned by him. Governors of provinces may be suspended by the president for cause, pending an appeal to the senate, whose decision in the matter is final. The president is also authorized to suspend the resolutions of the provincial and municipal councils; but the illegality of these resolutions must then be affirmed by the courts. In general, the duty of the president is to sanction, promulgate, execute, and enforce the laws; to veto congressional bills which meet his disapproval and which must then be reenacted by a two-thirds vote to become law; to appoint, with the consent of the senate, diplomatic and consular officers and justices of the supreme court; to negotiate treaties and to take measures for the defense of the territory and the maintenance of public peace.

Provincial and Municipal Government.—The executive and legislative power of each province is vested in a governor and in a council of not less than eight or more than twenty members, elected by direct vote. The council has the right to decide all affairs concerning the province which are not within the general jurisdiction of the state or the special jurisdiction of the municipalities; but the council is prohibited from legislating in any way concerning election matters, and all resolutions of the councils deemed contrary to the laws and the constitution may be suspended by the governor of the province or the president of the republic, pending an appeal to the courts. Moreover, councilmen are personally liable for all acts committed by them

in the discharge of their official duty. The municipal governing power consists of a mayor and of a municipal council, both elected by popular vote. The mayor may be suspended for cause by the provincial governor, the resolutions of the municipal council may be suspended by the president, the governor, or the mayor, and both mayor and councilmen may be held personally responsible for their official acts.

Other Constitutional Provisions.—The judicial power is vested in a supreme court of justice and in such other courts as may be established by law. Justices of the supreme court must be Cubans by birth, thirty-five years of age or over, and must have practiced their profession for at least ten years. Cuba does not recognize any debts and obligations other than those legitimately contracted in behalf of the revolution subsequent to February 24, 1895. The laws and orders in force at the time of the promulgation of the constitution are to remain binding, so far as they do not conflict with the constitution, until they are revoked or amended. Amendments to the constitution are to be made by resolutions adopted by two-thirds of all the members elected to each house of Congress and approved by a constitutional convention consisting of one delegate to each 50,000 inhabitants in Cuba, elected by popular vote and convening within six months after the resolutions have been adopted by Congress.

Relations to the United States.—By order of Secretary Root the Cuban constitutional convention, which had at first been directed to embody in its constitution the relations which the convention considered Cuba should bear to the United States, was later instructed not to consider these relations until the constitution itself had been completed. So it was not until February 21, when the Cuban constitution (see paragraph Constitutional Convention) was signed, that General Wood, the military governor, communicated to the convention the provisions as to the future relations with the United States which the President thought Cuba should accept. These provisions were in substantial agreement with the first five of those contained in the so-called "Platt amendment" (see UNITED STATES, paragraph Congress), passed by the Senate on February 27 and by the House in March 1, as a rider to the Army Appropriation Bill, under the spur of the threat of an extra session of Congress. The full text of the Platt amendment, whose object is defined in its preamble, is as follows: "That in fulfilment of the declaration contained in the joint resolution approved April 20, 1898, entitled 'For the Recognition of the Independence of the People of Cuba,' demanding that the government of Spain relinquish its authority and government in the island of Cuba, and withdraw its land and naval forces from Cuba and Cuban waters, and directing the President of the United States to use the land and naval forces of the United States to carry these resolutions into effect, the President is hereby authorized to leave the government and control of the island of Cuba to its people as soon as a government shall have been established in said island under a constitution which, either as a part thereof or in any ordinance appended thereto, shall define the future relations of the United States with Cuba, substantially as follows:

"1. That the government of Cuba shall never enter into any treaty or other compact with any foreign power or powers which shall impair or tend to impair the independence of Cuba, nor in any manner authorize or permit any foreign power or powers to obtain by colonization or for military or naval purposes or otherwise, lodgment in or control over any portion of said island.

"2. That said government shall not assume or contract any public debt to pay the interest upon which and to make reasonable sinking-fund provision for the ultimate discharge of which the ordinary revenues of the island, after defraying the current expenses of government, shall be inadequate.

"3. That the government of Cuba consents that the United States may exercise the right to intervene for the preservation of Cuban independence, the maintenance of a government adequate for the protection of life, property, and individual liberty, and for discharging the obligations with respect to Cuba imposed by the Treaty of Paris on the United States, now to be assumed and undertaken by the government of Cuba.

"4. That all acts of the United States in Cuba, during its military occupancy thereof, are ratified and validated, and all lawful rights acquired thereunder shall be maintained and protected.

"5. That the government of Cuba will execute, and as far as necessary extend, the plans already devised, or other plans to be mutually agreed upon, for the sanitation of the cities of the island, to the end that a recurrence of epidemic and infectious diseases may be prevented, thereby assuring protection to the people and commerce of Cuba, as well as to the commerce of the southern ports of the United States and the people residing therein.

"6. That the Isle of Pines shall be omitted from the proposed constitutional boundaries of Cuba and the title thereto left to future adjustment by treaty.

"7. That to enable the United States to maintain the independence of Cuba and to protect the people thereof as well as for its own defense, the government of Cuba

will sell or lease to the United States lands necessary for coaling or naval stations at certain specified points to be agreed upon with the President of the United States.

"8. That by way of further assurance, the government of Cuba will embody the foregoing provisions in a permanent treaty with the United States."

Of the stipulations of the Platt amendment given above, those which were principally criticised, both in this country and in Cuba, were the third, sixth, and seventh, respectively, permitting the United States to intervene in Cuba for cause, binding Cuba to sell or lease naval or coaling stations to the United States, and leaving the title to the Isle of Pines to future negotiations between the two countries. The Isle of Pines, in the first place, had always been considered to be within Cuban boundaries, and it was only through lack of specific mention in the Treaty of Paris that it became technically one of those "other islands in the West Indies" ceded by Spain to the United States. By many, therefore, it was considered unfair for the United States thus to take advantage of a seemingly accidental omission in the treaty. As to the other two amendments, opponents of the administration considered that the demands made by Congress were far too sweeping, that they permitted the United States to intervene at will in Cuba, and that they in effect annulled the sovereignty of the future Cuban government and substituted for it what amounted practically to an American protectorate. On the other hand, many persons thought that the acceptance by Cuba of these two latter amendments was necessary in view of the organic political instability of the Cuban people and their inexperience in self-government, as a guarantee for the maintenance of a republican form of government in the island, and that the amendment authorizing United States naval stations in Cuba was also of great military importance to the United States. For if the United States did not hold naval stations in Cuba, foreign powers desiring in case of war to proceed against either the United States or Cuba might easily obtain a naval base in Cuban harbors, and the United States would be placed at an extreme strategic disadvantage either in protecting Cuba or her own shores. Finally, as it was the purpose of the United States to secure independence for Cuban citizens the right to intervene in Cuba was necessary not only in event of foreign aggression, but in case of internal disorders beyond the power of the central Cuban government to control. Presumably for these reasons so eminent an anti-imperialist as Senator Hoar stated that he considered the Platt amendment as proper and desirable.

On April 13, 1901, the Cuban convention, which did not look with favor upon the amendment, appointed a committee of five to learn its precise intent from the President at first hand. On the basis of the report of this committee, the Cuban convention on May 26, by a vote of 15 to 14, agreed to the amendment, as modified by their understanding of the President's explanations, given through Secretary Root, and as further modified by a series of resolutions added by the convention and defining or limiting each clause of the amendment. Of the qualifications made by the resolutions the most important were that the naval stations given to the United States by Cuba should in no case be used as "vantage points" for intervention in Cuba, but should be held solely to repel foreign aggression; that Cuba did not necessarily agree to carry out the plans for municipal sanitation already devised by the United States, but only such plans as might be "mutually agreed upon;" that intervention in Cuba should not take place without the "formal action of the United States;" that with the exception of foreign alliances militating against her independence, Cuba might freely "make political and mercantile treaties with any nation," and that while Cuba consented that the Isle of Pines should be omitted from her proposed constitutional boundaries, and its ownership left to treaty negotiations, still Cuba believed that the island was "actually comprehended within her boundaries." On May 31, the administration decided that the amendment as thus variously modified could not be accepted. For in the first place the convention had given to the unofficial explanations of Secretary Root the binding force of *dicta* of "the government of the United States," and in the second place the executive branch of the government could not, if it would, usurp the powers of the legislative branch and sanction the qualification of a definite law of Congress. On June 12, therefore, the convention, by a vote of 16 to 11, voted that "the constitutional convention proceeding in conformity with the order of the military governor of the island—has determined to add and does add to the Constitution of the Republic of Cuba, adopted on February 21," the full text of the Platt amendment without any change or qualification whatsoever.

Postal Frauds.—The United States Supreme Court on January 14, 1901, decided that the case of the government against C. F. W. Neely, former treasurer of the Department of Posts in Cuba, accused of fraudulent practices while in office, could be conducted at Havana. The point in dispute was as to whether the military occupation and control of the island by the United States was legal and sufficient to make it a part of the United States, so that extradition proceedings might not be required. The court decided that the occupation *was* legal and that extradition was not necessary, and on January 21 the State Department issued a warrant for the surrender of Neely to the Cuban authorities. After a long series of delays the trial

CUBAN ASSEMBLY COMMISSION.—Commission Sent by Cuban Convention to Confer
with President McKinley.

of Neely and of E. G. Rathbone, former Director of Posts, was begun at Havana; and at the end of the year the trial was still in progress. Neely was charged with criminally appropriating funds of the department to his own use, with bribery of subordinates, and with manipulating the books so as to conceal discrepancies. Rathbone was put on trial on the charge of collusion with Neely and misappropriation of funds through undue extravagance in personal expenses.

General Conditions.—Progress in systematizing the government of Cuba and placing its institutions under efficient and economical management went on steadily during the year. In pursuance of the plan of training the people to govern themselves after the United States government had withdrawn from the island, a rural guard was organized, including a total of 1,300 men and officers. The control of the municipal police was taken from the central government and placed under the municipalities, and several companies of Cuban troops were organized and assigned to coast artillery defense. By the end of the year, 34 hospitals were established, containing 2,844 beds, and 6 training-schools for female nurses had been instituted under the tuition of American trained nurses. The government training-schools for boys and girls were enlarged. The lepers of the island were gathered into two central institutions. Extensive improvements were made in the insane asylums, the prisons were repaired and each jail was provided with a physician and necessary medicines. School instruction also was introduced in the larger jails. Extensive repairs of streets and sanitary work was done in Havana, Santiago, Cienfuegos, and Santa Clara; sewerage and paving plans for Havana were completed, and a contract for \$555,000 for the improvement of Matanzas harbor was awarded. The school law practically giving the management of schools over to the localities concerned was said to have worked satisfactorily. Local boards of education to the number of 121 were elected by the people under this system. The work of changing the old military barracks into schools was continued, \$250,000 being expended for this purpose during the year. Besides this, large schools were established by changes in government buildings at Guines, Pinar del Rio, Matanzas, Ciego de Avila, and Colon, and a thoroughly modern school was placed under construction at Santiago, estimated to cost \$50,000. There were some 3,600 teachers employed during the year, with an average enrollment of pupils of 180,000, and an average attendance of 140,000. While the schools are now generally well supplied with modern books and furniture, there is stated to be still a great need for additional schoolhouses and thoroughly instructed teachers. The judiciary system does not yet work well, owing to the inbred prejudices of the Cubans for the spoils system. As stated by the secretary of war, the number of men suitable for a judicial career in Cuba is limited, and the working of the jury system is not satisfactory. Extensive state aid was furnished to indigent farmers during the year by the distribution of cattle, over 100,000 farmers being assisted in this way. The vexed question of what should be done with the large amount of real estate held by the government but claimed by the Roman Catholic Church, as also what disposition should be made of the mortgages held by the government, was satisfactorily settled during the year. The land formerly owned by the church was turned over to the United States by the Spanish crown, which had occupied it, in accordance with a long series of negotiations between the crown of Spain and the Holy See. When the United States declined to pay for the maintenance of the Catholic Church in Cuba, as the Spanish government had done, the church demanded that its property should be returned. A judicial commission appointed to consider the rights of the Church in the premises rendered a decision in its favor, and the military government then agreed to pay a rental of 5 per cent. upon the appraised value of the property, amounting to about \$2,000,000, with a five years' option to the government of Cuba, when organized, to buy the property at this appraised value. With regard to the mortgages held by the government upon property in different parts of the island, an adjustment was made by which the military governor took up the mortgages at 50 cents on the dollar and allowed the debtors interested to purchase them at the same rate.

Conditions in the island were uniformly peaceful during the year, and no necessity arose for the intervention of the United States military forces in the administration of the government. The real feeling of the Cuban people toward the United States was very difficult to ascertain. It appeared probable, however, that the so-called Revolutionary party, which was on the whole in control of the constitutional convention and of the local governmental administration of the island desired as complete an independence as possible for the island, and viewed with some suspicion the motives of the United States. On the other hand, the property interests of Cuba seemed very little in sympathy with this party and were said to desire annexation to the United States. Politically, however, these interests were weak and unpopular. Spaniards, Americans, English, and Germans are much more influential in the commercial life of the island than Cubans; the former holding probably three-fourths of all taxable property in the form of direct ownership, of mortgages or of open accounts. But these foreigners are entitled to no voice in the political affairs

of the island and are looked upon with distrust by the majority of unpropertied or poor Cubans. On this account, it is said that it will be very difficult to maintain a stable and harmonious government in Cuba until the average material welfare of the masses is raised much above its present level.

Elections.—In accordance with the provisions of the constitution, and of the electoral law declared by the military government, an election was held in Cuba on December 31, 1901, for the election of presidential and senatorial electors, and for the election of members of the house of representatives, governors of the provinces, and members of the provincial councils. By the same law, an election was announced for February 24, 1902, at which time the electors chosen on December 31, 1901, should cast their ballots for president, vice-president, and senators. The two candidates for president at the election on December 31 were General Estrada Palma (see article PALMA, ESTRADA), and General Bartolome Maso. General Palma, who had been active in the insurrection of 1868 and for a time president of the provisional government established at that time, and who, moreover, was head of the so-called American Junta, in 1898, was supported by nearly all of the prominent military and political leaders of Cuba, including General Maximo Gomez, Señor Gonzales, and Señor Capote. General Maso, on the other hand, a negro and lieutenant-general in the former Cuban insurrection, was supported, as was alleged, by various desperate bodies of extremists, including negroes, Spaniards, and revolutionists. The candidacy of General Palma was supported by practically all of the property interests of the island, while that of General Maso was pushed by appeals to race prejudice and a campaign cry of complete independence from the United States. Allegations were brought forward by the Maso party to the effect that the election Board of Scrutiny was composed wholly of Palma advocates. While this was not denied by the Palma men, they asserted that no charges of irregularities in registration or election returns had been brought forward or could be proved. As a result of the election, Thomas Estrada Palma was elected president; that is to say, the electors who would cast votes for him were elected, and of the 63 members who would compose the house of representatives, 55 Palma men were chosen. The senate also, as a result of the elections, will support Palma by a large majority; all the senators elected in Matanzas, Havana, and Santa Clara being of his party. The civil governors elected in the several provinces were as follows: Perez, in the province of Pinar del Rio; Nunez, in Havana; Lecuona, in Matanzas; Gomez, in Santa Clara; Recio, in Puerto Principe; and Echeverria, in Santiago. The number of representatives in the legislature from each province, elected on the basis of population, is as follows: Havana, 17; Santa Clara, 14; Santiago de Cuba, 13; Matanzas, 8; Pinar del Rio, 7; Puerto Principe, 4.

Executive Officers.—The executive officers of Cuba in 1901, under the temporary government of the United States, were as follows: Military governor, Brig-Gen. Leonard Wood; secretary of state and government, Diego Tamayo y Figueredo; secretary of finance, Leopoldo Cancio; secretary of justice, José Varela y Jado; secretary of agriculture, commerce, and industries, Perfecto Lacoste; secretary of public instruction, Enrique José Varona; secretary of public works, José Ramón Villalón. See POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF.

CUMBERLAND PRESBYTERIAN CHURCH, a sect of Presbyterians strongest in the central, south central, and southwestern States, was independently organized in 1810. The church, which includes 16 synods and 122 presbyteries, now has 182,449 members, 1,589 ministers, 2,963 churches with property valued at \$4,267,561, and over 104,000 Sunday-school teachers and scholars. Contributions for all purposes in 1901 amounted to \$822,150, an increase of about \$150,000 over the aggregate of the previous year. The Cumberland Presbyterians have a publishing house in Nashville, Tenn., and are represented denominationally by the *Cumberland Presbyterian*. A dozen or more educational institutions are under the control of the church; its theological seminary is at Lebanon, Tenn. The home missions of the church, which are found in twelve States, and extend as far west as the Pacific coast, are directed with especial attention to the German and colored peoples. The foreign missions have occupied fields in China, Japan, and Mexico, and the work in the first-named country, which has suffered from the anti-foreign outbreak of 1900, is to be renewed with an increased force of missionaries. The seventy-first meeting of the General Assembly of the church, which was held May 16-23, 1901, at West Point, Miss., passed a constitutional amendment suggested in 1900 and afterward approved by a majority of the presbyteries, on the rotation of deacons and elders; it also adopted the report, as amended after discussion, of a special committee on the divorce question that the confession of faith "is to be understood as teaching that the courts cannot righteously dissolve marriage relations without duly following the teaching of God's word." In 1902 the assembly will convene at Springfield, Mo.

Cumberland Presbyterian Church (Colored).—This body, with 450 ministers, 400 churches, and a constituency of about 40,000, in affiliation as to polity and doctrine

with the Cumberland Presbyterian Church, was founded in 1869. The General assembly of the church held its annual session during the middle of May, 1901, in Pratt City, Ala.

CURACAO, a Dutch colony in the Caribbean Sea, north of Venezuela, consisting of a group of islands, the largest of which is Curaçao. The total area is 403 square miles, that of Curaçao being 210. The population January 1, 1899, was 51,524, of which Curaçao had 29,558, Aruba 9,349, Bonaire, 4,829, St. Martens 3,577, Saba 2,779, and St. Eustache 1,432. About five-sixths of the population is Catholic. The Jews number 831. The colony is administered by a governor, and a council composed of an attorney-general and three other members, all nominated by the crown. A colonial council, including the administrative council, and eight others, provides local government. A subordinate administrative agent is placed over each island except Curaçao. A militia is maintained, numbering (1899) 383, with a garrison force in Curaçao of 169. A ship of the Dutch navy is constantly stationed in the islands. The revenue, consisting of customs, land tax, excise dues, and some indirect taxes, amounted for 1899 to 661,000 guilders (guilder equals 40.2 cents); the expenditure was 669,000 guilders, the deficit being supplied by the Netherlands. The estimated revenue and expenditure for 1900 were 609,000 guilders and 686,000 guilders respectively. The chief products are maize, beans, pulse, cattle, salt, lime, and woods. The imports of the island of Curaçao for 1898 amounted to 1,960,070 guilders. Curaçao has no export tax; the exports for the other islands amounted to 284,954 guilders. The trade of the islands is not flourishing, partly on account of the unsettled conditions in neighboring South American countries. In 1898, 2,323 vessels visited the islands. The best harbor is in Curaçao.

CURLING. The game of curling suffered no diminution in popularity in 1901. The total clubs enrolled in the Royal Caledonian Association numbered 671. The eleventh international match for the Gordon medal, between rinks of the United States and Canada, was won at Montreal February 5, 1901, by the Canadians, by a majority of 34 shots. The two other principal Canadian contests, the Victoria Jubilee trophy and the governor-general's prize, were both won by the Ormston rink; while Montreal won the Montreal AAA shield. In the United States the Dalrymple medal, North vs. South, was won by the North, 94-66. The \$500 gold Mitchell medal and the fourteenth club championship were won by the Van Cortlandt (N. Y.) Curling Club. The Gordon medal and twenty-ninth rink championship were won by the same club. The Hamilton medal and interstate match between the State of New York and New Jersey, were won by New York by a majority of 28 shots, and the second match for the Dewar challenge cup and four gold medals for the winning rink was won by the rink of the Caledonian Club.

CURRENCY. See BANKS—BANKING (paragraph Currency Questions).

CYCLING. The year 1901 was marked by the disappearance of the International Cycling Association, an organization formed by a union of the French Cycling Society and the Amateur Athletic Union of America. The organization was of little value. The conduct of all racing, and the keeping distinct the classes of amateurs and professional riders was placed with the National Cycling Association, and this system has worked well. This left the League of American Wheelmen free to attend to its legitimate function of watching and aiding the interests of the ordinary rider, especially in the way of road improvement. Wherever good roads have been procured, interest in cycling has been more than maintained, and such runs as the Irvington-Milburn road-run have drawn large numbers of wheelmen. The most notable step towards good roads was taken by the National Good-Roads Association and by the Illinois Railroad Company. The latter, at a cost of some \$80,000, sent a train equipped with the best road-making machinery, together with engineers and expert mechanics, on tour through the south and middle west to give practical demonstration of the value of good roads by actually building, rebuilding, or repairing quarter-mile sections at various points selected over a wide area. The most notable professional cycling contest was that which terminated at the Madison Square Garden, New York, December 14, 1901. This was a six-day race, and was carried out in pairs, since the law does not permit one man to be on the track more than twelve hours in a day. The first five pairs each covered 2,555 miles and 4 laps. The first pair, R. Walthour, of Atlanta, Ga., and A. McEachern, of Toronto, Canada, beat Wilson and Maya by 2 yards, and they in turn beat Munro and Newkirk, Babcock and Turville, and Butler and McLean, by 5 yards.

CYPRUS, an island in the eastern Mediterranean, 60 miles from the coast of Asia Minor, is a British colony, although, under the convention of 1878, it pays an annual tribute to the sultan. The area is 3,584 square miles, and the population in 1901 numbered 237,022, of whom 21.64 per cent. were Mohammedans and the remainder mostly members of the Orthodox Greek Church. The capital is Nicosia, an inland town, with a population (1901) of 14,752. The government is to some

extent representative. It is vested in a high commissioner (Sir W. F. H. Smith since 1897), an executive council, and a legislative council, partly elective. The revenue amounted in 1901 to £215,268, which was considerably above the average, and has only twice been exceeded since the British occupation. The expenditure in 1901 was £135,387, of which the greater part was spent for police and public works. On the whole since the occupation there has been an excess of revenue over expenditure of over £1,300,000, which, however, has been more than offset by the annual tribute of £92,800 payable to the Porte. There was a new local silver coinage in 1900 to supersede the imperial coinage in use. The imports in 1900 were valued at £289,962, and the exports at £264,851. Wine is the most important manufacture of the island, the production in 1900 being 3,750,000 gallons, of which 1,528,169 gallons were exported. The wheat crop in 1900 was over 1,500,000 bushels, and the barley crop over 2,000,000 bushels. With the exception of three high-schools for Greek Christians, and one for Mohammedans, the schools are of an elementary character, most of them receiving government aid. The enrollment in 1900 was 19,080. The building of a railroad from Nicosia to the coast, and extensive irrigation and harbor improvements were undertaken during the year, an imperial loan of £314,000 being advanced for the purpose.

CZECHS. See AUSTRIA-HUNGARY (paragraphs on History).

DAHOMEY, a French colony in Africa, situated on the Gulf of Guinea, between Togoland on the west and Lagos on the east, was extended northward in 1900 by the addition of the territories of Say and Nebba, or Kwala. It now reaches to the French military territories. The area is estimated at 60,000 square miles; the additions comprise about 10,000 square miles. The population is roughly estimated at 1,000,000, and consists mainly of negroes. The country is within the jurisdiction of the governor-general of French West Africa, and the seat of the general government is St. Louis, in Senegal. Local affairs, however, are administered by a governor and administrative council in Dahomey, at Porto Novo, a town of 50,000 inhabitants. The prosperity of the colony has rapidly increased; the local budget of 1900 balanced at 2,200,000 francs; whereas in 1897 France expended 1,735,000 francs on this colony. (The franc equals 19.3 cents.) The natives of the coast region are good farmers, and raise corn, manioc, yams, and potatoes, but the chief exports are coconuts and palm oil. Foreign commerce is in a flourishing state. In 1899 it amounted to 25,000,000 francs; in 1900 to 28,000,000 francs. Most of the increase was on account of imports. The main articles imported were: Beverages (4,328,000 fr.); tobacco (1,058,363 fr.); textiles (3,299,739 fr.); salt (361,208 fr.); and machinery (308,000 fr.). In 1901 the customs receipts were greater than those in 1900 by about 319,00 fr. The imports in 1900 amounted to 13,950,000 fr.; the exports to 14,300,000 fr. The greatest portion of the imports came from France; imports from Germany were second in importance; those of Great Britain were comparatively small. The railway from Kotonu to the Niger, proposed in 1900, was begun in 1901. On May 22, 1901, the formation in Paris of a corporation to build another railway was announced. The company was to be called La Compagnie Française du Chemin de Fer du Dahomey, and was to be chartered for 75 years. It was to have general headquarters in Paris. The capital was fixed at 8,000,000 fr.

DAIRYING, that branch of agriculture which pertains to the management of cows and the production of milk, butter, and cheese, has made great advancements in recent years, and there was no abatement in this respect in 1901. Increased attention is being given to the milk supply of cities, and its source, with the result that in most cities there has already been a marked improvement in the conditions surrounding the production and handling of milk for domestic use. Cleanliness, as well as quality, is at last receiving attention in milk inspection. There is every reason why a rigid inspection should be maintained of the dairies and stables from which the milk supply of cities comes, for its neglect is far more dangerous to the health of consumers than is the sale of watered or skimmed milk. There is a much greater call for certified or sanitary milk, produced by healthy cows kept under good sanitary conditions, and properly handled and bottled so as to make it a safe food of uniform richness. Such milk is usually certified to contain a given percentage of fat. The production of it has become an established industry in the vicinity of most large cities, and an increasing number of people, appreciating the dangers of impure milk, especially to children and invalids, are willing to pay the slightly advanced price which it commands. The ordinary milk supply of most cities still leaves much to be desired in the way of cleanliness and healthfulness. The milk supplied to many creameries is now superior to the ordinary supply of cities—by reason of the supervision which they exercise. Realizing the necessity of pure, wholesome, fresh milk for making butter of uniformly high quality, they insist upon the observance of certain rules of cleanliness and precautions in handling the milk by the patrons supplying it; and the practice of paying for the milk by test, i.e., on

the basis of its fat content, has become almost universal. So important a matter has this test become, that a number of States have recently legislated upon it, providing for an official inspection of the bottles used in making it, to insure their being properly graduated. The Babcock test, which is the one universally used, is becoming a more important factor in dairying every year.

With a view to bettering the export trade in dairy products and affording to exporters the benefit of government certification as to the quality and purity of their products, the Department of Agriculture has inaugurated an inspection, which for the present is confined to creamery butter and whole-milk cheese, and is made at the option of the exporters. The government stamp will be placed only on products which are pure and of such quality as to be a credit to the dairy trade, the purpose being to improve the reputation of American dairy products in foreign markets.

The most noteworthy investigations in dairy lines recently have been on the processes of cheese ripening. The rationale of these—the part played by the natural ferment in milk, galactase, and by the rennet which is added in the process of making and which has lately been found to have an important part in the subsequent ripening—have been worked out in the laboratory and in experiments on a practical scale; and it has been shown that these processes can all be carried on much more safely in curing-rooms kept at a low temperature, 50° or 55° F. At this low temperature the losses which result from the growth of injurious organisms are avoided, and the process of ripening, while requiring longer, is under the control of the cheese maker. Moreover, the flavor of the cheese is not impaired, as was formerly believed to be the case when a low temperature was used. The success of the discovery has suggested the establishment of control or cooperative curing-rooms at convenient shipping points, where the cheese factories of the section adjacent might send their green cheeses for curing. The plan is entirely practicable and would relieve small factories of the expense of maintaining the proper curing-rooms, and of the care of their product during the critical stage which has so much to do with determining its quality.

In butter making the use of pasteurized milk or cream, which is so common in Denmark, and of pure cultures for ripening the cream, has not come into general practice in this country, although it has been tried on a small scale in many places. It has, however, served to call attention to a very important step in butter making and led to much greater care in the preparation and use of the starter for cream ripening than was formerly the case, with the result that the average quality of the product has been improved.

Lindsey has published the result of six years' work on the effect of food on the quality of milk and butter, again confirming the conclusion that rich (protein) feeding does not have any permanent effect on the composition of the milk, but showing that the flavor, hardness, body, melting point, and other qualities of butter are influenced considerably by different kinds of feed, irrespective of their actual composition. A similar result has been reached by Hills in his extensive experiments in Vermont.

An extensive test of breeds of dairy cows was carried on at the Pan-American Exposition the past season. It included ten of the common breeds, with five representatives of each breed specially selected for the purpose, and lasted six months. In net profit on the butter fat produced, the Guernseys led, followed by the Jerseys, Ayrshires, Holsteins, Red Polled, Brown Swiss, French Canadian, Shorthorn, Polled Jerseys, and Dutch Belted, in the order named. In net profit on total solids (corresponding to the estimated cheese-making value of the milk), the Holsteins led, with the Ayrshires second. The Holsteins "made a great record and as milkers far surpassed any other breed." The Ayrshires made an excellent showing. One of the chief results of the test was in showing the impossibility of settling the merits of breeds by a breed test; the result all depends on the cows selected to represent the several breeds, and the skill and judgment with which they are handled, and in the end they are not convincing and are of very little permanent value.

Much more attention is being given to the quality of cows kept on dairy farms, and a material improvement in their milking qualities is constantly going on. It is stated as probable that the average cow throughout the country is not paying her board. It has been shown so often in tests of herds that one-half or more of the cows were not profitable, that this, coupled with the returns from the creamery, has led to systematic selection and breeding up of the herds by thoughtful farmers all over the country. The experiment stations have shown, furthermore, that the poor returns are often due to inadequate feeding and poor management. This, taken in connection with the high prices of commercial feeds, has led to more intensive methods in dairy farming, under which a larger proportion of the grain and other concentrated feeds are being produced on the farm. Indeed, in the East and in the neighborhood of cities where the value of land is high, the practice is becoming increasingly extensive of growing soiling crops, largely of legumes, for feeding dairy

cows, which are kept up instead of being turned out to pasture. In a number of States the experiment stations have worked out practical rotations of these green crops, which furnish a continuous supply of feed of unusual richness throughout the growing season. This system of soiling greatly reduces the area required for keeping a cow, and likewise the amount of feed which has to be purchased. The tendency toward it and toward better feeding and care in general, together with the improvement of the average cow, are among the most marked tendencies in good dairy practice.

DALY, WILLIAM HUDSON, American army surgeon, died by suicide, at Pittsburg, Pa., June 9, 1901. He was born near Blairsville, Pa., July 11, 1842, and was educated at Jefferson Medical College, Philadelphia, and at the medical department of the University of Michigan. Dr. Daly served through the Civil War as a surgeon in the Union army, and on the termination of his service settled in Pittsburg. At the outbreak of the Spanish-American War in 1898, he became surgeon, with rank of major, on the staff of General Miles, and in the autumn of 1898 made a report on the beef furnished to the American troops which led to the famous "embalmed" beef inquiry.

DAMS. The use of steel for engineering structures has been extended to include dams. Usually the steel is limited to thin plates, riveted together to form a continuous sheet, and placed in the midst of a mass of loose stone in the rock-fill type of dam. But in two instances steel plates alone, supported by steel trestles or framework, have been employed. In the Ash Fork dam, built in Arizona for the Atchison, Topeka, and Santa Fé Railway Company a few years ago, the steel plates extended the whole depth of the structure. In a dam built by two mining companies in 1900-01 across the Salmon Trout River, at Redridge, Mich., to furnish water to stamp mills, the lower part of the dam is of concrete and the upper of steel. The combined steel and concrete section is 464 feet in length, but this is flanked by concrete abutments, and beyond these earth embankments with concrete core walls, extend some distance in each direction, making a dam with a total length of 1,006 feet. The greatest height of the dam is about 74 feet, which is about equally divided on the up-stream side between the concrete base and the steel-plate superstructure. The concrete base is 54 feet thick, measured along the bed of the stream. The depth of the concrete is much greater on the up-stream than on the down-stream side, and has the same slope, on the water face, as the steel plates. The steel plates have a slope or batter of 8 feet horizontal to 12 feet vertical measurement, and extend downward over the sloping portion of the concrete. The A-shaped frames that support the main part of the plates rest on and are anchored into the concrete base. The plates are $3\frac{1}{8}$ inch thick where supported by the framework and half that thickness where they are backed by the concrete. They are covered with a protective coating and have riveted joints. The dam diminishes in height each way from the centre and is comparatively low at the abutments. The plate covering of this dam, like that at Ash Fork, Arizona, was designed by F. H. Bainbridge. The reservoir formed by the dam has an available storage capacity of 600,000,000 gallons, and the water required by the stamp mills is about 25,000,000 gallons a day. The water will not flow over the crest of the dam, but will be directed to one side through a channel and over a spillway. A fully illustrated description of this unique structure is given in *Engineering News* for August 15, 1901. In the issue of January 2, 1902, of the same journal, a rock-fill dam is described which has a steel core plate to a height of about 60 feet, above which the sloping rock-fill is faced, on the up-stream side, with a continuation of the same plate. The total height of this dam above the bed of the stream is 93 feet, but a thin concrete wall beneath and surrounding the lower part of the plate extends to rock, some 35 feet lower. The original dam, completed in April, 1899, was 68 feet high, but it was extended as described in 1901. As it now stands, the reservoir formed by the dam has an available capacity of 387,500,000 cubic feet—enough water to cover 8,900 acres to the depth of one foot. So favorable is the natural site for the dam that the structure is only 173 feet long at the top. The dam was built to develop a water supply for irrigation. It is located on East Canyon Creek, near Ogden, Utah, and is owned by farmers in the vicinity, who are organized as the Davis and Weber Counties Canal Company. Mr. W. M. Bostaph is the chief engineer of the company and was the engineer for the dam. In December, 1901, the company contemplated raising the structure to the height of 156 feet, which would increase the available capacity to about 1,000,000,000 cubic feet.

DANISH WEST INDIES, three islands of the Virgin group belonging to Denmark, lying to the eastward of Porto Rico, have a combined area of 138 square miles and a population estimated at slightly over 35,000. St. Croix, the largest, has an area of 84 square miles and a population of 19,783. St. Thomas, area 33 square miles, population 14,389; and St. John, area 21 square miles, population 984. The seat of government is at Christianstadt, in the island of St. Croix, where a

DANISH WEST INDIES.—A Group of Natives (Upper). A Public Place in St Thomas (Lower).

governor-general appointed by the Danish crown resides. Charlotte Amalie, on St. Thomas, is the only other city of importance. The inhabitants are largely negroes speaking a Spanish dialect. English is spoken to a considerable extent in the ports. The Danish population, which is very small, consists almost entirely of officials and their families. The colony has almost complete self-government, the legislative power being vested in two colonial councils, one for each of the two districts into which the colony is divided, three-fourths of whose members are elected, and whose powers are limited only by those of the royal governor, who acts chiefly in an executive capacity. The budget is controlled entirely by the councils. Two-thirds of the colonial revenue is derived from indirect taxes, largely import duties. The direct taxes have for years amounted to little because of the impoverished condition of the people. The tariff rate varies, averaging only 3 per cent. ad valorem in St. John and St. Thomas, and amounting to a high protective duty in St. Croix, where the competition of the United States is supposed to injure the agricultural industries. An export duty of 5 per cent. exists on sugar. Since 1870 the revenue has been insufficient to meet the expenditure, and for the past decade the annual deficit has fluctuated between \$100,000 and \$150,000, which has been covered by advances from the Danish government, amounting in 1901 to a total of over \$2,000,000. The budget figures for the fiscal year 1900-01 were, revenue, \$250,385, and expenditure, \$432,901, leaving a deficit of \$182,516. Sugar, which was formerly the staple product of the islands, is still exported to some extent, although the production is but a small fraction of what it once was. Rum and molasses are also manufactured for export. The trade is largely with the United States, which furnishes three-fifths of the imports (\$478,462 in 1901) and takes four-fifths of the exports (\$692,150 in 1901). The commerce of the islands with Denmark has been steadily falling off for years, the imports from the mother country having decreased from \$425,000 in 1883 to \$20,300 in 1899, and the exports to Denmark from \$98,000 in 1883 to \$25,000 in 1899.

Particular interest attaches to the islands from the fact that negotiations which have been in progress for two years past appeared at the close of 1901 to have resulted in an agreement on the part of Denmark to sell the islands to the United States for a sum approximating \$5,000,000. The first attempt on the part of the United States to purchase the islands was made in Lincoln's administration, when, in January, 1865, Secretary Seward made an informal offer of purchase to the Danish government. Negotiations followed, resulting in the signing of a treaty in October, 1867, by the terms of which this country was to pay \$7,500,000 for the two islands of St. Thomas and St. John. This treaty, although ratified by the Danish *Rigsdag*, was rejected by the United States Senate. Not until 1892 were negotiations again opened. They amounted to nothing at that time, but two years ago were begun for a third time. Several times during 1901 it was announced that negotiations had been broken off. A movement was started in the islands in opposition to the sale, and an elaborate scheme for promoting the islands' industries and diverting trade from American to Danish channels was reported to have been decided upon by a syndicate of Copenhagen merchants. A change in the Danish ministry delayed matters, but the evident desire of the government to be rid of a colony which had proved only a drain on the treasury of the home government finally overcame sentiment.

DARTMOUTH COLLEGE, Hanover, N. H., founded 1769, includes, besides the college proper, the Amos Tuck School of Administration and Finance, the Thayer School of Civil Engineering, and the Medical School. In 1901 the faculty numbered 71 professors and instructors, and the student body 686, of whom 23 were graduates and 663 undergraduates. The college offers three parallel courses, the classical, the Latin-scientific, and the scientific. By a gift of \$100,000 from Mr. Edward Tuck, provision has been made for the erection and maintenance of a building for the School of Administration and Finance, which is expected to be ready for occupancy in September, 1902. The library contains about 85,000 volumes and 20,000 pamphlets. During the last year a building was erected by the trustees for the social uses of the college, which will provide for 300 students.

DAUGHTERS OF THE KING, an order of religious service in the Protestant Episcopal Church, founded in 1885, has 734 chapters and 15,673 members, and in the Junior Branch 345 members in the 31 chapters. The order, found throughout the various dioceses of the church in the United States, extends also to Canada and England. At the convention held in San Francisco, October 5-8, a resolution was passed making subsequent conventions triennial instead of annual. The official organ is *The Royal Cross*. President, Mrs. E. A. Bradley; secretary, Miss Elizabeth L. Ryerson, 281 Fourth Avenue, New York City.

DAVIN, NICHOLAS FLOOD, Canadian M.P. and journalist, died by suicide at Winnipeg, Manitoba, October 17, 1901. He was born at Kilfinane, Ireland, January 13, 1843, and was educated at Queen's College, Cork. In 1868 he was called

to the London bar, but after practicing a short time he entered journalism and went to Canada in 1872, where he joined the staff of the *Toronto Globe*. After a short experience in this position he lectured for a year, then joined the staff of the *Toronto Mail*, leaving in 1874 to begin the practice of law. He went to the Northwest Territory in 1882, and in the following year established the *Leader*, the first newspaper to be published in Assiniboia. Upon the granting of representation to the Territories in 1887, Mr. Davin was elected to the House of Commons from West Assiniboia, a seat he held at the time of his death.

DAWSON, GEORGE MERCER, F.R.S., director of the Geological Survey of Canada, died March 2, 1901. He was born at Pictou, Nova Scotia, August 1, 1849, the son of Sir William Dawson, also a famous geologist and principal of McGill College, Montreal. The younger Dawson was educated at McGill College and the Royal School of Mines in London, receiving at the latter institution a thorough scientific training at the hands of such professors as Ramsay, Huxley, Etheridge, Frankland, and Percy. On his return to Canada he was occupied with mine surveying and educational work until 1873, when he was appointed geologist and botanist to the British North American Boundary Commission, then engaged in the location of the boundary between Canada and the United States. On this expedition he accumulated much scientific material, and in 1875 published a *Report of the Geology and Resources of the Country in the Vicinity of the 49th Parallel*, and prepared other reports and memoirs dealing with various geological and zoological conditions of this region. In 1875 he was appointed to the Dominion Geological Survey, and became its director in 1883. He was a thorough explorer and made many trips through British Columbia and the Northwest Territories, examining the mineral deposits and locating the prominent features of the country. So thorough was Dr. Dawson's acquaintance with the geography and resources of Canada that he was chosen as a British commissioner at the time of the Bering Sea arbitration, and prepared a report dealing with the conditions of seal life from actual observations made during the summer of 1892. The report and Dr. Dawson's arguments were considered an important feature of the British case, and he was rewarded by being made a companion of the Order of St. Michael and St. George. His academic and scientific honors were even more marked. He held the degrees of D.Sc. from Princeton and LL.D. from Queen's University and McGill University. In 1891 he was made a Fellow of the Royal Society and received the Bigsby medal of the Geological Society of London. His high scientific attainments led to his election as president of the Royal Society of Canada, and when the British Association for the Advancement of Science held its meeting at Toronto in 1896, he was president of the Geological Section. In 1900 Dr. Dawson was president of the Geological Society of America, an organization of the geologists of the United States and Canada. He was the author of many valuable reports and papers, published not only by the Dominion government, but by various learned societies of America and England. His successor as director of the Canadian Geological Survey is Dr. Robert Bell (*q.v.*).

DEATH-RATE. See VITAL STATISTICS.

DELAWARE, an eastern State of the United States, has an area of 2,050 square miles. The capital is Dover. Delaware was one of the original thirteen States. The population in 1900 was 184,735, while in June, 1901, as estimated by the government actuary, it was 187,000. The populations of the two largest cities in 1900 were: Wilmington, 76,508, and Newcastle, 3,380.

Industries.—Although Delaware is an agricultural State, the census reports of 1900 show a steady increase in manufacturing interests since 1850. During this time the population increased from 91,532 to 184,735, or more than 100 per cent., while the average number of industrial wage-earners increased from 3,888 to 22,203, this latter number representing 12 per cent. of the total population. The amount of actual capital invested in 1900 in mechanical industries, exclusive of capital stock, was \$41,292,267; the gross value of the products was \$45,437,490, while the net value, exclusive of products re-used in the process of manufacture, was \$29,573,449.

The industries of Delaware depend largely upon two factors: Its geographical position and its extensive orchards. Numerous railways bring the coal and iron fields of Pennsylvania within easy reach and render the markets of Philadelphia and Baltimore accessible to the completed products, while good harbors at Wilmington, Newcastle, and Lewes, and the navigability of the Delaware River and Delaware Bay encourage coastwise and export trade. The abundance and excellence of the fruit grown have resulted in a striking development of the fruit canning and preserving industry, the value of the product of which has more than doubled in the last decade.

The principal manufacturing industries of the State are those in which iron, steel, or their products are the chief materials. These industries embrace steel and

rolling mills, car shops, foundry and machine shops, and shipbuilding plants. In 1900 the product of these was valued at \$13,953,379, being 30.7 per cent. of the total value of the products of the State. The next industry in importance is the tanning, currying, and finishing of leather, with a product in 1900 valued at \$9,400,504, more than double the value of 1890. The most remarkable development has been shown in the canning and preserving industry. In 1900 the product was valued at \$1,570,790, an advance of 112.2 per cent. in the decade. Other manufactures of importance are fertilizers, valued at \$738,703, a decrease of 28 per cent. since 1890, and cotton and woollen goods valued at \$920,828, a decrease of over 40 per cent. since 1890. The decline of the latter industry, founded early in the century, is worthy of note.

Agriculture.—Delaware is preeminently a fruit-growing State. Improved farm lands occupy 60.8 per cent. of its entire area, a larger proportion than in any other State on the Atlantic coast. Indeed, only four States in the country, all in the North Central group, have a proportion of improved land in farms greater than that of Delaware. It seems to be the natural home of the peach, while apples and small fruits, as strawberries, raspberries, etc., are also raised in abundance. Delaware, New Jersey, and Maryland supply about seven-tenths of the demand for these products in the New York and Philadelphia markets.

Legislation.—The session of the Delaware legislature which met in January, 1901, was principally occupied in endeavoring to elect two United States senators. (See paragraph Senatorial Conflict.) This attempt failed, however, and the legislature adjourned on March 8. The original intention had been to adjourn on March 1, but the time was delayed until after the expiration of Senator Kenny's term on March 4, in order that under the decision of the Senate in the Quay case in 1900, a vacancy should not happen during the recess of the legislature and make it possible for the governor to appoint a senator. Of the few acts passed by the Delaware legislature in the intervals of the senatorial conflict, one of the most interesting was the ratification on February 12, 1901, of the Thirteenth, Fourteenth, and Fifteenth amendments of the Constitution of the United States. Although Delaware was the first State to ratify the national constitution, it was the last to ratify these amendments, and prior to this act colored people had to make affidavits to the justice of the peace that they were free before they were allowed to marry. Notwithstanding that Delaware could not elect a senator, a resolution favoring the election of senators of the United States by a direct vote of the people was rejected by it. A ballot law was passed, in curiously exact antithesis to a ballot law enacted by Maryland in the same year. (See article MARYLAND, paragraph Ballot Law.) The Delaware law created the office of "voters' assistants," and provided that two assistants, one to be appointed by each party in each precinct, might assist voters to mark or change their ballots or to fold them or read to the voter the names of the candidates on the ballot. Other acts of the Delaware legislature were as follows: An act making kidnapping punishable by death or imprisonment for life, at the discretion of the court; an act creating a State library commission for the State of Delaware, to have general control and supervision of all free and circulating and traveling libraries in the State, and authorizing the establishment of a free library in any city or town upon the affirmative vote of the electors; an act prescribing that all oleomargarine made in imitation or semblance of pure butter should be plainly labeled "oleomargarine," "butterine," or whatever it might actually be; an act amending the general corporation act of 1899; an act appropriating \$12,000 for the erection of proper school buildings for the colored people, as the existing schools were asserted to be in an unfit and unsanitary condition, and the colored people had not the means to improve them; an act receiving commendation from many quarters, and especially indorsed by justices having jurisdiction over that class of cases, provided that wife-beaters should in the discretion of the court be not only fined and imprisoned, but should also be whipped to the extent of not more than 30 lashes and not less than 5.

Corporation Laws.—An act was passed providing for the taxation of the franchises of all telegraph, telephone, express, sleeping-car, and palace-car companies, pipe-line and gas companies, and insurance companies organized under the laws of the State. The tax was to vary in amount with the different forms of companies, and was to be a per cent. of the gross receipts of the company from business done in the State, or else a certain per cent. of the dividends, or both. And if any corporation did not pay its tax, an injunction might be obtained by the State to prevent the company from exercising its franchise, or to vacate the franchise if the company still persisted in refusing to pay taxes. A constitutional amendment was proposed to the effect that in the constitution adopted in 1897 that clause should be struck out which provided that in all elections for directors of corporations, each share of stock should be entitled to one vote, and that that clause also should be struck out which provided that stock should only be issued for money or adequate property. It was further proposed that there should be inserted in the constitution

the clause that "shares of the capital stock of corporations created under the laws of this State, when owned by persons not residing therein, shall not be subject to taxation by any law now existing or hereafter enacted."

Delaware-New Jersey Boundary Question.—At the suggestion of Governor Hunn, the Delaware legislature instructed the attorney-general to take necessary legal steps to protect the rights of the State in the boundary dispute with New Jersey. The contention between the two States in this matter grew out of the arrest of some Delaware fishermen who were fishing along the New Jersey shore opposite New Castle in 1871. Delaware claimed sovereignty over the Delaware River to the low-water mark on the New Jersey shore opposite New Castle, and distant from the court house in New Castle not more than 12 miles. New Jersey, on the other hand, claims jurisdiction of all the river east of an imaginary line drawn down the centre of the stream. The litigation is now on the calendar of the United States Supreme Court.

Senatorial Conflict.—The main interest of the session of the Delaware legislature, which met on January 1, 1901, and adjourned on March 8, was centred in the attempt of Mr. J. Edward Addicks to have himself elected to the United States Senate. This senatorial ambition of Mr. Addicks dates apparently from 1889, when he became a citizen of Delaware. At that time the legislature was Republican for the first time since the Civil War, and Mr. Higgins (Rep.) was elected to the Senate. From that year on Mr. Addicks displayed great energy in developing the Republican strength of the State; he worked especially in counties that had previously been heavily Democratic, and by devoting himself somewhat exclusively to these counties built up a political machine for himself independent of that of the regular State Republican organization, which thereupon became antagonistic to him. In 1893, when another senator was to be elected, the State legislature was Democratic, and Mr. George Gray (Dem.) was elected to the Senate. In 1895, however, the State was again Republican and Mr. Addicks demanded that he should represent Delaware at Washington. Through his personal following in the legislature, Mr. Addicks held the balance of power between the Democrats and the regular Republicans, and as neither party was strong enough to elect a senator without Mr. Addicks, and as Mr. Addicks' sole campaign platform was "Addicks or nobody," the senatorial vacancy was not filled until 1897, when the legislature was again Democratic and Mr. Kenney (Dem.) was elected for the remainder of the term ending March 4, 1901. In 1899 the State again gravitated to the Republicans and the expiration of the term of Mr. George Gray left a senatorial vacancy to be filled. But again the cry was raised of "Addicks or nobody," and for the second time the Republican majority was unable to agree upon a candidate. In the meantime Mr. Addicks had carried his case, in 1896, before the Republican national convention at St. Louis. Two sets of State delegates went to this convention, one representing Mr. Addicks and the other the regular organization, headed by Mr. Du Pont and Senator Higgins. The Du Pont-Higgins delegates were seated at this time, thus throwing the weight of the Republican party against Mr. Addicks. But Mr. Addicks, still persevering, carried the same question before the national convention of 1900 in Philadelphia, and this time the convention proposed to seat representatives of both sets of delegates. When the Du Pont men refused to accede to this, the Addicks men were seated. In the legislature elected in November of that year, the Republicans had 29 votes on a joint ballot, 9 in the senate and 20 in the house, while the Democrats had a joint ballot of only 23, 8 in the senate and 15 in the house. This legislature had to elect not one senator, but two; for there was one vacancy extending from 1899, and the term of Mr. Kenney also would expire on March 4, 1901. The Addicks men endeavored to compromise matters with their opponents in the legislature, and especially with seven Republicans who were united in their utter opposition to Mr. Addicks, and offered to permit any man representing the regular, or Du Pont Republicans, to be elected for the short term of the Senate expiring in 1905 if the Du Pont delegates would turn around and elect Mr. Addicks senator for the long term expiring in March, 1907. It was understood also that this view of the case was indorsed by the Republican national committee, and Senator Marcus A. Hanna, as its chairman, was reported as saying that Mr. Addicks, by making Delaware at least a doubtful, if not a regular, Republican State, was fully entitled to the senatorship. On February 8, however, the Du Pont Republicans finally declined any proposition looking to the election of Mr. Addicks, and from that time on futile ballots were taken daily until the legislature adjourned on March 8. It had been the original intention of the legislature to adjourn on March 1, but it was known that the governor, Mr. John Hunn, was favorable to Mr. Addicks, and under the ruling of the Senate in the Quay case in 1900 to the effect that a governor could not appoint a senator if a vacancy "happened" while the legislature was in session, it was deemed wise not to adjourn until after Senator Kenney's term had expired on March 4. Even then the sudden adjournment

of the legislature *sine die* on motion of the Du Pont Republicans came as a most unwelcome shock of surprise to the Addicks delegates, who had persisted in believing that some compromise would be finally effected if they would but have patience. Never before in the history of the country had a State been left totally unrepresented in the Senate through the inability of its legislators to agree upon a candidate. And this fact, when taken in conjunction with the long deadlocks in Nebraska (*q.v.*) and the more reprehensible swiftness of election, as was alleged, in the Pennsylvania (*q.v.*) legislature, strengthened the popular demand in the United States that senators should be elected by direct votes of the people and that a constitutional amendment should be passed to that effect. (See UNITED STATES, paragraph Election of Senators.) As to the merits of the Addicks matter, it was pretty generally alleged that Mr. Addicks had spent money without stint for six years solely to get himself elected, and that his election would have been a national disgrace. On the other hand, it was pointed out that Mr. Addicks had had much less ability to do actual harm, owing to the relative unimportance of Delaware's industrial resources, than some senators regularly elected from other States, and that in fact Mr. Addicks had done comparatively little harm, and that his turning the State from giving a regular Democratic majority to giving a regular Republican majority merited recognition.

State Officers.—Governor, John Hunn, Republican, elected for four years, term expires in January, 1905; lieutenant-governor, Philip L. Cannon; auditor, Purnal B. Norman, Jr.; treasurer, Martin B. Burris; attorney-general, Herbert H. Ward; commissioner of insurance, George W. Marshall.

Supreme Court: Chancellor, John R. Nicholson, Dem., term twelve years, expires June, 1909; chief justice, Charles B. Lore, Dem., term twelve years, expires June, 1909; associate justices, Ignatius C. Grubb, Dem., W. C. Spruance, Rep., James Pennewill, Rep., and William H. Boyce, Dem.

Congressional Representatives (57th Congress).—In the House: L. H. Ball, Republican, from Faulkland. In the Senate: Terms for both senators have expired, that of Richard Rolland Kenney in 1901 and that of George Gray in 1899, and no senators have been elected to their place.

DENMARK, a constitutional monarchy of Europe lying to the north of Germany. The capital is Copenhagen.

Area and Population.—The total area of Denmark, which embraces the peninsula of Jutland, certain islands in the Baltic, and the Faroe Islands, is 15,289 square miles. On February 1, 1889, the population, exclusive of the Faroe Islands, which had 12,955 inhabitants, was 2,172,380. According to the census of February 1, 1901, the population showed an increase of 275,061, the total being 2,447,441. Accordingly, the average annual increase during the decade was 1.09 per cent. As the population in 1801 was 929,001, the increase during the century was 163 per cent. The last census showed a rural population of 1,474,501, as against 1,416,213 in 1890, and an urban population of 972,940, as against 756,167; the former, therefore, showed an increase of 4.1 per cent. and the latter 28.7 per cent. In 1890 Copenhagen had 321,418 inhabitants, while in 1901 the population of the same territory was 378,280, a gain of 17.7 per cent.; meanwhile, however, certain districts were annexed to the city, so that in 1901 its total population was 389,131, while its suburbs had 102,209 inhabitants additional.

Emigration, which is chiefly to the United States, is small, the number of emigrants in 1899 being 2,799. Religious toleration prevails, though Lutheranism is the state religion. Elementary instruction is free and compulsory; there are about 3,000 elementary schools, with about 310,000 pupils in attendance.

Government.—The executive authority is vested in the king, who is assisted by a ministry of eight members, appointed by him and responsible to the lower house of parliament. This body, the *Rigsdag*, is bicameral, consisting of the *Landsting*, or upper house, and the *Folkething*, or lower house. A part of the members of the former are appointed by the crown and a part are chosen by certain electoral bodies; members of the latter are elected by popular vote. The reigning sovereign is Christian IX., of the house of Schleswig-Holstein-Sonderburg-Glücksburg, who ascended the throne in November, 1863. The heir apparent is his son, Prince Frederick, who was born in 1843. On July 17, 1901, the Conservative ministry of M. Hannibal de Sehested, who was appointed premier on April 27, 1900, resigned, and on the 23d of the month Professor J. U. Deuntzer formed a new ministry, of which all the members represented the Left. See the paragraphs on History.

Army and Navy.—All able-bodied men on reaching the age of 22 years are liable to service in the regular army. This force in 1900 numbered 824 officers and 8,945 men; the war strength is about 1,450 officers and 60,000 men. The navy comprises 5 coast defense armorclads, 6 third-class cruisers, 7 gunboats, 34 torpedo boats, a turret ship, a barbette ship, and 2 torpedo ships. The *Herluf Trolle*, an armored ship of 3,470 tons and a speed of nearly 16 knots, was launched in 1899, and a sister

ship is now building. A third-class battleship of 5,000 tons was laid down in 1901.

Finance.—The monetary standard is gold, and the unit of value the krone, worth 26.8 cents. The revenue and expenditure in kroner for fiscal years ending March 31 have been: 1899, 71,193,060 and 76,259,212 respectively; 1900, 72,561,487 and 77,509,052 respectively. The estimated revenue for the fiscal year 1901 was 72,820,278 kroner and the estimated expenditure 71,464,566 kroner; similar figures for 1902 are 73,662,225 kroner and 72,673,602 kroner respectively. The largest items of revenue in the latter budget are indirect taxes (mainly customs and excise), 51,117,400 kroner, and direct taxes, 10,816,700 kroner, while the largest items of expenditure are for the army, 10,947,694 kroner; the navy, 7,867,305 kroner; charges on the debt, 7,170,500 kroner; for the ministry of public worship and instruction, 7,511,587 kroner; the interior, 7,189,448 kroner, and for extraordinary state expenses, 11,100,172 kroner. The estimated revenue and expenditure for the fiscal year 1903 are 72,900,000 kroner and 72,400,000 kroner respectively. On March 31, 1900, the total public debt amounted to 207,419,912 kroner, of which 138,512,250 kroner were owed abroad. A year later the total debt had increased by about 10,000,000 kroner.

Industries and Commerce.—Nearly one-half of the inhabitants live by agriculture and one-fourth by commerce and manufactures. The principal crops are beets, oats, barley, rye, potatoes, and wheat. The estimated value of the grain and hay crops in 1899 was about 318,000,000 kroner, some 10,000,000 kroner less than in the preceding year. Crop values in 1900 somewhat appreciated, but less activity was noted in manufacture. The general imports and exports in 1899 (exclusive of the precious metals) amounted to 492,079,000 kroner and 364,521,000 kroner respectively, as against 462,219,000 kroner and 326,361,000 kroner in 1898. In the special trade the imports in 1899 were valued at 399,800,000 kroner and the exports 270,129,000 kroner. The values of the leading imports in 1899 were, in kroner: Cereals, 73,509,000; textile manufactures, 55,221,000; metals and hardware, 47,224,000; coal, 35,346,000; wood and wood manufactures, 47,224,000. Similar figures for the most important exports of home produce were: Pork, butter, eggs, and lard, 190,103,000; animals, 19,445,000; cereals, 9,148,000; metals and hardware, 3,405,000; the export of fish and fish products amounted to 8,314,000 kroner. The leading countries in the import trade in 1899 were: Germany, 144,253,000 kroner; Great Britain, 100,519,000 kroner; the United States, 78,146,000 kroner, and Norway and Sweden, 59,117,000 kroner. The most important countries receiving Danish exports were: Great Britain, 216,415,000 kroner; Germany, 66,673,000 kroner; Norway and Sweden, 46,121,000 kroner; Russia, 16,209,000, and the United States, 6,852,000 kroner.

Communications.—In 1900 the Danish railways had an aggregate length of 1,711 miles, of which 1,108 miles belonged to the state. The total cost of the state railways up to March 31, 1900, was 237,025,353 kroner. At the beginning of that year the state telegraphs aggregated 3,068 miles of line, with 9,367 miles of wire and 170 offices. The railway and private telegraph offices numbered 304. There are over 850 post-offices.

HISTORY.

Under European constitutional government it is customary for the crown, upon the resignation of a ministry failing to receive the support of the lower parliamentary house, to select a new ministry from the party having a majority in that body. This method, however, was not recognized in Denmark until 1901. Excepting a ministry in 1859, which lasted only a few weeks, the Danish ministries have always represented the Right, that is, the conservative political elements, although upon the revision of the constitution in 1866 the electorate began to favor the Left, and as long ago as 1872 the Liberals secured a majority of 27 in the *Folkething*, or lower chamber. The king insisted upon Conservative ministries, not only because he favored the Conservative party himself, but because he did not wish to admit the principle that a ministry should represent a parliamentary majority. The *Lands-thing*, or upper chamber, has always been Conservative. Consequently, for many years there has been friction between the administration and the *Landsting* on the one hand and the *Folkething* on the other. The conflict was carried on in various ways, a not infrequent method of the *Folkething* being its refusal to vote the budget. But notwithstanding the long and increasing spirit of disagreement between the administration and the popular legislature, the king never lost the good will of the people. The friction culminated in 1900 and 1901, and finally brought about what was heralded as a new era for Denmark. The principal events leading up to this change were as follows.

At the end of 1900 there was much confusion in the *Rigsdag* over the question of tax reform. In the preceding September a parliamentary commission had presented a reform programme which the *Folkething* adopted, but which, to the disappointment even of many Conservatives in the *Landsting*, the ministry refused to accept. The government brought forward tax proposals of its own, and on

December 5, 1900, another commission was appointed (by the *Landsting*) to consider the taxation question. The government had against it a large majority in the *Folkething*, and it could hardly count on a faithful majority in the *Landsting*; but this majority, though not very considerable, was skillful. For the report of the *Landsting* commission, while differing considerably from the plans adopted by the *Folkething*, also differed from the government's ideas, but in the main expressed the latter. Thus the government was enabled to side with the majority in the *Landsting*. This majority, moreover, was not reactionary; the proposals of the commission in a certain measure were even radical, demanding the abrogation of the heavy and unjust taxes on landed property in favor of taxes based on actual values. From the point of view of politics the proposals of the *Landsting* were cleverer than those of the *Folkething*. In particular the abolition of certain taxes and the introduction of new ones were preferable to the *Folkething* plan, which recommended the transfer from the state to the communes of certain taxes, whose actual assessment, however, should be as before. The proposals of the *Landsting* were also favorable to agrarian interests, which were dominant in both chambers; for members of the *Folkething* are chosen largely by the farming classes, while the *Landsting* wishes to retain the influence of the great landed proprietors. Thus the proposals of the *Landsting* seriously embarrassed the leaders of the Left, who had expected reactionary plans and found instead liberal measures which made greater concessions to agricultural interests than those proposed by themselves. The *Folkething* accordingly adopted the essential proposals of the commission. But agreement, at least superficial, which was so nearly reached, failed of final accomplishment; for a new commission, appointed in the middle of March (1901), and composed of 15 members from each chamber, came to no decision, and on the 31st of the month the parliamentary session closed after long and apparently fruitless debates.

It was not fiscal questions alone that had taken parliamentary attention or provoked friction in the *Rigsdag*. The Danish judicial system called forth a considerable amount of discussion, and inquisitorial procedure in the courts was attacked as being an anachronism in a country where representative government exists. Certain instances of alleged injustice were brought forward in the *Folkething*, but the minister of justice pointed out that that body was constitutionally incompetent to criticise in the matter of judicial decisions. This statement, though unquestionably correct, was unfavorably received by the Left, and the Socialists demanded a reform of judicial procedure, particularly with regard to criminal cases. Although the minister stated that he was ready to propose such a law as soon as possible, and would probably have presented it in the present session had not the members taken up so much time with economic questions, the *Folkething* passed a vote of censure by a large majority. There was also considerable friction in Denmark between the Liberal and Conservative elements, arising from what the former believed to be the unjust treatment by the government of certain officials who favored Liberal ideas.

These various points of disagreement made it certain that a Liberal victory would result in the elections of April 3, 1901. These elections were noteworthy in that for the first time the secret ballot was used. In the last *Folkething* the Right had 16 seats; in the new the number was reduced to 9, while the Moderates were reduced from 21 to 15. On the other hand, the Left Reformist party increased its members from 63 to 74 and the Socialists from 12 to 14.

The overwhelming defeat of the Conservatives led the old king—he was 83 in 1901—to approve the formation of his first Liberal ministry. This action was regarded as one of great constitutional significance, being the recognition on the part of the king of ministerial responsibility to the *Folkething*. Upon the king's request the ministry of M. de Sehested, who came into power April 27, 1900, resigned, and Professor J. U. Deuntzer, of the University of Copenhagen, on July 23 completed the formation of a new ministry, composed entirely of the opposition, as follows: Premier and minister for foreign affairs, Professor Deuntzer; the interior, M. Everold Sørensen; justice, M. Alberti; finance, M. Hage; war, Colonel Madsen; marine, Admiral Jöhnke; public instruction, M. Christensen; agriculture, M. Ole Hansen; public works, M. Hörup. M. Hörup is the editor of *Poliken*, an important radical organ of Copenhagen. As he is a leading advocate of the alliance between the Left and the Socialists, his presence in the cabinet seemed to indicate that this alliance would continue for some time, although M. Alberti has long been an enemy of socialism. With the exception of M. Hage, the members of the new ministry represent the common people. On September 1, 1901, a large delegation of Liberals assembled in Copenhagen and presented an address of thanks to the king for appointing a ministry representative of the popular mind.

The *Rigsdag* convened on October 4, 1901, and for the first time since 1884 was opened by the king in person. The ministerial programme included tax reform,

improvements in the judicial system, a more adequate and suitable system of defense, industrial and ecclesiastical improvements, and the better development of communal affairs.

For the colonies of Denmark, see **DANISH WEST INDIES, GREENLAND, and ICELAND.**

DE PUY, WILLIAM HARRISON, American clergyman and editor, died at Canaan, Conn., September 4, 1901. He was born at Penn Yan, N. Y., October 31, 1821, and was educated at Genesee College (now Syracuse University). Entering the Methodist ministry in 1845, he remained in pastoral work until 1848. In 1851 he was made professor of mathematics and natural history at the Genesee Wesleyan Seminary, and from 1855 to 1865 filled various pulpits at Buffalo, N. Y., in the latter year becoming associate editor of the *Christian Advocate*, in which position he remained for 25 years. He wrote *Three Score Years and Beyond* (1877); a *Compendium of Useful Information* (1878); and was editor of the *People's Cyclopaedia* (1879) and of the American Revision of the *Encyclopædia Britannica* (1891).

DESIGN, NATIONAL ACADEMY OF, located at Amsterdam Avenue and One Hundred and Ninth Street, New York City, has the following classes in full operation: The Free School of the Academy—Antique classes, drawing from casts, have three sessions, morning, afternoon, and evening; Competition class, meeting every two weeks; Sketch class, where students pose in turns daily. There are special classes maintained under the direction of the academy for the benefit of advanced students, viz.: Life classes, drawing from living model; Painting classes, painting from living model (head); Still-Life class, painting from still life; Etching class, once every week, and Illustration class, for men and women. The Free Antique classes are open daily from October to May, Sundays excepted. Admission to the Free School is obtained through the examinations held the first week in October and February of each year. Applicants for the examinations must register at the office of the Academy during the last week of September or January. All applicants are required to make a drawing from the antique, to be submitted to the committee for approval. The class in coin and medal designing, die-cutting, etc., is under the joint patronage of the American Numismatic and Archaeological Society and the National Academy of Design, its purpose being to impart to pupils the necessary knowledge to enable them to produce artistic coins and medals. Instruction is also given in ornamental designing and modeling in relief. The Woodbury and Langdon prizes, amounting to \$100, are available for work in this class, and are offered for the most creditable progress made during the school year ending in May, 1902. Other prizes are the Suydam and Elliott medals in silver and bronze for the best drawing in the life and antique schools, figure and head classes. The Hallgarten money prizes in painting and composition; painting, first prize, \$60; second prize, \$40; composition, first prize, \$60; second prize, \$40. The Albert H. Baldwin prizes in etching class, first prize, \$30; second prize, \$25. The awards of prizes, however, are subject to the application of a resolution passed by the council in May, 1898, to the effect that the council has reserved the right to withhold all or any of the prizes if the merit or quality of the work in competition does not justify the award. Students are liable to dismissal at the option of the school committee for irregular attendance. The National Academy of Design was founded in 1826 and has now a membership of 167, made up of 96 academicians and 71 associates. President, Frederick Dielman; secretary, H. W. Watrous.

DESJARDINS, ACHILLE-ARTHUR, French judge and publicist, died in Paris, January 17, 1901. He was born at Beauvais, November 8, 1835, and studied law at Paris, receiving his degree in 1858. He was appointed advocate-general at Aix, 1864; attorney-general at Douai in 1873, and at Rouen in 1874, and became advocate-general of the Court of Cassation in 1875. He was also a member of the Academy of Sciences from 1882, and an officer of the Legion of Honor from 1892. M. Desjardins was an eminent writer on international law and other legal subjects, some of his works being, *De l'aliénation et de la prescription des biens de l'état, des communes et des établissements publics* (1862); *Les Devoirs* (1865); and *la Nouvelle Législation de la presse* (1867). In the Dreyfus affair his vote finally went for a revision of the case, although he was originally opposed to it.

DIPHThERIA. The employment of the antitoxin treatment of diphtheria became more general in 1901, and but few dissenters from the prevailing opinion remain. Antitoxin has reduced the mortality one-half, in the cases in which it is used early. Prompt injection of maximum doses, repeated according to individual conditions, gives almost uniformly good results. Escherich, in the *Berliner Klinische Wochenschrift*, 1901, No. 2, p. 38, recognizes three varieties of diphtheria, as stated

in the following translation in the *Philadelphia Medical Journal*: "(1) The local variety, with slight susceptibility to the action of the toxin, and locally limited superficial predisposition; (2) the progressive variety, with slight susceptibility to the action of the toxin, extensive superficial predisposition, and extension to the passages; (3) the toxic-septic variety, (A) with marked susceptibility to the action of the toxin, and circumscribed local lesions (hypertoxic variety), (B) with marked susceptibility to the action of the toxin and local mixed infection, (a) with pyogenic cocci (phlegmonous, necrotic, septic variety), (b) with putrefactive processes (fetid variety), (c) with gangrene (gangrenous variety), (d) with the hemorrhagic diathesis (hemorrhagic variety). An analysis of the cases under observation, classified according to this plan, shows that in the preantitoxin period, from 1890 to 1894, there were treated 115 cases of diphtheria, with a mortality of 45.2 per cent. Of these cases, 30 were classified as localized, 74 as progressive (croup), 11 as septic-toxic, the mortality in each group being, respectively, nil, 55.4 per cent. and 100 per cent. In the succeeding (antitoxin) period, from 1894 to 1899, there were treated 1,147 cases, with a mortality of 13.08 per cent. Of these, 593 were localized, 378 progressive, 176 septic-toxic, and the mortality was, respectively, 0.17 per cent., 19.58 per cent., and 42.62 per cent." See ANTITOXIN and VITAL STATISTICS.

DISCIPLES OF CHRIST. The CHRISTIAN CHURCH, the followers of which are known popularly as Campbellites, or Campbellite Baptists, a name derived from that of their leader, originated in Kentucky in a movement for Christian union on the basis of a pure New Testament church in 1804, and dates its organization from 1827. Since that time a remarkably rapid growth has placed the church among the leading denominations of the United States, in 1901 ranking sixth. It has 1,179,541 members, 10,680 churches, with a property valuation of \$18,786,946, and 6,385 ministers, and 8,002 Bible schools in which are enrolled 744,450 members—statistics which present a material growth also in the past year. In addition to this constituency, there are 12,100 Disciples in Canada, 13,874 in Australia, 14,000 in Great Britain, and 95,000 in the foreign missionary fields. For 1901 contributions aggregated \$6,332,872, of which \$611,220 were devoted to missionary enterprises through the agency of the various societies and boards, and the remainder to educational work and other benevolences. The church controls, besides a number of female colleges and secondary institutions, 21 colleges and universities, attended by 5,522 students, of whom 801 are theological students, with libraries aggregating about 75,000 volumes, and having endowment of \$1,602,000 and property valued at \$1,717,500. Its publishing activities include 58 State and national religious journals. The Christian Church is known for its enterprise along lines of sectarian education and of missionary extension, the completeness of organization in the latter field being illustrated by 43 State and Territorial organizations (besides auxiliary bodies in cities and districts, each city, district, State, and national society having at least one convention during the year), and a National Foreign Christian Missionary Society, American Christian Missionary Society, and Christian Women's Board of Missions. The third annual congress of the church was held March 26-28, 1901, at Lexington, Ky. The central theme discussed was "Evolution" in its various phases of relation to Christian faith, to religion, and to the doctrine of redemption. A feature of the congress was a movement for a national education society, and another, of interest as the first of its character here, was in behalf of an international federation of religious bodies, the scheme, as projected, aiming to create an international church, the affiliation of individual churches to be based on a platform of common interest, though each body, an auxiliary to a general congress, would retain its prevailing creed. The number of the usual summer assemblies of Disciples, which are held in Indiana, Illinois, Virginia, and Kentucky, was increased by the dedication on July 4, of a tabernacle in a new religious resort on the Delaware coast which was named Bethany Beach. At the national convention in Minneapolis, in October, 1901, attended by some 3,500 delegates, the reports of the various missionary societies were rendered, indicating a year of progressive activity, and plans for the ensuing year were formulated. The organization of a considerable number of new churches and the addition of 25,000 new members were reported as the result of the year's work in the domestic department, while in the foreign fields, additional work was undertaken in Africa and the Philippines. There are now stations in 12 foreign lands, on every continent except South America, and a force of 275 missionaries, including native helpers. Educational and medical work and special interest in the care of the famine sufferers of India are features of the foreign missionary enterprise of the church. The national convention of 1902 will meet in Omaha.

DISTRICT OF COLUMBIA. The seat of the government of the United States, co-extensive with the city of Washington. It was formed March 30, 1791, by a cession of land, amounting to 100 square miles on both sides of the Potomac River, to the United States by the States of Maryland and Virginia. It formerly comprised two counties, Alexandria and Washington. Alexandria County, however,

was re-ceded to Virginia on July 9, 1846, and in 1874 the county government of Washington was abolished. The total land area of the District is approximately 60 square miles. The population in 1890 was 230,392, and in 1900, 278,718, while in 1901 it was estimated at 283,718.

Government.—The present government of the District of Columbia was instituted in 1878, when the administration of the District was given by act of Congress to three commissioners, two of whom are appointed by the President of the United States from citizens of the District having three years' residence therein, while the third is detailed by the President from the corps of engineers of the United States Army. The citizens of the District have no voice or vote in the government. The commissioners appoint all the subordinate municipal officers. The present commissioners are Henry B. F. McFarland (Rep.), John W. Ross (Dem.), whose terms expire May 2, 1903, and Major John Biddle (non-partisan), who holds office during the pleasure of the President. The secretary is William Tindall.

Agriculture.—Agricultural interests in the District of Columbia are such as are usually found contiguous to a prosperous city. The acreage devoted to agricultural products has steadily declined, the acreage in 1860 being 34,463, and in 1900, 8,489. Much of the land used for agricultural purposes is at present being operated at a loss, and is only held for the increased value that it will bring in the future for residential purposes. Vegetable farms, dairy farms, florist establishments, and fruit farms constitute the greatest part of the agricultural investments. Cows seem to thrive especially in the atmosphere of the capital, the total number since 1890 having increased by 45 per cent., while the amount of milk which they have furnished to the residents of the city has increased by 84.9 per cent. Lands used for commercial floriculture are valued, together with improvements, at \$4,063,500, or 36 per cent. of the value of all agricultural land. An interesting feature of the distribution of the ownership of farm lands in the District is that of the 8,489 acres devoted to farming, negro farmers possess only 29 acres. This fact is somewhat astonishing, in view of the early emancipation of negroes in the District of Columbia and the unofficial aid extended to them from many quarters.

Manufactures.—Washington is not a manufacturing city in the general significance of the term, and nearly all the industries reported by the census in 1900 were what may be called neighborhood industries; that is, industries producing articles for local consumption. Including government establishments, there was invested in the 2,754 industrial concerns reporting, active capital to the amount of \$41,981,245, producing a product of \$47,667,622. To obtain this product, \$14,643,714 was expended for wages, \$19,369,571 for materials, and \$4,433,652 for miscellaneous expenses. Of the total value of the products, 20.6 per cent. was the product of governmental establishments and institutions. The number of persons employed in all mercantile establishments reporting was 8.9 per cent. of the total population of the District.

Finance.—The revenues of the District for the fiscal year ending June 30, 1901, were \$8,725,946.18, derived as follows: From taxes and other District sources, \$3,387,635.73; surplus revenues from previous years, \$387,577.18; unexpended appropriations, \$546,008.93, advanced from the United States treasury by an act of Congress, February 11, 1901, \$220,182.57, and the amount contributable by the United States to meet its proportion of the District's expenses under the organic law, \$4,184,541.77. The unexpended appropriations at the close of the year were \$546,008.93. The funded debt of the District on June 30, 1901, was \$15,070,180.18. No portion of this, however, was incurred under the present form of the District government. The total assessed value of taxable real estate and personal property in the District of Columbia on July 1, 1901, was \$198,488,413. The taxes imposed upon this property amounted to \$3,014,360.39. The general tax rate was \$1.50 for each \$100 of all property except that used solely for agricultural purposes, where the rate was \$1 per \$100 assessed valuation.

Education.—The report of the superintendent of schools for the year ending June 30, 1901, shows a total enrollment of 47,431 pupils, of whom 31,851 were white and 15,580 were colored. The whole number of teachers employed, including teachers of kindergartens, was 1,283, of whom 857 were white and 426 were colored. The increase of the enrollment of the year, 912, was somewhat less than 2 per cent. The number of half-day schools was 349, of which 92 were in grades above the second. For the past two years Congress has been making generous provision for new school houses, and if this liberal policy is continued it is expected that half-day schools will soon be unnecessary. The construction of two completely equipped manual training schools neared completion during the year. For more than a decade Washington has had one of the most complete systems of the manual training in elementary schools to be found in the country, and it is believed that the occupation of the new schools will mark an epoch in this development. Hitherto some difficulty has been experienced in inducing the girls in the manual training schools to study the distinctive features of the work there, but in the new school these features

will be made obligatory, and the previous defect, it is hoped, cured. The malady and the proposed remedy is thus described by the superintendent of schools: "In the mad race for the normal school our girls have ceased at the portals of the high school to be interested in stitches and gussets, in roasts and pastries, not from choice, but because the pathway of preferment has not lain through the fields of domestic science and art, but by way of the academic studies alone. This is all changed in the new courses of the manual training schools, and now advanced cookery, the work of the diet kitchen, millinery and dressmaking, become a part of the curriculum in the preparation for the normal school."

Congressional Legislation.—The celebration of the centennial of the establishment of the seat of government in the District of Columbia was held on Wednesday, December 12, 1900. The celebration was followed by a general popular demand that Congress should enact legislation for the improvement of the District. Congress responded to this demand, and in accordance with the recommendations of the District commissioners, made large appropriations for the year and authorized the advancing of money from the federal treasury to meet anticipated deficiency in the District revenues, so that no delay might be experienced in providing for the completion of a sewerage disposal system for Washington, the construction of a water-filtration plant, and the establishment of adequate water supply. Moreover, at the extraordinary session of the Senate held in March, a commission of eminent architects and landscape engineers was created to prepare a general plan for the improvement of the public park system of the District. (See article ARCHITECTURE.) This action was the result of efforts that had been made for several years by the commissioners and citizens of the District to have adopted a comprehensive scheme of park improvements. Another important act passed by Congress on March 3, 1901, established a code of laws for the District of Columbia, to take effect on January 1, 1901. This legislation was urged by the District bar in order to institute a systematic and authoritative arrangement of the laws and court procedure of the District. The new code, however, does not comprehend the mass of the laws relating to the administration of the government of the District, and the necessity of embracing these various municipal ordinances and regulations into a unified code is urged by the attorney for the District in his annual report.

DOMINICA. See LEEWARD ISLANDS.

DOMINICAN REPUBLIC. See SANTO DOMINGO.

DONNELLY, IGNATIUS, American author and politician, died at Minneapolis, January 1, 1901. He was born at Philadelphia, November 3, 1831, and was admitted to the bar in that city in 1852. Four years later he removed to Minnesota, and became actively concerned with State and national politics, being lieutenant-governor and governor, 1859-63, and member of Congress, 1863-69, as a Republican. After his return to private life he was editor of the *Anti-Monopolist*, a newspaper whose name explains its attitude toward combinations of capital and which advocated the policy of the "Greenbackers." He was repeatedly elected to the Minnesota Legislature, and was twice nominated for Vice-President of the United States, in 1896 by the People's Party and in 1900 by the "Middle-of-the-Road" Populists. While in Congress he was vigorous in the support of measures to create the National Bureau of Education and originated legislation providing for the planting of trees by the government. But it is in his writings that Mr. Donnelly's claim on remembrance lies. All of them display an eccentric ingenuity, but while attracting considerable attention have never been regarded seriously. His principal publication is *The Great Cryptogram* (1887), in which, by the application of Bacon's word-cipher to the First Folio of 1623, Mr. Donnelly attempts to prove the Baconian authorship of Shakespeare. Others are *Atlantis* (1882), an alleged proof that a large island of this name, well known to the ancients, once lay in the Atlantic in the same latitude as Gibraltar; *Ragnarök* (1883), an explanation of geological formations of the drift age by contact of comets with the earth; and *The American People's Money* (1895).

DRAMA. Of playwrights, the most conspicuous figure on the American stage in 1901 has been Mr. Clyde Fitch. During that year five original plays from his hand and one adaptation from the French have been acted for the first time—*The Climbers*, by Miss Bingham and her company; *Captain Jinks*, by Miss Barrymore and hers; *Lovers' Lane*, by a specially chosen cast; *The Way of the World*, by Miss de Wolfe and her company; *The Girl and the Judge*, by Miss Annie Russell and hers; and *The Marriage Game*, an adaptation of Angier's *La Mariage d'Olympe*, by Miss Martinot and hers. *The Marriage Game*, which vitiated Angier's veritistic comedy by the shifting of the scene to England and the anglicizing of personages and of a point of view essentially French, may be dismissed as journeyman's work that attracted little public notice. *Captain Jinks*, in its turn, was a very light, episodic, and somewhat fantastic comedietta, following with felicity and charm the

amatory adventures of an imaginary and youthful prima donna with the golden youth of New York in the "early seventies." It contained adroit reflections of the superficial life of that time, but in material and purpose it was largely fantastic. *Lovers' Lane*, while purporting to be a comedy of rural life in New England, revealed for the most part the conventional personages of American rural drama in the conventional, quasi-sentimental way.

In the three remaining plays Mr. Fitch has sought to deal truthfully, penetratingly, and more or less seriously with aspects of American life and with American personages as they exist to-day, especially in cities and large towns—a task that few American playwrights have set themselves and that none has achieved with such success. Mr. Fitch chose the personages of *The Climbers* from the newly rich and socially ambitious of New York to-day, and wove his play about the weakness of a well-intentioned man whom financial and social aspirations drive into various knaveries, and the contrasting strength of his wife and a friend who is half-a-lover. The merit of the play, though it does not lack constructive skill and emotional appeal, lay most in its keen, truthful, and felicitous picture of certain phases of contemporary life in New York. *The Way of the World*, a less serious and less dexterous play, was an attempt to mirror the manners of the socially elect in New York and the superficial aspects of a political campaign. *The Girl and the Judge*, as light a piece, draws its personages from the great American middle class, sets them in a Western town, and makes them revolve about the fortunes of a young girl with a dipsomaniac father and a kleptomaniac mother, and of the judge who is concerned in the divorce sought by the one and in the thefts of the other. Here, again, there is significant and felicitous, but less closely observed, characterization. It was easy to indicate Mr. Fitch's more obvious shortcomings—his unevenness of construction, his tendency to catch at the readiest theatrical expedient, his liking for stage effect that will a little startle his audience, the occasional dullness of his wit—but in a single year he has established his position as an American playwright who observes shrewdly and mirrors truthfully and significantly certain aspects and personages of our urban life. His work, moreover, has found much and continuing public favor.

Mr. Augustus Thomas, who in *Arizona*, *Alabama*, and other plays has proved himself as close an observer and as skilful a dramatist of the simpler, ruder, and out-of-door American life of our time in the Far West and in the South, fell away in *Colorado*, acted by a specially chosen cast, into conventional and indifferently made melodrama in which he sacrificed his wonted truth and humor of characterization to the making of stage "points" in crudely theatrical fashion. On the other hand, in *On the Quiet*, a farce acted by Mr. Collier, he produced an amusing piece of genuine American flavor, alike in personages and incidents, speech and humor, independent of both French and English models and deserving of the success it achieved. French farce indeed, that turns upon amatory embarrassments and marital infidelities, has for the time lost the favor of American audiences.

Several "rural dramas"—*Eben Holden*, drawn from the novel of that name and acted by Mr. Holland; *Sky Farm*, *New England Folks*, *Under Southern Skies*—have purported to deal with American life on farm or plantation. In the main, however, they have set the conventional personages of such pieces in the conventional frame, portraying the accepted incidents and coloring them with the accepted humors and emotions. In their minor personages there have been occasional instances of genuine characterization. One other attempt, beside Mr. Fitch's, to set our urban life on the stage—Mrs. Burton Harrison's *The Unwelcome Mrs. Hatch*, acted by Mrs. Fiske—was in large measure ineffective, partly through the 'prentice hand of the playwright, which shaped a thin plot inaptly and barely sketched her personages, and partly through a purely conventional treatment of the pursuit of her child by a divorced and distressed mother. Still another venture with a very different aspect of urban life—Mr. Klein's *The Auctioneer*—proved eminently successful. Its chief personage, a Jew of the East Side of New York, undergoes as a petty and tricky auctioneer, as a man of means living "uptown," and as a street peddler, all the vicissitudes of prosperity and adversity, in an appropriate environment of local scenes and personages. Much more than the playwright, Mr. Warfield, who plays the part, characterizes the Jew with persuasive insight, truth, comic and pathetic felicity, and the utmost fidelity of detail. Unfortunately, in the desire of playwright and manager to make Mr. Warfield a "star," the other East Side types, which promised much, were left only sketches. A single venture into American historical drama, Mr. Shippen's *D'Arcy of the Guards*, acted by Henry Miller, a pleasant comedy of the Revolution, passing in Philadelphia during the British occupation, deserved more vogue than it won.

On the whole the romantic drama, especially the romantic drama drawn from current and popular printed romances, found less favor in 1901 than in the previous year. Dramatizations of Miss Johnson's *To Have and to Hold*, acted by a special

cast; of Mr. Hewlett's *The Forest Lovers*, acted by Miss Galland; and of Miss Runkle's *The Helmet of Navarre*, acted by Mr. Dalton, all failed. The original romances have been widely enough read to quicken public curiosity to see their personages and incidents on the stage; but the transfer thither was clumsily done; the material bore ill the transfer; and the result was usually crude and disjointed melodrama with little real romantic flavor or atmosphere, and, in the case of *The Forest Lovers*, less poetic savor. On the other hand, "stage versions" of Mr. Major's *When Knighthood Was in Flower*, and of Ouida's *Under Two Flags*, which were no whit more deserving, enjoyed much popularity, due in large part to the established reputation of Miss Marlowe, who appeared in the one, and to the warm and robust acting of Miss Bates—one of the rare young American actresses with real passion in her—who impersonated the heroine of the other. In similar fashion, the real romantic ardor and glamor of Mr. Bellew's acting, to say nothing of its technical felicity and symmetry, carried a yet more clumsy dramatization of Mr. Weyman's *A Gentleman of France* to favor. An adaptation, with material changes in character and incident, of Mr. Tarkington's *Monsieur Beaucaire* served a like purpose for Mr. Mansfield. The play itself, a prettily disguised melodrama in which porcelain puppets stepped down from the shelf and spoke their mincing speeches and had their little adventures in the dress and surroundings of the eighteenth century in England, was more delicate and deft than most of its kind. It afforded also an admirable vehicle for the art of Mr. Mansfield in its lighter aspects. Rarely, of late years, has he acted with such grace and glamor and pictorial effect, with such lightness and elegance of tancy, touch, and speech, with such charming and versatile artifice. Mr. Stoddard, the veteran, lent like personal distinction, though in the very different vein of harsh and poignant revelation of the deep and primitive emotions of a misunderstanding and long unrelenting Scotch father to a passable dramatization of Ian Maclaren's *Bonnie Briar Bush*. Finally, two new versions of the old romantic play of *Don César de Bazan*—one made by Gerald du Maurier, acted by Mr. Faversham, and called *A Royal Rival*; the other made by Victor Mapes, acted by Mr. Hackett, and called *Don César's Return*—proved but futile rattlings of dry bones, upon which neither revisers nor actors put real dramatic flesh and blood.

The two original romantic plays of the year, Mr. Lawrence Irving's *Lovelace* and Mr. Huntley McCarthy's *If I Were King*, both acted by Mr. Sothern, excelled all the adaptations and stage versions of passing novels. *Lovelace* follows the fortunes, real and fancied, in love-making and in verse-making, on the field of battle and in destitute lodgings, of the poet and cavalier of the court of Charles I., culminating, after two acts of preparation, in a third of high, if sombre, imagination and moving climactic power. *If I Were King* likewise has a poet for its hero, François Villon, and the Paris of Louis XI., just emerging from the Middle Ages into the Renaissance for its picturesque environment. The playwright makes the poet for a week master of France, with his head as a price of the royal caprice, were it not that the noble lady for whose heart Villon has sued finds another and gentler penalty. The play was notably well made and interesting, abounding in the glamor, the warmth, brightness, and general picturesqueness of genuine romantic drama. The personages were of real flesh and blood, heated by becoming romantic ardor; their speech was felicitous, their actions adroitly contrived. The whole piece, in fine, had enough imagination, romantic, and, on occasion, poetic quality and atmosphere to give it, with its theatrical fitness for its purposes, distinction. To both the parts of *Lovelace* and Villon, Mr. Sothern brought the finer qualities of his maturing art—qualities that meet half way imaginative romantic drama.

On its pictorial side, in its distortion of historical and quasi-historical personages for theatrical ends and in the primitive frankness of its emotional content, Mr. Belasco's *Du Barry* may fall into the category of romantic drama. In fact, however, it is *sui generis*—big and inchoate yet teeming with detail, mechanical yet reflecting with imagination the superficial aspect of two epochs, crude in characterization and incident yet deftly contrived. Pictorially it shows vividly and with full command of every material theatrical resource the outward semblance of the Paris and the Versailles of Louis XV. and of the Terror. In this environment it follows the life of the famous mistress of that prince from the milliner's shop through the palace to the guillotine, now clinging close to ascertained fact, now clothing her with new and strange virtues. Moreover, the passions of this *du Barry* are precisely those that suit the primitive temperamental force of Mrs. Leslie Carter, who plays the part. Throughout pictorial subtleties jostle mere bigness, crudeness, and stage mechanics.

From European dramatists, and especially from English hands, our theatres in 1901 drew much fewer plays than usual. The London theatres, upon which our managers must depend, have been busy with revivals of Shakespeare, with poetic dramas, or with contemporary comedies of sentimental and sexual infelicities ill-

suited, in the managerial view, to our stage. There have been many failures and revivals in London. Paris, with its *pièces à thèse* and mimic pictures of a life strange and incomprehensible to American audiences and its ludicrous farces, has also been unusually barren. None the less, Captain Marshall, one of the most promising of the younger English playwrights, provided, Mr. Drew with an adroit, human, truthful, and charming sentimental comedy, with a sting of pathos underneath, of English military life on the eve of the Boer War, *The Second in Command*, and a part admirably suited to the actor's powers. Mr. Esmond likewise gave Miss Anglin and Mr. Richman an imaginative and graceful comedy, *The Wilderness*, charged in its final episode with deeper human feeling, in which he lets his fondness for sentiment run into frequent sentimentality. For Miss Adams, Mr. Barrie, the novelist, also contrived a pretty comedy of sentiment and fantasy, *Quality Street*. For two acts it reflects the life of the quietest and most respectable of spinster folks in a little English provincial town during the Napoleonic war, with the simplicity, insight, gentleness, humor, and dexterity of Miss Austen herself, and with skillful understanding of delicate stage effect. Then it runs away, with the amatory adventures of the heroine, into sheer, bubbling fantasy. Then it ends thinly and feebly, but with room always for the play of Miss Adams' familiar traits. From England, too, came a dramatization of A. E. W. Mason's novel, *Miranda of the Balcony*—a play of serious emotions and picturesque Spanish and African environment—in which Mrs. Fiske acted impressively.

Of revivals only two require note—the one of Sardou's *Diplomacy*, by the company of the Empire Theatre, New York, which lacked the polish of high comedy; the other of *Uncle Tom's Cabin* for the first time in a spectacular setting.

Of visiting players, Sir Henry Irving and Miss Terry have again made an American tour, reviving Mr. Willis' tragedy, *Charles I.*, appearing in Sardou's *Mme. Sans-Gêne* for the first time on this side of the sea, and repeating more familiar plays and parts. Both have been well received, but both as unmistakably have passed their acting prime. From England also has come for the first time Mr. Hawtrey, a comedian of personal distinction, naturalistic method, quiet sense of humor, much polish and finesse, and adroit command of the more delicate resources of his art. A single fantastic play of contemporary London life, *A Message from Mars*, has sufficed him. Finally, on the last day but one of the year, Mrs. Patrick Campbell, the foremost of the younger and more serious-minded English actresses, made at Chicago her first appearance in America, acting the heroine in Sudermann's *Magda*. Other plays followed, so that she belongs properly to the record of 1902.

During the early part of the year Mme. Sarah Bernhardt (*q.v.*) in company with the elder Coquelin (*q.v.*), made an extended tour of the United States, beginning and ending in New York. Mme. Bernhardt appeared in two of her old parts, *Fédora* and *La Tosca*, and in two new rôles, the Duke of Reichstadt, in Edmond Rostand's *L'Aiglon*, and in *Hamlet*. As the consumptive hero of Rostand's melodrama, Mme. Bernhardt made use of her long acquaintance with *Camille*. Her *Hamlet* as a *tour de force* was an excellent piece of work. M. Coquelin's Flambeau in *L'Aiglon* and First Gravedigger in *Hamlet*, were beautiful examples of character portrayal executed in the finest spirit of classic French art.

In London in 1901 Sir Henry Irving unsuccessfully revived Shakespeare's *Coriolanus*; Mr. Forbes Robertson was not acting; Mr. Tree revived Shakespeare's *Twelfth Night*, with an opulent and illusive setting, and followed it with Mr. Fitch's pictorial play, with D'Orsay as its principal figure, *The Last of the Dandies*. Mr. Alexander and Mr. Wyndham busied themselves with comedies of contemporary life by Mr. Chambers and Mr. Isaac Henderson; a specially chosen cast acted Mr. Pinero's newest play, *Iris*, in which he reverts once more to distorted and unhappy sexual relations and to subtle analysis of a contradictory and perverted heroine; Mr. Esmond has, had similarly acted yet another ultra-sentimental play; Mrs. Campbell has appeared in Björnson's moving Scandinavian drama of faith and miracle, *Beyond Human Power*, and Mr. Gillette, the American actor, has achieved much public favor as Sherlock Holmes. In Paris, the internal discipline of the Théâtre Français has been changed for the first time since the Moscow decree of the first Napoleon, to the increase of the directors' and the lessening of the actors' control of the house and its plays; MM. Capus and Levédan have confirmed their positions as graceful, amusing, subtle, ironic, and adroit makers of plays of contemporary Parisian life of the aristocratic and boulevard sort; MM. du Curel, Brieux, Hermant, and other practitioners of the *pièce à thèse* have worked in their usual vein, and so boldly that the censorship suppressed the newest of M. Brieux's plays, and M. Hervieu has had acted at the Théâtre Français a sombre and powerful drama of marital infelicity, *L'Enigme*. In Germany the dramatists of established reputation have produced characteristic, but not especially noteworthy, pieces, while no new playwrights have risen to rival them. In Italy d'Annunzio has written and Duse has acted a tragedy that tells with overflowing poetic beauty and high and

FRENCH ACTORS.—Madame Sarah Bernhardt (Upper). Coquelin the Elder (Lower)

moving dramatic power the tale of Francesca da Rimini and incidentally pictures mediæval Italy.

DRUG HABIT. See COCAINE HABIT, MORPHINE HABIT, PETROLEUM DRINKING.

DRYGALSKI, ERIC DAGOBERT VON, the Prussian explorer, who led an expedition to the Antarctic region in 1901, was born at Königsberg, Prussia, February 9, 1865, and was educated at Königsberg, Bonn, Leipsic, and Berlin. From 1888 to 1891 he was an assistant in the Geodetic Institute and the Central Bureau of the International Geographical Society at Berlin, and headed two expeditions to the west coast of Greenland, in 1891 and in 1892-93, which were sent out by the society. The expedition led by Dr. Drygalski in 1901 was backed by the German government, and its objective point is Kerguelen Island, where a magnetic station is projected from which other expeditions will start. He is expected to return in 1904. An account of the West Greenland expedition was published in the Geographical Society's annals (1891-95), and he has published the results of other exploring expeditions. See ANTARCTIC EXPLORATION.

DUFFIELD, JOHN THOMAS, American educator, died at Princeton, N. J., April 10, 1901. He was born at McConnellsburg, Pa., February 10, 1823, graduated at the College of New Jersey in 1841, and entered the Princeton Theological Seminary in 1844. Shortly afterward he was elected a tutor in Greek in the college, became assistant professor of mathematics in 1847, and seven years later was given the emeritus chair of mathematics. He was licensed to preach in 1849, and for several years occupied the pulpit of the Second Presbyterian church at Princeton. He received the degree of D.D. from Princeton in 1872, and that of LL.D. from Lake Forest University in 1890. Professor Duffield wrote much on current religious topics, and for a long time managed the distribution of funds to needy students of Princeton University.

DUNANT, Dr. JEAN HENRI, the Swiss physician and philanthropist who received one-half of the Nobel prize (*q.v.*) for the encouragement of peace and arbitration, was born at Geneva, Switzerland, May 8, 1828, and was educated as a physician in his native country. His great work was in the agitation for the better care of the sick and wounded in time of war, and his book, *Un Souvenir de Solferino* (1862), did much toward the establishment of medical camps in the continental armies, and led to general consideration of the subject. His other books include *Fraternité et Charité internationales en temps de guerre* (1864), *L'empire romain reconstitué* (1859), *La régence de Tunis* (1858), and *La renovation de l'Orient* (1865).

DUNGLISON, RICHARD JAMES, American physician and author, died in Philadelphia, March 4, 1901. He was born in Baltimore, November 13, 1834, and after graduating at the University of Pennsylvania in 1852, took his degree in medicine at the Jefferson Medical College of Philadelphia four years later. During the Civil War he was in the government's service as an acting assistant surgeon, on duty at Philadelphia, and later achieved a wide reputation in the medical profession as a practitioner, an author, a member of many medical societies in America and Europe, and as an officer of medical congresses. Dr. Dunglison was the author of *Practitioner's Reference Book* (1877), and *Elementary Physiology* (1879), and revised and enlarged the *History of Medicine* (1872), and *Medical Lexicon* (1874), by his father, Robley Dunglison, M.D. He was also one of the founders and for a long time the editor of the Philadelphia *Medical Times*.

DUNKARDS, TUNKERS, OR GERMAN BAPTISTS, a sect resembling Quakers in simplicity of dress and speech, originated in Germany, and came to the United States in the early part of the eighteenth century. The Brethren Church (Conservative) in this country now numbers about 100,000 communicants, with 2,625 ministers and church property to the value of nearly two and one-half million dollars. It has an extensive printing establishment at Elgin, Ill., which controls a periodical circulation of 100,000, and it maintains seven colleges, with a student enrollment of nearly 2,000. The General Mission Board, endowed with \$500,000, supports missions in Denmark, Sweden, France, Switzerland, and India, and is opening up stations in Canada and extending its home missionary work. The year 1901 was one of progress in the addition of some 5,000 new members, in the increase of mission receipts, and in general improvement along missionary lines. In 1902 the general conference will be held at Harrisburg, Pa., beginning on May 20. Besides the Conservative branch of the Brethren, by far the most numerous, there are three other bodies with comparatively small constituencies; including these the Dunkards number over 115,000, and have 3,000 ministers and 1,100 churches.

DUTCH EAST INDIES, the island possessions of the Netherlands in Asia, comprising the islands of Java, Sumatra, Celebes, parts of Borneo, and New Guinea, Banca, and Moluccas, the Timor archipelago, and a few smaller groups. Their total area is estimated at 736,400 square miles, and the popu-

lation something over 34,000,000, excluding the unexplored regions. Of the inhabitants 32,000,000 are natives, 460,000 Chinese, and 63,000 Europeans. The prevailing religion is Mohammedanism, but there are over 300,000 Christians of various sects. The dependency is divided into two parts, one comprising Java and Madura, where Dutch control is complete and the government well organized, and the other known as the "outposts," including all the rest of the islands, in some of which Dutch sovereignty is merely nominal. At the head of the colonial administration is a governor-general, who is vested with both executive and legislative powers, the latter being exercised subject to the approval of the home government. He is assisted by a council of five members, whose powers are both legislative and advisory. There are two sets of laws in force, one based on the laws of the Netherlands, for the European population, and the other formulated with special reference to the native customs and institutions. This division of the whole population into two classes is recognized as a fundamental principle in the policy of administration and is incorporated into the colonial code. The entire colony is divided into residencies, regencies, and districts, some of which are administered by Dutch officials and some by native chiefs. There is a colonial army of 44,000, mostly natives, and a navy, only partially colonial, of 24 vessels. The revenue and expenditure of the islands in 1900 were 141,989,008 guilders and 147,766,255 guilders respectively, and the estimates for 1901 showed an expenditure of 149,885,383 guilders and a revenue of 149,935,934 guilders. The guilder is worth 40.2 cents. The revenue is derived largely from taxes and the government monopoly on opium and salt. Agriculture is the chief industry and the principal products, with total production for 1898 (last official records) are: Sugar, 1,538,701,400 pounds; coffee, 60,569,600 pounds (156,503,866 pounds in 1897); and tobacco, 85,430,129 pounds. Cinchona, tea, and rice are also produced. There are valuable tin mines in Banca, and coal is mined in Java, Sumatra, and Borneo. The total value of the imports in 1898 was 179,821,432 guilders and of the exports 217,754,097 guilders, four-fifths of the latter going to the Netherlands. At the beginning of 1900 the railways in Java and Sumatra had a total length of 1,338 miles, representing a capital of \$71,556,000; about 1,100 miles belonged to the state. There are 173 public schools of all grades for Europeans, and 20 private schools, with 15,000 pupils enrolled, and 1,200 native schools, public and private, with 134,946 pupils enrolled (1898). See BORNEO, CELEBES, JAVA, NEW GUINEA, and SUMATRA.

DUTCH GUIANA, or SURINAM, a colony of the Netherlands in South America, bounded by the Atlantic Ocean, French Guiana, Brazil, and British Guiana, has an estimated area of 46,000 square miles and an estimated population of 68,972, exclusive of negroes living in the forests. The capital is Paramaribo, with about 31,200 inhabitants. The colony is administered by a governor, assisted by an executive council composed of the governor as president, the attorney-general as vice-president, and three other members, all of whom are nominated by the crown. There is a colonial legislature, most of whose members are elected by limited popular vote. Magistrates of the central court are named by the crown. There are elementary public schools, and normal schools under ecclesiastical control. Educational provisions for the dependent populations are in the hands of the various religious bodies, to which the government appropriates funds. A militia consisting (1898) of 433 men, a civil guard of 1,654 men, and a garrison of 346 men, comprise the armed land force of the colony. Vessels of the Netherlands navy are always stationed along this coast, and there are some guard-ships. The revenue for 1900 was 2,296,000 guilders (guilder equals 40.2 cents), besides a government subvention of 128,000 guilders to balance the expenditure. The revenue is derived from customs, excise dues, and taxes. The chief products are sugar, cacao, bananas, coffee, rice, maize, rum, and molasses. Gold is quite extensively mined, the gold export for 1898 reaching a value of 1,136,606 guilders. The imports for 1900, stated in pounds sterling, were £513,882, exports £461,739. The development of the colony is difficult and slow, owing to the indolent habits of the native laborers.

Chartered sailing vessels from the United States touch monthly at Paramaribo; a steamer of the Royal English mail once in two weeks; and steamers of the Royal Dutch mail line bi-monthly. Inland communication is largely by means of the rivers. There are no railways.

DUTCH REFORMED CHURCH. See REFORMED CHURCH IN AMERICA.

EARTHQUAKES. R. D. Oldham, in the report on the great Indian earthquake of the 12th of June, 1897 (*Memoirs Geological Survey, India*, xxix., 1899), states that it has not been surpassed by any in history. An area of 150,000 square miles was ruined, walls were rent, and water poured out from the fissures. In addition, an area of 1,750,000 square miles felt the shock, and the wave traveled 120 miles per minute. Two hill stations were apparently elevated 20 inches in altitude. A number of faults were noticed on the surface, and one of these had a

displacement of 25 feet and a length of 12 miles. C. Davidson, in an article on the *Progress of Seismology During the Nineteenth Century* (*Knowledge*, xxiv., 1901, pp. 44, 45), describes the advances which have been made since the time of Darwin's *Memoir on the Volcanoes of South America* and the beginning of Perry's *Earthquake Catalogues*. The Japanese earthquake investigating committee has issued numbers 5 and 6 of its publications. They state that in the park at Hongo, Tokio, there has been erected an earthquake-proof house in which two large pendulums are placed for registering earth tremors. Among other articles may be mentioned one by G. Gerland, *Die Moderne Seismische Forschung* (Verh. des vii., Int. Geogr.-Kongr., ii., p. 148, Berlin, 1901).

Few earthquakes of a serious character occurred during the year 1901, and most of these were somewhat limited in their extent. An earthquake was reported from Grazelma, province of Cadiz, Spain, on February 10, 1901, which produced considerable damage to buildings, and caused the disappearance of a body of water which furnished power to the local industries. On March 31, eastern Europe was visited by an earthquake, while shocks were also felt in Italy, and observations were made at the various seismological observatories. On April 24, Rome suffered from an earthquake which inflicted damage on the Pantheon and on parts of the Vatican. Shocks were also experienced on May 11 in Sicily, and at Florence on May 21. Basle, Switzerland, was visited by an earthquake on May 22, which moved from north to south and was plainly felt. Caracas, Venezuela, where so much damage had been done by an earthquake, on October 29, 1900, experienced another shock on June 11, 1901. One or two minor earthquakes occurred in England and Scotland during the summer, but the destruction of a few chimneys was the extent of the damage done. Severe shocks occurred in Erzerum, Armenia, in November.

EAST AFRICA, a general term applied to British, German, and Portuguese East Africa. The total estimated area is about 1,800,000 square miles, and an estimated population of about 15,800,000. See the four articles following and **UGANDA** and **ZANZIBAR**.

EAST AFRICA, BRITISH, a territory extending from the Egyptian Soudan to German East Africa and embracing some 1,120,000 square miles, comprises the East Africa Protectorate and the Uganda Protectorate (*q.v.*), together with the island protectorate of Zanzibar (*q.v.*). Great Britain has no colonies proper in this part of Africa.

EAST AFRICA, GERMAN, a protectorate of Germany extending from the British to the Portuguese East African possessions and from the Indian Ocean to Lake Tanganyika, has an estimated area of 384,000 square miles. According to the official estimate of January 1, 1900, the inhabitants numbered 6,105,000, of whom only 1,139 were Europeans. The largest cities are Dar-es-Salaam (the seat of government), Bagamoyo, Kilwa, Saadani, and Pangani, all on the coast. The protectorate, which is administered by an imperial governor, is not self-supporting, and large imperial contributions are made. The estimated revenue (including imperial subsidy of 6,700,000 marks) and expenditure for the fiscal year 1901 balanced at 9,708,000 marks. For the fiscal year 1902 the revenue was estimated at 46,000 marks less and the imperial subsidy at 1,156,000 marks more. (The mark is worth 23.8 cents.)

Various tropical products are raised. The leading exports are rubber, ivory, and horns, grain, and gum-copal. The German government, though hampered by the *Reichstag*, is making considerable effort to develop the country, but during the last few years trade has steadily declined.

Imports in the fiscal year 1898-99 amounted to 11,852,656 marks, and in 1899-1900, 10,822,586 marks; exports for the two years were valued at 4,332,945 marks and 3,937,150 marks respectively. The stagnation of trade is due in part to lack of transport facilities; for, though a number of good roads have been built from the coast far into the interior, general communication is difficult and the railway mileage is small. The railway from Tonga to Karagwe (54 miles), a large part of which had been in operation for over a year, was completed in the summer of 1901. The survey is being carried on to Mombo, about 28 miles beyond Karagwe. In the fall of 1901 only about 30 miles of the proposed railway from Dar-es-Salaam to Mrogoro had been surveyed. In April, 1901, Count von Bülow, the German imperial chancellor, brought before the *Reichstag* a bill providing for the construction of this line. The proposed line would be built by a German syndicate, on whose capital of £1,200,000 the government would guarantee interest at 3 per cent. Although the chancellor regarded the railway as an absolute necessity, the bill met opposition, and figures were cited purporting to show that the line could not pay. In May, however, the plan for its construction, with some modifications, was recommended by the budget committee; but the final passage of the bill, which did not take place in 1901, was by no means assured. Advocates of a progressive colonial

policy maintain that much valuable time has been lost through "the pettiness of shortsighted colonial politicians."

On February 23, 1901, Baron von Richthofen, the German foreign secretary, and Sir Frank Lascelles, the British ambassador at Berlin, on behalf of their respective governments, signed an agreement fixing the delimitation of the German and British possessions between the northern end of Lake Nyassa and the southern end of Lake Tanganyika. The agreement was based on the proposals of the mixed commission appointed to delimit the boundary in pursuance of the Anglo-German agreement of July 1, 1890. The boundary begins at the mouth of the Kalambo River at Lake Tanganyika, and follows that stream to its confluence with the Samfue stream. The latter constitutes the boundary to its southeastern source, whence the line follows a series of boundary pillars and rivers to the junction of the Katendo stream with the Songwe River, and then follows the latter to its mouth at Lake Nyassa.

EAST AFRICA, PORTUGUESE, a colony of Portugal, extends along the eastern coast of Africa from Cape Delgado to Kosi Bay, touching German East Africa on the north and Tongaland (British) on the south. The estimated area of its two principal districts, Mozambique and Lourenço Marques, and several smaller districts, is 301,000 square miles and the estimated population 3,120,000. The colony is administered by a royal commissioner. There is a military force of about 4,900 men, of whom some 3,250 are natives. The principal imports are cotton goods, iron wares, and alcoholic liquors, and the leading exports include rubber, ores, wax, and ivory. For 1899 the imports and exports were valued at about \$7,785,000 and \$790,000 respectively, while in addition the transit trade amounted to about \$10,925,000. A railway is in operation from Lourenço Marques, on Delagoa Bay, to the Transvaal frontier, 57 miles, and thence extends 290 miles to Pretoria. Another line runs from Beira, near the mouth of the Pungwe River, for 222 miles to Umtali, near the Maslionaland frontier, and thence is continued about 180 miles to Salisbury. In 1901 a railway about 20 miles in length was projected to connect Sao Domingo with the port Quilimane. There are about 950 miles of telegraph line in the colony; Lourenço Marques has telegraphic communication with the Transvaal, and Beira with Cape Town, by way of Salisbury and Buluwayo.

The United States consul at Lourenço Marques, writing in September, 1901, stated that little business could be transacted in the colony before the end of the South African war. The entire transportation system of South Africa, he said, was taxed to its utmost capacity in supplying the troops with rations, munitions, etc., and the ordinary merchandise was allowed to lie for months at the ports. Railway traffic, moreover, was not entirely safe, as trains on the Delagoa Bay railway were occasionally captured and destroyed by the Boers.

EAST AFRICA PROTECTORATE, a British dependency, bordering the Indian Ocean between the Juba and Umba rivers and extending inland to Uganda, has an estimated area of 1,000,000 square miles and an estimated population of 2,500,000. It is not unlikely that the figure given here for area is too large. The protectorate is administered by a British commissioner, Sir C. N. E. Eliot since 1900, who is also British agent in Zanzibar. There are four provinces under sub-commissioners: The Coast Province, Tanaland (including the former small coast protectorate Witu), Ukamba, and Jubaland. The capital is Mombasa (population about 30,000), which is one of the chief cities, and has, perhaps, the finest harbor on the East African coast. This city has telegraphic communication with the coast city Lamu, and also with Europe through cable communication with Zanzibar.

Revenue and expenditure for the fiscal year 1900 amounted to £69,770 and £183,868 respectively. Imports and exports in the fiscal year 1900 were reported at £442,800 and £121,667 respectively; for 1901, £444,142 and £83,959 respectively. The leading imports are cotton goods, rice, grain, flour, and building material, and the chief exports are ivory, rubber, live stock, hides and horns, and gum-copal.

The Uganda Railway, connecting Mombasa with Port Florence on Victoria Nyanza, was begun on December 11, 1895, and completed in December, 1901. The first locomotive reached Port Florence on December 20. According to the original survey of this line, the total length was to be 670 miles; a shorter route, however, was followed, so that the actual length of road constructed at the end of 1901 was 572 miles. The engineering difficulties of this railway, which reaches the lake at an altitude of more than 3,000 feet above sea level, after crossing intervening mountain ranges of twice that altitude and more, were very great and have been little understood. The road was carried through dense forests, through deep cuttings of rock and soil, and over many streams which on account of the sudden and varying rainfall were difficult to bridge. At Mombasa is a bridge connecting with the mainland 1,732 feet in length. The total cost of the line, which has a one-metre gauge, has been estimated at £5,206,000. It is expected that an extension from the present terminus at the lake will be made to Port Victoria, 50 miles distant. It is believed that the railway will serve to develop greatly both the East African Pro-

tectorate and Uganda. The Germans fear, seemingly with good reason, that it will divert traffic from their protectorate, and accordingly have become more urgent in their pleas to the *Reichstag* for railway appropriations.

On November 16, 1900, Mr. Arthur Jenner, sub-commissioner of Jubaland, was murdered by a band of insurgent Ogaden Somalis. A punitive expedition, numbering about 500, under Colonel Trevor TERNAN, was organized at Kismayu, and on February 5, 1901, occupied Afmadu, the headquarters of the insurgents, about 80 miles from Kismayu, and the Ogaden sultan was taken prisoner. It was learned that the sultan's brother and other chiefs who had fled northward were the real culprits. While in pursuit of these the expedition was attacked, on February 16, at Somasa, 57 miles from Afmadu, and lost 17 killed; the enemy, however, were repulsed with a loss of 150. There were several subsequent skirmishes, and about the middle of March the expedition, having suffered severely from great heat and scanty supplies of water, returned to Kismayu for refitting. The expedition returned to the interior and reached a successful conclusion in May, when the chief sultan acquiesced in the payment of a fine for the murder of Mr. Jenner.

It was reported in May, 1901, that severe fighting had also occurred in Tanaland—a province adjoining Jubaland—where some Ogaden Somals, who had emigrated from Jubaland, had plundered and committed various other outrages upon friendly natives and Arabs. A party under the sub-commissioner, Captain A. S. Rogers, defeated the Somalis, taking many prisoners and capturing 5,000 cattle, sheep, and goats.

ECLIPSE CYCLE, STOCKWELL'S, and ECLIPSE, SOLAR. See **ASTRONOMICAL PROGRESS.**

ECONOMIC ASSOCIATION, AMERICAN, organized in 1885; president, Professor E. R. A. Seligman, Columbia University; secretary, Professor Frank Fetter, Cornell University. The largest session of the American Economic Association since its foundation was held in Washington, December 27 to 30, 1901; 150 delegates were in attendance. The annual address was delivered by the president for 1901, Professor Richard T. Ely, of the University of Wisconsin, on *Industrial Liberty*, at a joint meeting of the American Economic and the American Historical associations. Of the various papers read before the Association, those possessing the greatest present interest were *The Meaning of Recent Expansion in the Foreign Trade of the United States*, by Brooks Adams, and *The Commercial Policy of Europe*, by Worthington C. Ford, formerly chief of the Bureau of Statistics, now of the Boston Public Library, upon the general subject of *International Trade*. Mr. Adams contended that the westward movement of civilization is steadily enlarging the diameter of the economic system, disturbing the stability of the social equilibrium, changing the direction of trade routes, and "throwing the ancient capitals into eccentricity. This signifies ruin for the city and annihilation for the population." He also contended that war was an instrument of commercial competition as much as trade, and that this weapon was wielded by the unsuccessful civilizations against those nations which supplanted them in the struggle for economic supremacy, and that therefore an outbreak of war at certain periods of economic development was to be expected. Such a crisis he now considers has arrived—"As with Nineveh so with London. As the volume of American exports has grown, so has the tide of exchanges set more decisively against Great Britain, until her people have literally eaten up the accumulations they once possessed in America." All signs, in Mr. Adams' opinion, point to an imminent world crisis, wherein Europe will unite against the encroachments of the United States. "Unless all experience is to be reversed, the ferocity of the struggle for survival must deepen until one of the two competing economic systems is destroyed. Were all other signs wanting, we can see the shadow of the approaching crisis in the failure of the purchasing power of Europe, which is reflected in our declining exports and in the threats of retaliation which we daily hear."

Mr. Ford's paper was along similar lines. On the basis of an extended discussion of the commercial treaties of Europe, he attempted to show that Russia was deliberately separating herself from her western neighbors, and that western Europe may take similar action against the United States. "There is no doubt that Russia is intent upon shutting out the whole world commercially, and upon destroying the German in its western provinces. One ukase follows the other, and scarcely is one additional duty enforced when another is proposed, for the most part duties which must offend Germany more than any other." The exclusion of the United States from European markets would not be accomplished by any formal alliance against us among European powers, but by "the conscious imitation of regulation by more than one power." The general dread of the increasing encroachments of United States exports might influence the powers of central and western Europe to adopt similar measures to exclude our trade. Mr. Ford considered that the only way in which this calamity could be avoided would be by the adoption of a policy

of reciprocity by the United States. "To conciliate opposition by wise concession is the part of true statesmanship; to offer a better use of our undeniably great resources is the true economic policy of the United States, and this betterment cannot be obtained by wilfully closing the best markets to our products. The tariff should not be an implement of offense, of commercial war, but one of revenue and commercial peace."

Other papers read before the Association were as follows: On "Economic Theory:" *Some Theoretical Possibilities of a Protective Tariff*, by Assistant Professor Thomas N. Carver, of Harvard University; *The Position of the Workmen in the Light of Economic Progress*, by Professor Charles A. Tuttle, of Wabash College. On the "Labor Problem": *The Negro in the Yazoo-Mississippi Delta*, by Alfred H. Stone, Greenville, Miss.; *Conciliation and Arbitration Among Miners*, by Herman Justi, commissioner of the Illinois Coal Operators' Association; *Study of Spanish and American Administrative Methods*, by T. S. Adams, of the University of Wisconsin, late assistant to the treasurer of Porto Rico; and *Report of the committee on uniform municipal accounts and statistics*; and at the second joint meeting with the American Historical Association, *Historical Materialism and the Economic Interpretation of History*, by Professor Seligman. The work of the committee on uniform municipal accounts and statistics of the National Municipal League deserves special attention. The object of the work of this committee is to submit a scheme of municipal accounting which will not only be of service to the taxpayers of those cities which adopt it, by enabling them to understand the methods and results of collection and disbursements, but also enable a comparison of the finances of different cities—a thing impossible in the present confusion of municipal accounts. The committee is largely composed of expert accountants, among them Mr. C. W. Haskins, of Haskins & Sells, New York, and Dr. E. M. Hartwell, of the Boston Statistical Commission. As the plans of the committee develop they are, as far as possible, put into operation in various cities. The system of accounts of Chicago, for example, has been recently reconstructed in this manner by Mr. Harvey S. Chase, of Boston, under the direction of Haskins & Sells. The committee reported that considerable progress had been made, and that in another year they hoped to be able to present a complete scheme to the league, which would then recommend its general adoption by municipalities.

ECUADOR, a South American republic on the Pacific coast, lies between Colombia and Peru. The capital is Quito.

Area, Population, etc.—The area of the 16 provinces and one territory comprising Ecuador has been estimated at 120,000 square miles. There are unsettled boundary disputes with Colombia and Peru. The estimated population is 1,270,000, of whom some 870,000 are Indians. On June 12, 1901, the president approved a law providing for the establishment of a board of immigration, "whose object shall be to attract and encourage foreign immigration, and to found colonies in different parts of Ecuador."

The only church having a legal status is the Roman Catholic. Primary instruction is free and nominally compulsory. In 1898 349,318 sucres were expended for public instruction and 438,848 in 1899.

Government.—The chief executive is a president, assisted by a cabinet, while the legislative power devolves upon a congress of two houses, the senate and the house of representatives. The president for the four-year term ending in August, 1901, was General Eloy Alfaro, a Liberal; he was succeeded by General Leonidaz Plaza, also a Liberal, who was inaugurated at Quito on August 31. The salient features of General Alfaro's administration were the undertaking of the railway to Quito and the curtailment of clerical power in secular affairs.

Finance.—The law establishing the gold monetary standard, enacted in November, 1898, went into effect on November 4, 1900. The unit of value is the sucre, valued at 48.665 cents, or one-tenth of a British sovereign. Revenue is derived chiefly from customs duties, and the largest items of expenditure are service of the debt and appropriations for public works. The revenue and expenditure in 1898 were 7,805,190 sucres and 7,735,710 sucres respectively; in 1899, 7,625,830 sucres and 6,662,945 sucres respectively. Of the revenue in 1899 6,184,632 sucres accrued from customs. The estimated revenue in 1900 was 8,268,100 sucres and the estimated expenditure 8,967,783 sucres. The external debt in 1900 stood at \$693,160 (\$3,373,263), of which bonds amounting to \$676,400 (\$3,291,701) were deposited for exchange into bonds of the Guayaquil and Quito Railway Company. The internal debt has been reported at 7,500,000 sucres.

Industries and Commerce.—Agriculture is the principal industry and the chief product is cacao. The total cacao production in metric tons (2,204.6 pounds) is reported at 21,000 in 1898 and 26,415 in 1899; there was a considerable decrease in 1900. The total imports and exports in 1898 were valued at 9,869,795 sucres and 15,095,145 sucres respectively. In 1899 the exports amounted to 21,410,248 sucres;

figures for the imports are not available, since the records were destroyed by the great Guayaquil fire of November 27, 1899. The imports amounted to 13,431,179 sucres in 1900 and the exports 15,419,222 sucres. In 1900 imports and exports each to the value of over 12,000,000 sucres passed through the port of Guayaquil.

The values of the leading exports in 1900 were: Cacao, 10,700,581 sucres; ivory nuts, 1,400,793 sucres; crude rubber, 1,076,068 sucres; silver bullion and coin, 349,876 sucres; and straw hats, 321,367 sucres. In 1899 the cacao export amounted to 27,703 metric tons, of which 24,072 passed through Guayaquil; in 1900 the export from Guayaquil was 15,846 tons. Of the latter amount 7,302 tons were sent to France, 2,365 to Great Britain, and 2,267 to the United States.

Communications.—The railway from Durán (opposite Guayaquil) to Chimbo, which has been stated to be 58 miles in length, but more recently 67, has been practically rebuilt to conform to the line now under construction from Chimbo to Quito, 219 miles distant. This line is being constructed for the Ecuadorian Association, of London, by the James P. McDonald Company, of New York. The chief engineer and general manager is Mr. John A. Harman. On July 1, 1901, about 5,000 laborers were employed on the work, including about 2,730 Jamaicans, 1,800 Ecuadorians, 305 Barbadians, and 240 Porto Ricans. At that time there were nearly completed from Durán 25 miles of road, and 120 miles were located. The ascent of the Andean plateau will be made in part by the switchback system. The section between Chimbo and Sibamba, 48 miles, presents the greatest engineering difficulties. It was hoped that the railway would be completed to Guamate, 30 miles beyond Sibamba, before the end of 1901. Guamate is a point of much importance, since there roads from the interior converge.

ECUMENICAL CONFERENCE, METHODIST. See METHODIST ECUMENICAL CONFERENCE.

EDDIS, EDEN UPTON, English artist, died in London, April 7, 1901. He was born in 1812, studied art first under Sars, and in 1827 entered the Royal Academy School. He was a medalist of the next year, and for fifty years thereafter exhibited regularly at the Academy. Among his best known canvases are "The Sisters," an illustrative work; "Ruth and Naomi," and "The Raising of Jairus' Daughter." Later in life he achieved a wider fame as a painter of children's portraits, his "Going to Work" being perhaps the most popular.

EDUCATIONAL ASSOCIATION, NATIONAL, held its fortieth annual meeting at Detroit, Mich., in July, 1901. The number of noteworthy papers and addresses was unusually large. Among these were *Isolation in the School*, Dr. W. T. Harris, United States commissioner of education; *Educational Progress of the Year*, Dr. Elmer E. Brown, University of California; *Lessons of the Educational Exhibits at Paris*, Anna Tolman Smith, United States Bureau of Education; *The Ideal School*, Dr. G. Stanley Hall, Clark University; *Progress in Education*, Bishop Spalding; *Social Science and the Curriculum*, Professor George E. Vincent; *English Education*, C. S. H. Breverton. The committee appointed in 1898 to investigate the subject of a national university presented its final report at this meeting, in an admirably clear and concise document, declaring against the proposition of founding a statutory national university of the United States, but offering suggestions of an alternative nature and reviewing the work already accomplished toward that end. The association, however, in receiving the report and discharging the committee made note of the fact that it was not prepared to abandon its previous declarations in favor of a national university. At a later meeting the proposal for a national university was definitely indorsed. (See also **CARNEGIE INSTITUTION FOR RESEARCH**, and the paragraph **National University** in the article, **UNIVERSITIES AND COLLEGES**.) The declaration of principles adopted at the meeting of 1901 is an interesting indorsement of the American system of public instruction, and together with its recommendations for the enlargement of its operations offers an instructive parallel to the principles adopted at the annual conference of Catholic colleges in April. President W. M. Beardshear, of the Iowa State Agricultural College, was elected president of the association for the year 1901-02. Irwin Shepard, Winona, Minn., is the permanent secretary. The active (permanent) membership is nearly 2,500, and the average annual membership about 8,000. The permanent invested fund is \$88,000, yielding an income of about \$3,900.

EDUCATION IN THE UNITED STATES. The present article deals briefly with some of the principal topics of educational interest discussed during 1901. A specific record of the progress of higher education in the United States will be found in the article **UNIVERSITIES AND COLLEGES**.

The University and the Secondary School.—The discussions as to the relation of the university to the secondary school, the question of electives in the secondary school, and the proper basis upon which graduates of secondary schools should be admitted to college—questions which were noted as a prominent feature of Ameri-

can educational thought in 1900—have been even more prominent in the discussions of 1901. Almost half of the articles in the leading American journal on secondary education, *The School Review*, have dealt directly or indirectly with these questions. It is significant that the discussion as to electives has changed entirely within recent years from a discussion as to whether or not the high school course should contain electives to how far the elective system should be allowed. Some of the best articles in the leading educational journals during the year 1901 were upon this question. With the continued discussion of the high school course of study, the question as to what the university has a right to require of the high school has been brought into still greater prominence. One question cannot be considered without the other. From the leaders in secondary education the protest against university dictation has come with increasing force. The idea that a pupil must have four years of Latin, three years of Greek, three years of mathematics, or any number of years of any specific subject, English excepted, in order to be admitted to a university, has seemed so absurd that an increasing number of the larger and more independent secondary schools have asserted their independence and arranged their courses to meet individual and community needs, regardless of university requirements. Many of the leading universities have responded to the demand from the secondary schools and have allowed much greater liberty in the selection of entrance subjects; other universities have resorted to compromise measures; and many others are carefully considering the advisability of a further modification of their entrance requirements. In the changes in entrance requirements made during 1901, an almost uniform tendency toward greater liberality and flexibility is to be noted and it may be confidently asserted that these university changes are a direct result of the discussion as to the province and work of secondary school, which has been so prominent during the past three or four years.

General Progress of the Year.—The year 1901 saw the completion of *The Elementary School Record*, a series of nine monographs describing the work of the experimental school conducted by Dr. John Dewey at the University of Chicago. These form an interesting and valuable record of the work done. The year also saw the union of the Chicago Institute, founded by Mrs. Emmons Blaine, with Chicago University. It was felt by the trustees of both institutions that more good could be accomplished by a union of the two institutions than they could accomplish working separately. The school will in future be known as the Chicago University School of Education. It is understood that the new institution will have an endowment of a million dollars. The Chicago Manual Training School, and the South Side Academy, a private secondary school, have been merged into this new school of education. The new Chicago school thus becomes, in equipment, one of the most prominent institutions in the United States devoted to the professional preparation of teachers and directors of education.

Teachers' College, Columbia University, experienced a wonderful degree of prosperity during the year. The graduate work, organized only four years ago, now outranks the undergraduate work in importance. The year saw the completion of the Horace Mann model school, a magnificent structure built to house a model school of a thousand pupils, and extending from kindergarten to university. A large gift was also received from Mr. and Mrs. James Speyer for the erection of an experimental school in a nearby but less favored portion of the city. This new school will add greatly to the educational resources of the college.

Substantial progress in city school organization was made during 1901. The revised charter for the city of Greater New York, taking effect January 1, 1902, confirms the strong provisions relating to the public-school system which were incorporated in the charter of 1897, and removes some of the defects which a series of compromises had permitted to remain in the earlier charter. Perhaps the most important improvement is the sweeping away of borough school boards, borough superintendents, and borough control of the school, and in their place centralizing the power in the central board of education, providing for a single unified school system for the entire city, and placing a single superintendent in control of the school system. The new school board consists of 46 representatives—22 from the borough of Manhattan, 14 from the borough of Brooklyn, 4 each from the boroughs of the Bronx and Queens, and 2 from the Borough of Richmond. They are to hold office for five years; are to be appointed by the mayor; are exempt from the operation of the general power of removal clause; and a portion are to go out of office each year. The board is to appoint an executive committee of 15, to which extensive powers are to be delegated. It was necessary, in making the change from the old borough plan to a unified city system to concede something to borough sentiment. So it happens that the new board is so large that it is unwieldy, and the delegation of powers to a committee of fifteen—a necessity if business is to be expedited—will doubtless prove a source of trouble, though it will hasten the day when New York will see the necessity of reducing its board of education to a board

of 13 or 15, even, in order that responsibility may be centralized and efficient management secured. The charter provides for the election of a superintendent of schools, a superintendent of school buildings, a superintendent of school supplies, a supervisor of lectures, and eight associate city superintendents, all elected for a term of six years. The board of superintendents is the central administrative body, which has immediate charge of the educational policy of the city and the work of the school system as a whole. This board has large powers and takes the initiative in all important matters. The 26 borough superintendents under the old régime are to become district superintendents. The board of education is to divide the city into 46 local districts, and 23 of the district superintendents are to be given the oversight of two local districts each. These district superintendents are to be given educational but not administrative duties. They are to spend their time in the schools, and are to guide and inspire the teaching force. An innovation in school management, or, more properly, a survival of the old system of district control, is the provision for a local school board for each of the 46 districts of the city, each local board to consist of one member of the central school board, the district superintendent, and three citizens. These district boards are purely advisory and are intended to give voice to local opinion in school matters. They are also calculated to become centres of criticism, though the charter gives them no direct power over the schools, the teachers, or school supplies.

In Chicago the board of education has adopted a provision for free text-books in the primary schools. The chief opposition to the proposal came from the parochial school interests. This, and the meeting of the Association of Catholic Colleges at Chicago in February, 1901, have brought the religious question in education more prominently to the front than before. The year 1884 marked the beginning of a new movement for the establishment of Catholic parochial elementary schools, and since that time the number of such schools has increased rapidly. In 1890 1,000,000 pupils were enrolled and \$25,000,000 were expended, not including colleges or universities. Up to the present the Catholic Church has devoted its energies to the founding of primary and grammar schools, but the Association of Catholic Colleges, at the meeting in February, recommended that in the future especial attention be given to the establishment of high schools. The near future will probably see a well-developed system of Catholic education.

In San Francisco the new charter provisions for the management of the schools are growing more and more unsatisfactory, as it was freely predicted in advance that they would. The paid board, which started out well, seems to have lost control of the situation, and the open rupture with the superintendent, who is a county official elected independently of the board, has weakened public confidence. Until San Francisco can subordinate the superintendent to the board of education, there is little hope for harmony or efficient school control.

A new development in the education of Cuban teachers took place during the year 1901. After some investigation the Cuban authorities selected the State Normal School at New Paltz, N. Y., as the best available place for the education of Cuban teachers, and has sent 80 young girls to this school for a full course of instruction, to cover a period of two or more years. These students are paid \$20 a month while studying, and the Cuban government pays the State of New York for their education. When they have completed their course of instruction, a course that has been especially arranged to meet Cuban needs, they are to return to Cuba and be given responsible positions in the schools. The New Paltz authorities have taken up the problem with great earnestness, and this experiment promises to be one of the most interesting and most successful ever attempted.

The Association of American Universities held its second meeting at Chicago in February, 1901, and made substantial progress, as reported in the *Educational Review* for April, in its work looking toward the unification of American university work for the higher degrees. The Yale bi-centennial celebration of October 20-23, was a most notable event, and called forth a number of valuable magazine articles, one of the most interesting being *The Yale Curriculum, 1701-1901*, by Professor John C. Schwab, in the *Educational Review* for June. The Detroit meeting of the National Educational Association in July was one of the most noteworthy in the history of the Association, both in point of numbers and in the value of the papers read. The active membership of this association reached 2,820 in 1901, having almost doubled in five years. The report of the secretary as to the wonderful growth of this great voluntary association of teachers is one of the most interesting features of the volume of *Proceedings for 1901*.

For agricultural education, see the paragraph on that topic under AGRICULTURE.

Education in the Insular Possessions.—The report of the Philippine commission shows very substantial progress in providing education for the Filipino children. An education bill was enacted and \$1,500,000 were voted out of the insular revenues for the support of schools. A normal school has been established

at Manila; schools have been organized in most of the provinces that have been reduced to order; and about 600 superior teachers have been taken to the islands from the United States. In Cuba great progress has been made. The census taken in 1899 showed that 63.9 per cent. of the population were unable to read, and only 200 schools in the island. At present there are over 5,000 teachers at work, and the number is rapidly increasing. Hawaii has long had an excellent system of schools. The last report of the minister of public instruction that is available shows an enrollment of 15,490 pupils. It is only from Porto Rico that very recent statistics are at hand. In a letter written toward the close of 1901 the commissioner of education for the island writes as follows: "We maintain school in Porto Rico nine months. Our average daily attendance for the past year has been 75 per cent.; only 1 per cent. lower than Massachusetts. Under the military government there were 612 schools; May 1, 1900, there were 800 schools; and September 30, 1901, there were 1,000 schools. A year ago there were less than 100 American school desks here. We have put in 7,000 the past year, and during the present year will add 7,500 more. In January, 1901, we had not one schoolhouse of our own in Porto Rico. We now have 18 agricultural schoolhouses and 8 more in process of erection; and 18 four-room brick graded schools, 1 six-room school, and 3 two-room schools will be ready by October 1, 1901. An insular normal school will be ready by November 1. The value of permanent equipment added in six months is \$265,000. We have petitions for more schools daily—the demand greatly exceeds supply. Our limit is money. We have \$500,000 in this year's budget for schools, which is 25 per cent. of all insular funds. This represents only our financial, not our educational, growth. We could have voted \$1,000,000 and had support from public sentiment. But we knew our financial limits. The main objection to the budget was that the school fund was too small. We have 55 pupils in many schools, and as many as 124 in some places on waiting lists. Spain had but few schools—only one in terms. The poorer communities never had a school. We have now opened over 600 rural schools."

Literacy of Adult Population in the United States.—As shown by the returns of the census taken in 1900, there were in the United States at that time 21,329,819 males of voting age, of whom 10,636,898 were natives born of native parents, 3,466,721 were natives born of foreign parents, while 4,932,524 were foreign whites and 2,065,989 were negroes. Of the natives born of native parents, 5.8 per cent. were illiterate; of the natives born of foreign parents, 2 per cent. were illiterate; of foreign whites 11.5 per cent. were illiterate, and of negroes 47.3 per cent. were illiterate. Chinese, Japanese, and Indians not included in the above summary were illiterate to the following extent: Chinese, 31.3 per cent.; Japanese, 33.9 per cent., and Indians, 65.1 per cent. From this it is seen that of all the elements of population in the United States, the negroes, with the exception of the Indians, whose number is comparatively so small as to be of little practical importance, are by far the most illiterate. The table on the opposite page gives for each State and Territory the total number of males of voting age by classes, and the degree of illiteracy of each class. A more detailed statement of the comparative literacy of negroes in the various States will be found under the article **NEGRO PROBLEM**. With regard to the comparative literacy of other elements of the population, it is very difficult to make deductions from the returns given by the census and tabulated below, for the reason that discrepancies between the States are so large as in many instances to seem unaccountable. In general, however, it will be noted that wherever the foreign population is very large, either numerically or in proportion to the total number of inhabitants, the degree of illiteracy is correspondingly large. Thus Massachusetts, which is generally spoken of as the foremost State educationally in the Union, has an adult male foreign population exceeding its strictly native population; and while the illiteracy of the natives is only 0.6 per cent., the illiteracy of the foreign whites is 13.8 per cent., a larger average than that for the entire country, including the undeveloped and mining States, where education is somewhat backward. The southern States very commonly show a comparatively large proportion of illiterates for both native and foreign population, and this high ratio is the more significant, since the large bulk of the illiterate negroes are also located there. Speaking broadly, it will be observed that illiteracy tends to decline in the rural sections of the country, especially those sections where small agricultural holdings are the rule; and where those same States show a large number of foreign whites and a proportionately large degree of illiteracy among them, it may often be safely assumed that these foreigners have been drawn to the State either on account of mining or mechanical industries or to work on extensive farms and ranges. Considering the comparative illiteracy of the different elements of the population, the States apparently most in need of more schools are Louisiana, New Mexico, and some of the southeastern States.

Statistics.—The development of public education in America in the past ten years has been remarkable. Though the population has increased only about one-fifth, the expenditure for common schools has almost doubled. 1889-90 the expenditure for common schools was \$140,506,715; in 1899-1900 it was \$213,274,354, and in 1900-01 it was close to \$220,000,000. The increase in the length of the school term and the number of days the average child attended school has been marked. Counting a year of schooling as 200 days, the entire number of years of schooling received by the average child of the population, counting all public and private education, of whatever grade, has been as follows: 1800, 0.41 year; 1840, 1.04 year; 1850, 2.25 years; 1860, 2.17 years; 1870, 3.36 years; 1880, 3.96 years; 1890, 4.46 years; 1900, 4.99 years. The school enrollment has doubled since 1870.

Attendance in, and Expenses of, Public Schools.—The statistics of the attendance of pupils in the public schools of the United States and the expenses incurred for these schools, as prepared by the commissioner of education for the school year ending June 30, 1900, exhibit several interesting results. Dividing the States into the five main groups given in the table below, that is, into the North Atlantic, South

Atlantic, South Central, North Central, and Western divisions, it appears that the total population of these groups, as given by the census in 1900, was: North Atlantic, 20,988,795; South Atlantic, 10,400,937; South Central, 13,568,457; North Central, 26,262,408, and Western Division, 4,052,086. Now, on the basis of these respective populations, it would be expected that, except in the North Atlantic States, where there are many more private schools than in any other section of the country, the average attendance of pupils and the total expenditures incurred for public schools would be in about the same ratio as the total population in the several sections. Such, however, is not the case. For considering the total expenditures for public schools, which, on the whole, probably gauges fairly accurately the actual efficiency and amount of education offered, it is seen that the North Atlantic Division, with a total population of nearly 21,000,000, expended in 1900 \$83,500,000 for schools, while the North Central Division, with a population of 26,000,000, expended less than \$1,500,000 more. On the other hand, the South Atlantic and South Central divisions, with a combined population exceeding that of the North Atlantic Division and only 2,000,000 less than the population of the North Central Division, expended together only \$28,500,000, or about one-third of the amount expended in either the North Atlantic or North Central Division. On the other hand, the Western Division, with a population considerably less than one-half of the South Atlantic Division, expended \$16,500,000, or more than either the South Atlantic or South Central Division. If the figures of school expenditure for the States of the South Atlantic and South Central divisions are considered more in detail from the figures given below, it will be noticed that, speaking broadly, and therefore, inaccurately, the amount of expenditure per capita for schools tends somewhat to vary inversely in accordance with the negro population of the State. That is to say, in States like North Carolina, South Carolina, and Alabama, where the industrial system depends largely upon negro labor, and where manufactures have not yet entered to a considerable extent, as they are tending to do in West Virginia, the amount of money expended *per capita* for public schools is smaller than in other southern States which are recovering from the effects of the Civil War and the reconstruction period.

The estimated number of children between 5 and 18 years of age in the five divisions of States is as follows: North Atlantic Division, 5,328,300; South Atlantic Division, 3,542,890; South Central Division, 4,705,410; North Central Division, 7,692,680; Western Division, 983,770. Of these pupils the total enrollment in the school year ending June, 1900, was 15,341,220, divided as follows: North Atlantic Division, 3,633,240; South Atlantic Division, 2,174,083; South Central Division, 2,912,698; North Central Division, 5,823,019; Western Division, 798,180. The actual average daily attendance throughout the school year was 10,389,407, or about two-thirds of the enrollment, and less than one-half of all the children of school age. The daily attendance has been given in the table below instead of the enrollment, which is more usually given, from the belief that the daily attendance and not the nominal enrollment is the real basis from which to draw inferences regarding the facts and needs of the educational system of the United States. The average number of days during which schools were kept during the year was 144.6 for the United States, and for the several divisions making up this average, as follows: North Atlantic, 177.1; South Atlantic, 112; South Central, 99.7; North Central, 155.6; Western Division, 145.7. At the same time the average number of days attended by each enrolled pupil during the year was 99.1 for the United States, and for the several divisions was as follows: North Atlantic, 128.3; South Atlantic, 68.3; South Central, 66.6; North Central, 108.7; Western Division, 99.2. The larger average attendance of pupils in the North Atlantic Division is probably due not only to the excellence of the school system in those States, but also to the larger number of schools, and more especially to the shorter distances which pupils have to travel. The reverse of these conditions also largely accounts for the slight attendance in southern schools; but here it should be borne in mind that the finances of many of the southern States have never been on a stable basis since the great debts incurred in the reconstruction period, although earnest efforts have been made lately to lengthen the school term.

The subjoined table, compiled from figures made public by the commissioner of education, shows (1) the estimated number of children in the United States in 1900 between 5 and 18 years of age, (2) the actual average daily attendance in all public schools of the United States for the school year ending in June, 1899, (3) the actual average attendance for the year ending June, 1900, (4) the average length of school terms in the year 1899, (5) the average length of school terms in 1900, (6) the total expenditure incurred for public schools in 1899, and (7) the total expenditure incurred in 1900.

For statistics concerning public and private high schools, universities, and colleges, normal schools and professional schools, see articles SCHOOLS, UNIVERSITIES AND COLLEGES, NORMAL SCHOOLS, and PROFESSIONAL SCHOOLS.

New Books.—A few of the more notable new books published during 1901 are *School Hygiene*, by Edward R. Shaw (N. Y.); *Source Book on the History of Education for the Greek and Roman Period*, by Paul Monroe (N. Y.); *Pestalozzi*, by A. Pinloche (N. Y.); *College Administration*, by Chas. F. Thwing (N. Y.); *Notes on Child Study*, by Edward L. Thorndike (N. Y.); *Student Life and Customs*, by H. D. Sheldon (N. Y.); *The New Basis of Geography*, by Jaques W. Redway (N. Y.); *Teaching of Latin and Greek in the Secondary School*, by Charles E. Bennett and George P. Bristol (N. Y.); *The Teachers College Record*, Vol. II. (N. Y.); *The Elementary School Record* (Chicago); *Classified Bibliography of*

Books on Education in the Libraries of Columbia University (N. Y.); and the republication of *Barnard's American Journal of Education*, 31 vols. (Syracuse, N. Y.).

EDWARD VII., KING OF GREAT BRITAIN AND IRELAND, who succeeded to the throne Jan. 23, 1901, upon the death of Queen Victoria, was born Nov. 9, 1841. His early education was carried on by tutors, under the supervision of his father, the Prince Consort, and afterward he studied at the universities of Edinburgh, Oxford, and Cambridge. In 1860, as Prince of Wales, he visited Canada and the United States. Two years later, accompanied by Rev. (afterward Dean) A. H. Stanley, he made a tour of the East, including the Holy Land. On March 10, 1863, the Prince was married to the Princess Alexandra, eldest daughter of Christian IX., king of Denmark; six children were born to them, of whom the Duke of York, now Prince of Wales and heir apparent to the throne, is the second. He was born June 3, 1865. Prince Albert Edward visited India in 1875, and in 1885 he made a trip through Ireland. During his long experience while Prince of Wales, as the personal representative of Queen Victoria, he displayed unusual tact and balance. Shut off from active participation in political life, he turned with enthusiasm to the task of building up a brilliant court circle, and won for himself in time the title of "social umpire." He was interested in horses, owning many famous racers; he was attracted by all out-door sports, and he lived as a man of the world. As prince he was invariably genial, and his personal popularity did not suffer on account of his devotion to sport and society. Beyond this, he has proved himself a man of sound common sense. The duties that have belonged to him he has discharged promptly and well. Much public speaking has fallen to him, as presiding officer at public dinners, at the opening of hospitals and public institutions, and as chairman of committees. The impression he produced on these occasions has been summed up in these words: "He speaks directly and to the point. He never obtrudes himself between the audience and the business of the occasion. He never uses the wrong word, and he never says a word too much. He puts as little of himself as possible into his speeches, and while there is always a firm and manful tone about him, there is never any indication whatever of a desire to impose himself and his position on his audience." Another writer, speaking of his diligence as a member of important committees, says: "As a chairman of a committee, every one agrees that he is admirable. . . . In such institutions as the Royal Agricultural Society, of which he is a member, he has set an example to other members for the painstaking care with which he attends their meetings and participates in their discussions." Other institutions in which, as Prince of Wales, he took an active interest, were the Imperial Institute and the Royal College of Music; and he was a member of the Royal Commission for the Housing of the Poor, and the Commission for the Treatment of the Aged Poor. As king, Edward VII. has shown the same conservatism and balance of judgment which characterized his earlier career. He has not interfered with the policy of his ministers, but has followed scrupulously the principles of government established by Victoria. For the United States the king has already exhibited a friendly interest, an interest which developed during his years of intercourse with many Americans while heir-apparent.

EDWARDS, ARTHUR, D.D., American religious editor, died in Chicago, March 20, 1901. He was born in Ohio in 1834 and graduated at the Ohio Wesleyan University in 1858, commencing his career as a Methodist preacher in the same year. He served through the Civil War as chaplain of a Michigan regiment, and later as a colonel of cavalry, and at its close became assistant editor of the *North-western Christian Advocate*. In 1872 he became editor-in-chief, and as such achieved prominence in religious circles. He was a delegate to six general conferences of his church, and an active member of the Ecumenical Conference in London, 1881.

EGYPT, a state of northeastern Africa nominally under the suzerainty of Turkey, but practically under the influence and protection of Great Britain. The capital is Cairo.

Area, Population, and Education.—The estimated area of Egypt proper—that is, the territory north of the 22d parallel—is about 400,000 square miles; the cultivated and settled area, however, amounts to only about 13,000 square miles. The census of June, 1897, showed the population to be 9,734,405, of whom 573,974 were nomads. Cairo had 570,062 inhabitants, and Alexandria, the chief commercial centre, 319,766. Of the total population, about 92 per cent. is Mohammedan. There are many government, Coptic, and Mohammedan schools. In his annual report published in 1901, Lord Cromer, the British financial adviser, stated that it is unwise to encourage purely academic instruction. He said that the desire for government positions, for which there are already too many applicants, had created too great a tendency to literary education; and since the demand for craftsmen and artisans, as well as engineers, skilled agriculturists, etc., is greater than the supply, he was determined to encourage technical instruction—such instruction, of course, involving a good primary education.

Government and Finance.—The head of the government is the khedive, Abbas Hilmi, who ascended the throne in January, 1892. The heir-apparent is Prince Mohammed Abdul Mouneim, who was born February 20, 1899. The final legislative authority is vested in the khedive and his ministers. The khedive has a yearly allowance of £100,000. The annual tribute paid to Turkey amounts to about £660,000.

Since 1883 Lord Cromer has been financial adviser to the Egyptian government. Although he is not recognized as an executive officer and has the title of consul-general, he is practically governor-general of the country, and without his consent no financial measures can be enacted. The chief sources of revenue are the land tax, the tobacco monopoly, customs, and railways; the largest items of expenditure are service of the debt and internal administration. The revenue and expenditure in 1899 were £E11,200,303 and £E9,929,442 respectively; in 1900, £E11,447,095 and £E9,895,224. (The Egyptian pound is worth \$4.9076.) The figures for revenue here given are exclusive of balances from preceding years. Such surplus in 1900 amounted to £E1,552,000; of this sum £E559,000 belonged to the Egyptian government, £E666,000 were paid to the general reserve fund, £E265,000 (saving effected by conversion economies) were paid to the economies fund, and £E62,000 were paid to the sinking fund. These figures show in the Egyptian revenue an elasticity that "bears eloquent testimony to the success of Lord Cromer's administration." In his annual report he called attention to the fact that, while in the four-year period from 1883 (the beginning of British occupation) to 1886 the aggregate deficit amounted to £E2,606,000, during the fourteen years from 1887 to 1900, inclusive, the aggregate surplus reached the sum of £E9,986,000. This improvement in the public finance was effected "in spite of large reductions of taxation [£E203,000 of land tax were remitted in 1900 on account of the low Nile], of heavy expenditure upon public works, and latterly of a heavy charge on account of the Soudan, amounting for last year to over £400,000." The estimated revenue and expenditure for 1901 were £E10,700,000 and £E10,636,000 respectively. According to the budget for 1902 the estimated revenue is £E11,060,000, and the expenditure £E10,850,000. If to this surplus of £E210,000 be added the several sums for amortization of the debt, the real excess of receipts would amount to £E944,000. Various economies are effected in the army, pension, and other expenses, and it is proposed that the savings thus realized be used for various reforms and administrative improvements. This budget is "the most satisfactory one hitherto produced, affording a striking proof of the great increase in the country's prosperity during recent years." The consolidated debt in 1900 amounted to £E103,049,040.

In Egypt, as in all oriental countries, the money lenders constitute a large non-productive class. To protect the fellahen from extortionate rates of interest, the government carries on, as an experiment, a loan system at 10 per cent. The working out of such a system has been attended with difficulty, partly because of the unintelligent opposition of the fellahen to any innovation, and partly because of the natural difficulty of securing payment from an irresponsible peasant class. Considerable success, however, has been achieved in the plan adopted, which, in general, is that the banks lend and the government collects. To push the business the banks employ agents, who receive 1 per cent. commission, and honesty in the drawing up of contracts is insured by the supervision of English inspectors. The loans are paid, usually in installments, along with the ordinary taxes, to the government tax collectors. The banks assume all risks, which, with the method of governmental collection, do not seem to be very great.

Army.—The Egyptian army has a total strength of about 15,500. The annual cost for maintenance is nearly £E440,000. The commander-in-chief is a British officer, called the sirdar. This officer, since December, 1899, has been General Sir Reginald Wingate. The British army of occupation numbers about 4,500 men; for the maintenance of this force the Egyptian government makes an annual appropriation of £E87,000. There is no effective navy.

Industries and Commerce.—Agriculture, made possible by the Nile overflow, is the principal industry, and cotton, sugar, and cereals are the leading crops. In 1886 the cotton production, in cantars (99.049 pounds), amounted to 2,923,450; in 1890, 3,183,000; in 1900, 6,509,645. In the foreign trade, imports and exports, exclusive of specie, have been respectively: 1898, £E11,033,219 and £E11,805,179; 1899, £E11,441,802 and £E15,350,908; 1900, £E14,112,370 and £E16,766,609. The leading imports in 1900 were: Cotton textiles, £E1,987,095; metals and metal wares, £E1,817,971; cereals, vegetables, etc., £E1,532,341; animals and animal food products, £E652,357; tobacco, £E577,203. The most important exports for the same year were: Raw cotton, £E13,039,003 (4,868,596 cantars); and cereals, vegetables, etc., £E2,615,433. Trade with countries commercially the most important was as follows in 1899 and 1900:

IMPORTS TO EGYPT.

Communications.—At the beginning of 1901 there were in Egypt, exclusive of the Soudan military railway, 1,393 miles of rails owned by the state and 670 miles of rails (light agricultural lines) owned by private companies. The total receipts from the state railways in 1900 were £E2,158,878 and the working expenses £E971,495. The military railway extends to Khartum, 1,331 miles from Cairo. The state telegraph lines at the beginning of 1901 had a length of 2,106 miles with 9,440 miles of wire. See SUEZ CANAL.

Arabi Pasha.—In December, 1900, the British government, and in May, 1901, the khedive, pardoned Arabi Pasha, the ostensible leader of the revolt of 1882, who was exiled to Ceylon after the British occupation. His return to Cairo on September 30 was not regarded as having any political significance, since it is now believed that Arabi was a man of no great ability, having been in fact little more than a puppet in the hands of men like Mahmud Sami and Ali Roubi. He had become, indeed, a pathetic figure; for the nineteen years of exile had transformed the violent revolutionist into an unambitious old man, content with British rule. He acknowledged that England had given to Egypt all that he himself fought for. Accordingly he provoked the indignation of the anti-British party. The following statement from the *Egyptian Gazette* is indicative of the spirit in which this party received him: "He is met by a chorus of groans from the ignorant and of curses from those whose interest lies in stirring up and maintaining agitation against the British occupation."

For Egyptian archæology, see the article ARCHÆOLOGY (paragraph Egypt).

Egyptian Soudan.—The Egyptian Soudan, which extends from the 22d parallel of latitude southward to Uganda, and is bounded on the east by the Red Sea, the Italian colony of Eritrea and Abyssinia, and on the west by the French Sahara and French Congo, was in a comparatively peaceful state during 1901. The last of the khalifa's generals, Osman Digna, had been overthrown in 1900, and no further opposition from the Dervishes to the English administration presented itself. The main efforts of the administration, at the head of which is the sirdar and governor-general, Sir Reginald Wingate, with Sir Rudolph Slatin as inspector-general, were directed toward the rehabilitation of communications and industries in the territory. For administrative purposes, the Soudan is divided into six first-class provinces, Khartum, Dongola, Berber, Kassala, Sennar, and Kordofan, and in three second-class provinces, Wady Halfa, Suakin, and Fashoda. Ashanan was incorporated September 9, 1900, with Egypt. Military governors have been appointed over each of these provinces. Both the revenues and expenses of the Soudan for 1901 increased; the revenues amounted to £E187,500, an increase of £E29,000 over the revenues of 1900; the expenses for 1901 amounted to £E604,679, an increase of £E29,000 over the similar item in the budget of 1900. The deficit of £E417,179, which is about the same as the deficit of 1900, was made up by Egypt. The extra revenue was spent mainly in developing the country. The most important operation undertaken by the government was the clearing of the Nile of the compact mass of sudd which had choked the river and checked communication. The operation of cutting out this sudd was begun in 1900, and the last block was taken out in 1901, so that the river is now clear to Gondokoro. It is expected that much of the trade of the Congo State will pass up the Nile on its way to Europe.

In August Sir W. E. Garstin, who had been sent to inspect communications and also to inspect the headquarters of the Nile with a view to deciding upon the feasibility of damming one of the great sources of this river so as to produce a constant reservoir for irrigation, made his report, and this was published as a Blue Book. After examination of Victoria Nyanza and Albert Nyanza on the White Nile, and Lake Tsana on the Blue Nile, he reported in favor of the plan for damming the latter body of water. A dam which should raise the level of the lake three feet would store enough water, allowing for evaporation, not only to furnish Egypt and the Soudan with an abundant supply for irrigation, but also to improve the navigation of the Blue Nile during the summer. The objection made by other experts to this plan is based on the fact that the lake is in the territory of King

Menelek, and in case of a war with Abyssinia the Soudan and Egypt might find their water supply suddenly cut off. Among other projects for the reestablishment of communications in the Soudan was the construction of the telegraph line which had been built as far as Khartum in 1900 southward down the White Nile to Fashoda and northeastward up the Blue Nile to Kassala. The necessary wire for this plan, 16,000 kilometres, was waiting at Khartum in 1901 until operations should begin.

It was also proposed to continue the railroad from Khartum to Fashoda, and another road across the desert, from Khartum, by way of Abuharaz, Gedaref, and Kassala to some harbor on the Red Sea, was projected.

The Soudan was declared open to trade in 1899, and several development companies were organized in London to export guns, ostrich feathers, ivory, and valuable woods; but in the first place communication to Egypt was not easy, and, moreover, the country had been devastated by the slovenly policy of the Mahdi and his successor, and, furthermore, trade in articles similar to those produced in the Soudan had been developed in other parts of Africa during the sixteen years in which the region had been lost to civilization. Therefore the success of these companies was not so great as had been hoped.

EICKHOFF, ANTHONY, editor and author, died in New York City, November 6, 1901. He was born at Lippstadt, Westphalia, in 1827, and came to the United States in 1846. In 1848 he founded the *St. Louis Zeitung*, and later edited the *Nordwestlichen Demokrat* at Dubuque. He went to New York City in 1852 to become editor of *Der Abendpost*, and later (1854-56) he edited *Die Staats-Zeitung*. During the Civil War he was commissary-general for the New York troops, and was elected to the State legislature in 1863. In 1876 he was elected to Congress, and from 1891 to 1896 he was fire commissioner of New York City. Mr. Eickhoff wrote *The German in America*, a discussion of German immigration—a subject in which he was deeply interested.

ELECTRICAL ENGINEERING. The year 1901 exhibited general progress and prosperity in all branches of electrical engineering. Some of the most notable advances recorded in special fields of electrical work are noted in detail in the articles referred to at the end of this article. Here attention will be confined to presenting a general bird's-eye view of the whole field of progress in the application of electricity to practical uses. Starting first with electrical communication of signals, telegraphy calls for first mention, because of the notable accomplishment of Marconi (*q.v.*) in flashing wireless signals across the Atlantic Ocean. This most notable result rather dwarfed the other and less striking advances made in the same field, and gave rise to much speculation and prophesy concerning the commercial possibilities of this new means of electrical communication. It is doubtless a field of vast possibilities; but it must not be forgotten, nevertheless, that competent authorities have borne witness that it will be a far cry from the experimental flashing of signals across the Atlantic to the commercial perfection of trans-oceanic wireless telegraphy. (See **WIRELESS TELEGRAPHY**.) In the field of general telegraphy by wire the growth has been moderate. Telephony, on the contrary, exhibited a remarkable growth during 1901. At the end of the year it was estimated that there were fully 1,000,000 Bell telephone stations in the United States, as compared with 800,000 stations in operation twelve months previous, or an increase of quite 25 per cent. These figures do not include the stations of the "independent" companies, which also show a marked growth in number. Technically there have been several notable developments in telephony during the year. Progress was made with the practical development of Professor Pupin's invention of improved circuits, enabling speech transmission for greater distances and with greater clearness than was possible before. During the year the "telegraphone," or recording telephone, was introduced, but was not put in commercial form. The employment of "central energy," lamp-signaling methods, and automatic exchanges also made progress. In electric lighting the progress of the year was along established lines. Perhaps the most notable single item of progress was the enormous advance made in the size of generating stations. The most notable example of these recent giant plants was that of the New York Edison Company, which when completed will deliver 150,000 horse-power of electrical energy for lighting New York City. A notable item of the year's work, from a mechanical point of view, has been the adoption in several notable instances of steam turbines instead of reciprocating steam engines for driving electric-lighting dynamos. At the other end of the line, the year 1901 presents notable advances in the use of the Nernst lamp, where an incandescent substance glows without consumption in open air, and in the development of the Cooper Hewitt tubes, in which a mercury vapor glows with remarkable brilliancy. (See **ELECTRIC LIGHTING**.) In the field of electrical traction, besides the general growth of city electric roads, the year recorded an enormous development of high-speed interurban lines; the electrical equipment of the Boston

elevated and New York elevated railways, and some of the London "tube" railways; and the high-speed tests made on the German military railway between Berlin and Zossen. Among the projects of the year which were significant as indicating the position of electric traction may be mentioned the proposal of the Pennsylvania Railroad to tunnel from Jersey City to Brooklyn, passing under the North and East rivers and Manhattan Island, with a double-track underground line operated by electric power. (See TUNNELS.) In the long-distance transmission of power in the year 1901 a record was established in the Bay Counties (California) transmission line, which, from generators driven by water-wheels in the Sierra Nevada mountains, carry current 222 miles to San Francisco Bay at potentials of 40,000 and 60,000 volts. (See ELECTRIC POWER TRANSMISSION, LONG DISTANCE.) Telpherage is another means of electric transportation which has made notable advances during 1901. (See TELPHERAGE.) In the operation of automobiles by electricity the year exhibited but little advance. In the field of electric heating a technical advance was recorded by the introduction of heaters consisting of thin strips of mica coated with metallic paint. The increasing use of electric motors in factories and shops to run machinery was a notable feature of the year's progress. An attempt to itemize the establishments in which electric-power driven machinery was installed during the year would present the task of naming about every new factory of magnitude and importance built during the year. See STORAGE BATTERY (EDISON), ELECTRIC LIGHT AND POWER, WIRELESS TELEGRAPHY, ELECTRIC POWER TRANSMISSION, TELPHERAGE.

ELECTRIC FOUNTAINS. See ELECTRIC LIGHT AND POWER.

ELECTRIC LIGHT AND POWER. The number of commercial electric lighting stations in the United States on September 1, 1901, was 2,842, and the nominal amount of capital invested in the same was about \$669,000,000. The geographical distribution of stations and capitalization is shown by the accompanying table, taken from the *Electrical Review* for November 9, 1901. The number of stations is not far from correct, being rather too low than too high. The capitalization is the sum of outstanding stocks and bonds, so the actual cash investment may not be more than \$300,000,000 to \$400,000,000. It should be understood, also, that the investment includes long-distance power transmission plants for the utilization of water power. Central stations are constantly increasing in size, due not only to consolidation of companies, but to a centralization of all the electrical generating apparatus in a city or group of cities. In place of the former small generating stations scattered about a city or district, sub-stations receive the current of high potential from the main power station, convert it as may be desired, and send it out to the consumers. Thus the great waterside station of the New York Edison Company sends out current to 16 sub-stations on Manhattan Island and one north of the Harlem River. At the main station there are 16 General Electric 4,500-kilowatt three-phase generators, delivering 25-cycle alternating current at 6,600 volts. Underground cable feeders convey this high-tension current to the rotary convertor sub-stations. In some of these sub-stations generating plants are used, but only three of them will continue to be used, and they will be operated as supplementary to the waterside station at time of maximum load. The rotary converters change the current from alternating to direct, and static transformers are employed to reduce the voltage from 6,300 to as low as 170 if desired.

Table of the electric-lighting industry in the United States, from the *Electrical Review*, November 9, 1901:

State.	Stations.	Capital.	State.	Stations.	Capital.
Alabama	23	\$2,372,500	Maine	47	\$5,113,100
Arizona	9	836,500	Maryland	28	3,700,500
Arkansas	28	2,100,000	Massachusetts	101	45,375,000
California	93	50,192,975	Michigan	147	10,558,745
Colorado	45	19,705,000	Minnesota	104	7,384,150
Connecticut	39	21,384,000	Mississippi	20	1,879,000
Delaware	7	449,000	Missouri	103	25,472,520
District of Columbia...	2	2,000,000	Montana	21	2,259,400
Florida	17	1,073,000	Nebraska	32	2,480,900
Georgia	37	2,132,000	Nevada	4	360,000
Idaho	12	275,000	New Hampshire	40	54,632,015
Illinois	258	30,156,550	New Jersey	62	64,429,000
Indiana	134	11,525,507	New Mexico	5	255,000
Indian Territory	4	73,500	New York	102	102,056,000
Iowa	146	7,496,200	North Carolina	33	2,305,200
Kansas	53	2,947,500	North Dakota	11	542,000
Kentucky	43	6,172,800	Ohio	188	21,879,700
Louisiana	15	2,259,400	Oklahoma	6	395,000

State.	Stations.	Capital.	State.	Stations.	Capital.
Oregon	31	\$5,164,950	Utah	8	\$23,106,000
Pennsylvania	228	110,008,000	Vermont	37	1,500,300
Rhode Island	12	4,708,000	Virginia	40	9,906,500
South Carolina	19	5,106,000	Washington	38	12,962,300
South Dakota	20	804,000	West Virginia	33	1,711,300
Tennessee	40	2,533,300	Wisconsin	93	22,685,600
Texas	97	3,968,400	Wyoming	9	927,000

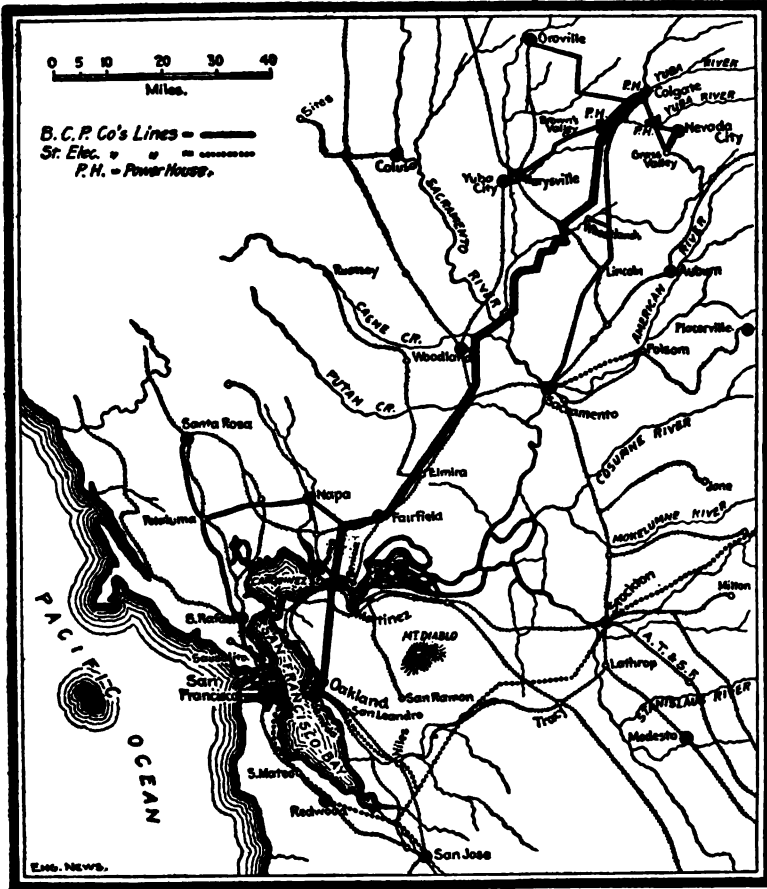

Patents for two new kinds of electric lamps were granted by the U. S. Patent Office in 1901. One group of patents was issued to Peter Cooper Hewitt, for mercury vapor or gas lamps, and another group to Dr. Nernst and several Americans who have been developing the Nernst electric glow lamp in the United States. Neither of these lamps appears to have been put upon the market up to the close of 1901, but both have been used on regular lighting circuits. In the Cooper Hewitt lamp an electric current is passed from one electrode to another through a medium of mercury or other vapor inclosed in a glass tube. In the Nernst lamp the current is passed through a small rod composed of rare earths, such as 70 per cent. of zirconia (oxide of zircon) and 30 per cent. of yttria (oxide of yttrium). In both the Cooper Hewitt and the Nernst lamps, the medium must be heated by some independent means before the desired light is obtained. To provide this preliminary heat and to regulate the lamp has required a large amount of patient investigation. In the *Electrical World and Engineer* for August 31, 1901, there is a long article on *The Development of the Nernst Lamp in America*, by Mr. Alex. Jay Wurts, who, with Messrs. Henry Noel Potter and Marshall I. Hanks, carried on the development of the lamp in America. In the same journal for November 9, 1901, the patents in question are described. The Cooper Hewitt patents are described at length in the issue bearing date September 28, 1901.

Spectacular Illumination.—During 1901 three articles on spectacular illumination were contributed to the *Electrical World and Engineer* by Luther Stieringer, consulting electrical engineer for the Pan-American Exposition. In these articles the history of the development of the electric fountain, the electric tower, and exposition lighting by electricity is described. Luminous fountains were built long before the Christian era. At first the sources of light were candles, fagots, or oil, supplemented by reflectors. Later gas and calcium light were used, and rendered more effective by the use of colors. Electricity was first used for fountain illumination by Sir Francis Bolton, of England, in 1884. A timber operating chamber was placed within the fountain basin in which the piping and the apparatus were concealed. In the roof of the chamber were glass-inclosed light shafts, each having various forms of water jets issuing from their surfaces. The color effect was secured by sliding frames of colored glass. The following year the first luminous fountain in America was built by the St. George's Amusement Company, of Staten Island, N. Y., with Mr. Stieringer as consulting engineer. At the Paris Exposition of 1889 the electrical fountain was a great success, but was surpassed, both in beauty and complexity of design, by the electrical fountain at the World's Columbian Exposition of 1893. Since that time electrical fountains have been prominent objects at all the expositions which have been held, and have also been constructed as permanent decorations of several public parks. Referring to the electric fountain at Prospect Park, Brooklyn, the writer adds: "The success of an electric fountain as a spectacular display depends chiefly on a suitable site and a dark environment, two conditions which are absolutely essential to success." The first object approximating a tower on which electric lights were placed for spectacular effect was a small Christmas tree which Mr. E. H. Johnson, then president of the Edison Light Company, fitted up in 1882 for the amusement of his children. The tree was decorated with miniature lamps, which were colored by being covered with different colored silks. A year later a much more elaborate tree was fitted up by the ladies of Boston at the Foreign Exhibition, and proved to be the feature of the exhibition. The tree was decorated with 160 10 and 16 candle-power lamps, and these various circuits on the tree had different colored lamps, which were turned on and off or "played" in time to music. This was accomplished by means of a switchboard concealed from the audience, which was manipulated by an operator who understood the music. At the Louisville Exposition of 1883 an illuminated circular tower, 30 feet high, was shown which was incrustured with incandescent lamps, arranged in designs and partly covered with colored glass. At the Electrical Exhibition held in Philadelphia in 1884, and again at the Paris Exposition of 1889, there were illuminated towers and after this at a number of indoor exhibitions electrical towers were prominent features. At the Minneapolis Industrial Exhibition of 1890 the "Egyptian Tower of Light" was displayed. This was a column 60 feet high, in the form of a lotus flower. The long stalk was studded with changing lights, manipulated in time with

the music of an orchestra. The surface lighted on this tower was over 4,000 square feet, and on it were 10,000 5-candle-power lamps. At the Columbian Exposition the Edison tower had a prominent place in the electrical building. At the Pan-American Exposition the electrical tower was the principal illuminating feature of the exposition. (See PAN-AMERICAN EXPOSITION.) Passing on from the spectacular illumination of fountains and towers to that of exposition grounds and buildings as a whole, Mr. Stieringer points out that in order to be effective illumination must consist of many small lights, to avoid glare and obtain a diffused light. Indeed, the individual lights must be so small as to give little light separately, and be so grouped, massed, and distributed as to produce the desired effects without raising any point of space to a brilliancy disagreeable for the eye to rest upon. Formerly large units of light have been depended upon to bring into greater prominence the beauties of surrounding effects. To continue in the language of Mr. Stieringer: "The artist upon light looks upon any subject just as a painter does upon a landscape. He has to compose a perfect picture by means of the disposal of illumination, and he must be judged by the resultant whole. For example, to erect huge wooden masts outside the buildings would dwarf the structures. A sea of lights in the paths and lawns would reduce the buildings to islands of darkness. To make each building a blaze of light would blot out the grounds. So that the study of distribution and diffusion becomes for a lighting expert not only a severe problem, but a fascinating and absorbing pursuit." For danger to firemen from electrical wires, see FIRE PROTECTION.

ELECTRIC POWER TRANSMISSION, LONG DISTANCE. The year 1901 saw electric power transmitted on a commercial scale to a greater distance than was ever previously done. This task was performed by the Bay Counties Power Company, of California, whose transmission line runs from the company's powerhouse in the Sierra Nevada mountains to the city of Oakland, on San Francisco Bay, 142 miles. Here connection is made with the lines of the Standard Electric Company, extending to Redwood City, 49 miles farther, and here connection is made with the wires of the Consolidated Light and Power Company, extending to Burlingame, 11 miles farther, making a total distance of transmission of 202 miles. In addition to this series of lines there is a second, made up of the Bay Counties Power Company's 142-mile line to Oakland and the Standard Company's 76-mile line from Oakland to Stockton, a total distance of 218 miles, and a third made up of the 142-mile Bay Counties line and the Standard Company's line to San Francisco, a total distance of 222 miles. The pressures used on these lines is from 40,000 to 60,000 volts. Previous to their completion, the longest electric transmission line in commercial operation was that from the San Bernardino mountains to Los Angeles, California, a distance of 80 miles. This line operated under a pressure of 33,000 volts. Such a long step in advance of previous practice as that recorded by the new Bay Counties line constitutes, it need hardly be said, an engineering precedent of great interest, and it deserves a high position among the electrical events of the year. The following is a brief description of this record-breaking power transmission plant. There are three power stations situated on the various forks of the Yuba River, in the Sierra Nevada Mountains. The plant which supplies power to the Oakland line is located at Colgate, about 36 miles from Marysville, Cal., the river being at this point about 600 feet above sea level. A dam across the Yuba River forms a reservoir from which water is conveyed by a flume $7\frac{1}{2}$ miles long to a penstock about 1,700 feet away from and 715 feet above the power house. From this penstock four lines of 30-inch pipe lead down to a receiver pipe laid parallel to and back of the long, narrow power house. From the receiver pipe the water, under a pressure of 300 pounds per square inch, is led to tangential water-wheels through 14-inch pipes. Each water-wheel drives a generator mounted on the same shaft. There are two 2,000-kilowatt, three 900-kilowatt, and one 720-kilowatt generators. They are three-phase, 60-cycle, 2,400-volt induction machines. To raise the voltage to the intensity required there are 22 transformers. The transmission line from Colgate to Oakland, as before stated, is 142 miles long. In October, 1901, the line voltage was 40,000, but it was intended to increase this to 60,000 volts. Step-down transformers are used at Woodland, Wheatland, Napa, Oakland, and at the substations on both sides of Carquinez Straits, which deliver currents at the various voltages required at the places mentioned. At Oakland the current is transformed to 2,000 volts, which current operates three synchronous motors direct-connected to 550-volt direct-current generators of 450 kilowatts each. This current is used on the lines of the Oakland Transit Company, which owns all the street car lines of Oakland, Alameda, and Berkeley, with a total extent of 126 miles. A branch line carries power to the Oakland central station of the Standard Electric Company, with the radiating lines already noted. The transmission line is in duplicate; that is, there are two transmission lines, one of which is always in readiness to replace the other in case of accident. These two lines run parallel to each other about 25 feet apart. Each line

consists of Oregon red cedar poles spaced generally 132 feet apart and carrying cross arms arranged to place the three wires at the apices of an equilateral triangle. The wire used in one line is No. 00 medium hand-drawn copper; in the other lines the wire is aluminum from Colgate to Suisun, and of copper for the remaining distance.

At certain points on the line the standard rule construction is varied to meet the conditions introduced by the necessity of crossing intervening bodies of water. The most notable of these special crossings is that of the Straits of Carquinez. Here steel framework towers were erected on the banks of the stream, over which cables were stretched so as to swing 200 feet above the water at their lowest points. The distance between the towers was 4,427 feet, and it was necessary for this great span to substitute a stronger cable than one of copper or aluminum. Accordingly a cable seven-eighths inch in diameter, composed of 19 wires of plow steel and having a breaking strength of 96,000 pounds, was substituted for each of the standard cables used on other parts of the lines. It is worth while to note that this is probably the longest span of wire cable ever erected, and that the means devised to render it safe and stable established several precedents in the design of such spans.

ELECTROLYSIS OF GAS AND WATER PIPES. The decomposition of iron and lead pipes by means of stray electric currents is giving rise to an increasing amount of damage to the pipes and of litigation between water and gas interests on the one hand, and the electric railway companies on the other. Damage is reported from London, England, and from Hamburg, Germany, as well as from all parts of the United States. A number of damage and injunction suits against street railway companies were brought in 1901, or continued from earlier years, but no decisions have been rendered by the highest court. In the famous Peoria (Ill.) case a special master in chancery, after an investigation covering three years, recommended that the United States Circuit Court grant an injunction in favor of the

Peoria Water Company against the railway companies of that city. Although the report was filed during the first half of 1901, no decision in the case was handed down during the year. A lower court, at Indianapolis, Ind., rendered a preliminary decision in favor of the Manufacturers' Natural Gas Company against the Indianapolis Street Railway Company. The court, in overruling a demurrer to the suit, strongly upheld the right of the gas company to seek redress for its injuries to its mains when well-known remedies were available. At Pittsburg, Pa., the proprietor of a hotel sued an electric company for damages alleged to have been caused by the failure of the lead water service pipe which supplied the hotel with water. The hotel keeper claimed that the pipe was eaten away by the electric current.

ENGLAND. See **GREAT BRITAIN.**

ENGLAND, CHURCH OF, the "established" church "in its recognition as the national organization for the maintenance of Christian belief and practice." It is divided into two provinces, Canterbury and York, in each of which there are houses of convocation and houses of laymen, the former controlling doctrinal matters, subject, in some instances, to the sanction of Parliament, and the latter convening to discuss current church questions, but excluding matters of doctrine. There are about 1,400 parishes, in which are 6,030,800 (estimated) church sittings, and a clerical force represented by 2 archbishops, presiding over the provinces of Canterbury and York, 63 bishops, including 22 suffragan and 8 assistant bishops, and 23,000 clergy (beneficed, and curates, and unbeneficed). The colonial and missionary bishoprics number 90, with nearly 4,000 clergy. Rarely in any one year has the church suffered greater loss by deaths in the episcopacy than during 1901. Dr. Mandell Creighton, bishop of London; Dr. William Stubbs, bishop of Oxford, and Dr. Brooke Foss Westcott, bishop of Durham (*q.v.*), were men of great influence, not only in the church, but were distinguished also in various lines of sectarian activity, and especially in the realm of literature. The forty-first annual church congress, at Brighton, was devoted to discussions on subjects of current importance and interest to the church, and included such topics as *Education, The Empire and Church Work, Authority, The Reformation Settlement, The Work of the Church in the Army, Sunday Observance, The Overcrowding Question*, and meetings on church work in charitable and reformatory institutions, and on temperance, religious duties, etc. The meeting of 1902 will convene at Northampton.

ENTERIC FEVER. See **TYPHOID FEVER.**

ENTOMOLOGY. The year 1901 was not especially notable in the study of insects, but some important discoveries were made, and much valuable literature appeared. Perhaps the most interesting work was done along the line of the relationship of insects and disease, especially in the study of the life histories of mosquitoes. In various parts of the world careful investigations have been made upon the habits of mosquitoes, with a view to exterminating them, and cleaning up their breeding places. In Freetown and Lagos, on the West Coast of Africa, Major Ronald Ross, under the auspices of the Liverpool School of Tropical Medicine, has been carrying on some work, and early in September, 1901, he reported that the number of mosquitoes in Freetown had been greatly reduced, some places which formerly swarmed with them being almost entirely free. Empty tin cans, buckets, and broken bottles were gathered, pools and puddles in streets and backyards were drained, and in a few weeks mosquitoes were rarities. In America, New Jersey has been the scene of extensive and important studies, which have resulted in throwing much light on the mosquito problem in that State. The most abundant species was found to be *Culex sollicitans*, which was found breeding not only in brackish and salt water, but in water that was 25 per cent. more salty than ordinary sea-water. It does not breed in fresh water at all. Another fact brought out was that adult mosquitoes may be found at great distances from their breeding places, so that *Culex sollicitans* occurs from twenty to forty miles from salt water, often in great abundance. Mosquitoes also occur from five to fifteen miles off shore, over the open ocean, and there is every reason to believe that the distribution of adults is largely determined by the wind. The second most abundant mosquito, *C. pungens*, was found breeding in almost every sort of place where the water was not salt. It breeds late in the fall, and the adults hibernate. Most important of all the observations, however, are those on *Anopheles*,

the malaria-bearing genus of mosquito. Though these mosquitoes are very abundant and hardy, there is no relation between their numbers and the prevalence of malaria. They occurred in great abundance in some places where malaria is practically unknown. It was shown, beyond question, that cold, and even the formation of ice over them, is not injurious to the larvæ and pupæ of this genus. Observations have recently shown that gold fish may be used as an agent for the destruction of mosquito larvæ, as they eat them eagerly. Some small ponds are kept comparatively free from mosquitoes owing to the presence of these fish. As gold fish are quite hardy, the introduction of them into small mosquito-breeding ponds is well worth while.

In economical entomology, next to the mosquito as a pest, must be ranked the so-called "San José scale," which spread with alarming rapidity during 1901, and is now recognized as a scourge in thirty-five States and Territories of the Union, as well as in Canada. Even as far east as Massachusetts, the control of the pest has become a serious problem. Special efforts have been directed towards determining its natural enemies, and spreading them wherever the scale goes. The original home of the San José scale has long been in doubt, but in November, 1901, it was announced that C. L. Marlatt, of the Department of Agriculture, had discovered the long-sought-for home of the insect in China, in the region south of the Great Wall. He found that it is there preyed upon by a species of lady-bird beetle, and living specimens of the latter were sent to the United States. Investigations in Japan have shown that the scale is widely distributed over the whole empire (except Shikoku), but in most places it is effectively kept in check by a chalcid fly and a lady-bird beetle. It is also important to note that in Japan the scale has been found only on cultivated trees (except close by orchards), which would seem to indicate its being an introduced pest there, probably from China. In the United States more than a dozen legislatures have passed laws intended to reduce the danger from the scale to a minimum, and the Department of Agriculture is engaged in efforts for its suppression by natural enemies, as well as by means of insecticides and fumigation and the use of hydrocyanic acid gas. This gas has also been found to be of great value in ridding buildings of insect pests; for experiments conducted in Washington during 1901 show that flies, spiders, centipedes, cock-roaches, and even mice, are effectively destroyed by one-tenth of a gram of pure cyanide of potassium per cubic foot of space. The gas, which is generated by dropping the cyanide into sulphuric acid, should remain in rooms at least three hours. As hydrocyanic acid in all forms is one of the most violent poisons known, it should only be used with the greatest care, and never by inexperienced persons. Food will probably absorb the gas, and it cannot be used, therefore, where foods are stored, and as it is very inflammable, all fires should be extinguished during its use. Therefore, although it is very effective, its use is attended with much inconvenience and no little danger.

A very interesting discovery made during the summer of 1901 is that the odor of squash bugs (*Anasa*) when very strong is fatal to salamanders, toads, and frogs. Snakes are apparently not affected by it. The odor is given off from a clear, greenish liquid expelled from the anus of the bug. It was shown, in the experiments conducted at the New Hampshire Experiment Station, that the odor from seven bugs was sufficient to stupefy and ultimately kill a half-grown toad. The effect seems to be something like that of chloroform, death resulting only after some hours.

Literature.—The amount of entomological literature published during 1901 was very considerable, and of course only a few of the most important works can be cited here. There were two additions to periodical literature, both bi-monthlies; one, the *Revue Russe d'Entomologie*, devoted especially to the Russian insect fauna; the other, the *Zeitschrift für Systematische Hymenopterologie und Dipterologie*, devoted, as its title indicates, to the study of ants, bees, wasps, flies, etc., especially with reference to their classification and the description of new species. At the opposite extreme from these may be mentioned the numerous popular journals and magazine articles intended to spread a knowledge of insects among the reading public. While many such articles are by competent writers and admirably adapted to their purpose, there were some papers published in leading magazines during 1901 which were crowded with errors and misstatements. Of one such it was well said that "the amount of misinformation it conveys cannot be equalled by any bit of newspaper writing, and for ignorance on the part of the writer, it is certainly entitled to the palm." And the worst of it is, we are told that this paper is "part of a book not meant to be scientific, entomologic, or any other 'ologic, but simply to set down things seen and heard and done." Certainly intelligent readers should be very careful that the books and papers from which they get their information are vouched for by competent scientific authorities.

Of books there are several which demand special mention. One of the most important works on butterflies and moths that has appeared in recent years is Staudinger and Rebel's *Catalog der Lepidopteren des Palaarctischen Faunengebietes*, a volume of nearly 800 pages, including all the known species of Lepidoptera

occurring in Europe, the Nile delta, western and northern Asia, and north Japan, in all nearly 10,000 species. When the work of which this is virtually a third edition first appeared just forty years ago, it included 5,250 species, only a little more than half of the number now given. Another work on Lepidoptera, of possibly even greater importance, is the three volumes upon the *Lepidoptera-Rhopalocera* in Godman and Salvin's *Biologia Centrali-Americana*, the publication of which began in 1879, and is only now completed. There are over 1,300 pages of text and 113 hand-colored plates, the latter illustrating about 1,250 of the more than 1,800 butterflies enumerated. A well-known scientist says of these volumes: "It is no exaggeration to say that it is one of the most perfect examples of careful monographic work which has ever appeared in the English language." A popular work on bees recently published is most noteworthy because its author is the well-known writer, Maurice Maeterlinck. It is translated by Alfred Sutro, and is called *The Life of the Bee*. M. Maeterlinck is a practical bee-keeper and his book is accurate and reliable as to its facts; but the style is meditative, speculative, and rather gloomily philosophical. Of American books there are two which demand special mention, both by Dr. L. O. Howard, the government entomologist. One is called *Mosquitoes: How they live; how they carry disease; how they are classified; how they may be destroyed*. It is exhaustive, interesting, and accurate, and will long be the standard work on this subject. Dr. Howard's other book is called *The Insect Book*, and its contents are clearly shown by the sub-title: "A Popular Account of the Bees, Wasps, Ants, Grasshoppers, Flies, and other North American Insects, exclusive of the Butterflies, Moths, and Beetles, with full Life-Histories, Tables, and Bibliographies." It is a volume of over 450 pages, profusely illustrated with 47 plates and 264 wood-cuts, and is invaluable to any one interested in insects.

EPILEPSY is a condition not well understood, in which there is a sudden liberation of nerve energy from the brain, due to loss of the usual control or the usual harmonious action of the nerve centres in the cerebral cortex. Four varieties of epileptic attacks are described by neurologists. Attacks which resemble these in some respects, but which are due to toxins, fatigue, etc., are called epileptiform attacks. The most frequent variety of epileptic attack consists of a convulsion, or fit, during which consciousness is lost, the patient falls, a part or the whole of the body twitches and is contorted, the patient froths at the mouth, bites his tongue or cheek, and his face becomes bluish or purplish. Before the attack he is usually irritable, morose, and depressed, and has a voracious appetite. After the convulsion ceases, he usually sleeps for a quarter or half hour, awaking languid and tired, with tenderness in the muscles, as if they had been bruised. This variety of attack is called *grand mal*. The second variety consists of a loss of consciousness lasting 4 or 5 seconds, in which the patient does not fall or become convulsed, but remains rigid, suspending whatever occupation he may be engaged in, looks fixedly before him without winking, then draws a deep inspiration, relaxes, and returns to consciousness. This form is called *petit mal*. The third variety of epilepsy is called psychic epilepsy. In this form, after the usual despondency, irritability, restlessness, dread, giddiness, or, in some patients, elation, in others a voracious appetite, instead of a fit the patient experiences a sudden attack of laughing, weeping, or shouting, with extravagant gestures, and even, in some examples, with uncontrollable homicidal impulse devoid of motive. On returning to consciousness the patient is entirely ignorant of what he has done during this period, which may resemble mania. The fourth variety of epileptic attack is called Jacksonian epilepsy. In this variety there is a convulsion limited to a part of the body, as to an arm or a leg, without loss of consciousness. Jacksonian epilepsy is usually a symptom of brain tumor. Before, as well as after, an ordinary convulsion of the first or second variety, there is, in some cases, a psychical manifestation, consisting of an attack upon some one, a theft, or a destructive act. Such a manifestation is purely automatic and irresponsible, for the patient is already unconscious. A leading idea, delusional or otherwise, prevailing in the patient's mind, such as a grudge or resentment, may become operative in the post-paroxysmal stage; and the patient may perform complex acts, automatically, that have every appearance of being volitional. The assault on the German emperor in March, 1901, was probably made by an epileptic. The man had several fits after throwing a piece of iron at his majesty and wounding his cheek; and it is possible that he was unconscious and acting automatically, in a pre-paroxysmal psychical stage, without volition or responsibility.

EPILEPTIC COLONIES. The State Board of Charities of Illinois conditionally accepted, in 1901, a parcel of ground at Northcliff, Jersey County, Ill., as the future location of an epileptic colony. It was reported by the governor during the previous year that there were more than 5,000 epileptic inmates of various charitable institutions in the State, awaiting transfer to the projected colony. In March, 1901, the house of representatives of Indiana passed a bill providing for a colony for the epileptics of that State. Not less than 1,000 acres of land are to be acquired for

this purpose, and \$40,000 is to be appropriated for the purchase of the land, as well as \$160,000 for the projected buildings. The site has not yet been selected.

The first epileptic colony in the United States, and an ideal and model in all respects, Craig Colony, at Sonyea, N. Y., is preeminent. It occupies a tract of over 1,000 acres in the fertile Genesee Valley, near Mt. Morris, well watered and largely under cultivation. The tract was purchased from a decreasing Shaker community in 1894, with many buildings in good condition and several well-built roads and railway connections. The grounds are divided by the Kishaqua creek, which allows complete separation of the sexes. On the creek is a grist mill and a sawmill. Brick clay beds and limestone deposits exist on the property. The colony was opened for the reception of patients in January, 1896, and the sixth fiscal year ended September 30, 1901. During these years schools have been maintained for English branches and for manual training, workshops for the manufacture of brushes, mats, shoes, clothes, and bricks have been in operation, and printing, blacksmithing, painting, dressmaking, and tailoring have been carried on by patients, besides raising of live stock and farming. On September 30, 1900, there were in the colony 612 patients, 329 males and 283 females. During the year 1900-01, 259 were received, 198 males and 61 females; 80 were discharged, 36 died, and 12 were transferred-as insane to State hospitals, leaving the numbers on September 30, 1901, as follows: 440 males and 303 females, making a total of 743. The average daily attendance was 676.41. The annual per capita cost decreased from \$300.02 in 1897-98 to \$164.42 in 1900-01. Of the 1,104 patients received into the colony since its inception, 16 per cent. had epileptic ancestors, 15 per cent. had alcoholic ancestors, 14 per cent. tubercular ancestors, and 8 per cent. insane ancestors. The number of recovered or improved patients among those discharged in 1900-01 is not stated in the annual report.

EPWORTH LEAGUE, the result of a union of several societies, was formed in the Methodist Episcopal Church in 1889. Its objects are the promotion of spiritual development among young people, and embrace features for social and intellectual as well as for religious advancement. The league now has a total membership of 1,900,000 enrolled in 21,000 regular and 7,600 junior chapters. The *The Epworth Herald* is the official organ of the society. A successful international convention was held July 18-21, 1901, in San Francisco. President, Bishop T. W. Joyce, D.D.; secretary, Rev. J. F. Berry, D.D.; treasurer, R. S. Copeland, M.D.; central office, 57 Washington Street, Chicago, Ill.

EPWORTH LEAGUE OF THE M. E. CHURCH, SOUTH, since its organization in 1891, has gained 306,580 adherents, included in 5,838 chapters. The activities of the league are developed along lines similar to those of the northern-body. The *Epworth Era* is a representative periodical. President, Bishop W. A. Candler; secretary, Rev. H. M. Du Bose, D.D., Nashville, Tenn.; treasurer, O. W. Patton.

ERITREA or ERYTHREA, an Italian colony on the western coast of the Red Sea, extends from Cape Kasar, the eastern limit of the Egyptian Soudan, for some 670 miles, to French Somaliland, at the Strait of Bab-el-Mandeb. The estimated area is 88,500 square miles, and the population, which is largely nomadic, is placed at 450,000. The residence of the Italian civil governor is at Massawah, the chief town and port (population about 7,800). Thus far the colony has been no small burden to Italy. For the fiscal year 1899 the revenue and expenditure were estimated at 2,491,600 lire and 10,622,400 lire respectively, and for 1900 at 2,456,700 lire and 10,587,500 lire respectively, the deficits being made up by the Italian government. The lire is worth 19.3 cents. The rearing of cattle and other live-stock is the most important industry. The imports at Massawah in 1899 were valued at 9,071,391 lire and the exports 1,628,154 lire. A military railway from Massawah to Saati, 17 miles distant, is being extended to Asmara. Massawah is connected by telegraph with Assab, 319 miles, and Assab with Perim, 62 miles. A telegraph line has been projected to connect Massawah with Adis Ababa, in Abyssinia. Pursuant to the Franco-Italian protocol signed in January, 1900, the boundary between Eritrea and French Somaliland was delimited in March, 1901. Assab, which is of some importance as a caravan terminal, was assigned to Eritrea. An agreement defining the boundary with the Egyptian Soudan was signed in April, 1901.

EROS. See ASTRONOMICAL PROGRESS.

ERRAZURIZ, FEDERICO, president of Chile, died July 12, 1901. He was born at Santiago, Chile, September 16, 1850, the son of a former president of Chile, and was admitted to the bar as a lawyer in 1876. Elected first to the Chilean congress in the same year, Señor Errázuriz held his seat until 1889, when he was elected to

the senate. During the administration of President Balmaceda he held the portfolio of war, and under President Montt that of justice and public instruction. As the candidate of the Liberal-Conservatives he was elected president in 1896, which position, on account of ill health, he resigned shortly before his death. Well fitted by nature and education for executive leadership, President Errázuriz met with great credit to Chile and himself the numerous international and economic problems that confronted his administration.

ESCHENHAGEN, Max, physicist and from 1899 director of the Royal Prussian Magnetic Observatory, died November 12, 1901. Besides designing improved magnetic instruments, several of which are used in the international magnetic surveys now in progress, he prepared the plans for the magnetic observations to be made on German Antarctic expeditions, and arranged for simultaneous observations to be carried on at different stations throughout the world during the explorations. He was the author of many papers on terrestrial magnetism and allied subjects.

EUPHRATES VALLEY RAILWAY. See **TURKEY** (paragraphs on History).

EVANGELICAL ASSOCIATION, founded in 1800, also known popularly as the German Methodist Church from points of similarity in polity and mode of worship, now has 27 conferences, in the United States, Canada, Germany, Switzerland, and Japan, which include 119,936 members. There are 1,836 churches, with property valued at \$6,126,430, and 1,083 itinerant and 476 local preachers, while the Sunday schools number 2,186 with nearly 25,000 officers and teachers, and are attended by some 150,000 scholars. Collections for the year aggregated \$1,094,562, of which \$147,081 was received for missionary enterprises. These statistics indicate a uniform progress in the year 1901. The church has a flourishing Young People's Alliance, which includes 33,626 adherents in its 1,119 branches. It maintains a publishing house in Cleveland, O., the periodical literature of which both in the English and German languages, is extensive. The *Evangelical Messenger* is a representative denominational paper. The general conference of the church, which has convened regularly in quadrennial sessions since 1843, next meets in 1903; the individual conferences hold annual meetings. See **UNITED EVANGELICAL CHURCH**.

EVARTS, WILLIAM MAXWELL, American lawyer and statesman, died in New York City, February 28, 1901. He was born in Boston, Mass., February 6, 1818, and graduated at Yale in the class of 1837. While in college he founded and edited the *Yale Literary Magazine*, and was one of the three "high oration" men of his class. In 1838-39 he studied in the Harvard Law School, and then went to New York City, where he entered the office of Daniel Lord, and was admitted to the bar in 1841. From the beginning of his legal career, Mr. Evarts attracted attention by the soundness of his learning and his comprehensive grasp of the larger aspects of the law. Though never a politician, he was early in his experience (1849) made assistant United States district attorney at New York, and two years later, at the age of 33, promoted to district attorney, serving until 1853. Among the important cases which he had to deal with while in this position was the prosecution of the leaders in the *Cleopatra* filibustering expedition to Cuba, a matter involving many principles of international law and relationship. Another concerned the right of southern slave-owners to take slaves in transit through New York, the decision of which denied that right. He headed the New York delegation to the Republican convention at Chicago in 1860, and in a notable speech nominated his intimate associate, William H. Seward, for President, but finally had the honor of moving the unanimous nomination of Abraham Lincoln. His greatest legal triumph was the defense of President Andrew Johnson in the great impeachment trial in 1868, when, as senior counsel, he was successful in turning the almost unanimous sentiment of the Senate for conviction to a doubt strong enough to dismiss the charge by a majority of one vote. In this case Mr. Evarts' argument was on the broad ground that to punish merely unbecoming and vexatious behavior (of which President Johnson stood convicted) with dismissal from office, would destroy that calm, judicial spirit and that forbearance in critical emergencies that are essential to the carrying out of a system of popular government. This was typical of his view of the law. In July, 1868, he was made attorney-general in Johnson's cabinet, and held that portfolio until March of the following year. In 1871 he appeared before the Geneva tribunal as counsel for the United States in the famous Alabama claims case, when England was directed to pay the United States \$15,500,000 for depredations committed during the Civil War by Confederate cruisers built in England. His place as the foremost international lawyer of America was fixed by this success as firmly as his primacy as a constitutional lawyer had been established by his conduct of the Johnson impeachment. Another notable legal battle in which he was engaged was the case of Theodore Tilton against Henry Ward Beecher, in which he defended Beecher (1874). The Hayes-Tilden contest of 1876, when the returns of Hayes presidential

electors from Louisiana were bitterly contested by the Democrats in Congress, on the ground that intimidation and force had contributed to the result, afforded Mr. Evarts another opportunity to show his firm grasp of constitutional law. As the basis of his argument in support of Hayes, Mr. Evarts showed that the Federal government could go behind the State returns only at the gravest risk of impairing that State's sovereignty. This argument was recognized as sound, the Louisiana returns were admitted, Hayes was elected President, and Mr. Evarts was made secretary of state in 1877. He filled this office with dignity and brilliancy, and with the sound judgment which always characterized his official acts. One of his notable works was the report he made in 1880 on the subject of the American control of any trans-Isthmian canal that might be built, whether at Panama or at Nicaragua, and it was upon his advice that President Hayes took the view of the necessity for exclusive American control of such a canal. Mr. Evarts retired from the state department in 1881, and four years later he was elected to the Senate, retiring at the end of his term in 1891. With his retirement from public life, Mr. Evarts practically gave up active work, and his appearances in the courts were very infrequent. He was a graceful and powerful orator, especially famous as an after-dinner speaker, and his addresses were numerous, including the famous eulogy of Chief Justice Chase in 1873, the centennial oration at Philadelphia in 1876, and the speech at the Bartholdi monument unveiling in New York City, 1883.

EYRE, EDWARD JOHN, ex-governor of Jamaica, died at Tavistock, England, November 30, 1901. He was born in Yorkshire, August 5, 1815, and was educated at the Sedburgh Grammar School. In 1833 he went to Australia and engaged in sheep and cattle raising. Later he devoted a large part of his time to exploration, the result of which he published in 1845 in *Discoveries in Central Australia*. In 1846, soon after his return to England, he was appointed lieutenant-governor of New Zealand, and in 1854 was sent in the same capacity to the West Indian island of St. Vincent, being transferred in 1859 to Antigua as acting governor of the Leeward Islands. In 1864 he was made governor-in-chief of Jamaica, and his drastic measures in stamping out a rebellion of the natives resulted in an active prosecution by a "Jamaica Committee," headed by John Stuart Mill. Notable as a defender of Governor Eyre's acts was Carlyle, and after a long succession of trials the controversy was dropped and Governor Eyre retired to private life.

FABER, BARON JOHANN LOTHAR VON, German manufacturer, died at Nuremberg, January 15, 1901. He was born at Stein, June 12, 1817, and in 1839 assumed direction of the lead-pencil factory founded at Stein by his great-grandfather in 1760. At that time only 20 workmen were employed, but the new director abolished the antiquated methods then employed and effected such improvements that, instead of suffering from competition by foreigners, the factory increased its producing capacity until Germany depended upon its output. Branches were established in New York, Paris, Berlin, and London, and agencies in many other cities. Later, copying pencils were produced, and all sorts of artists' materials, and, beginning with 1856, specially prepared slates and slate-pencils, by means of a contract with the owners of newly discovered graphite in Siberia. At Noisy-le-Sec, near Paris, there is a community of 1,100 employees of the factory for artists' materials, for whom Baron Faber established savings banks, dwellings, schools and churches, and institutions for instruction in drawing. He was made a baron in 1881.

FALKLAND ISLANDS, the largest group in the south Atlantic, lying 300 miles east of the Straits of Magellan, constitute a British crown colony. South Georgia, an uninhabited island about 1,000 miles to the southeast, is included in its jurisdiction. The Falkland group consist of East Falkland, area 3,000 square miles; West Falkland, area 2,300 square miles, and upward of 100 smaller islands, the area of the whole being about 6,500 square miles, and the population, in 1901, 2,043. South Georgia has an area estimated at 1,000 square miles. The capital and chief town is Port Stanley, which is located on East Falkland, and has a population of 789. The revenue in 1900 was £15,576 and the expenditure £15,502. The imports in the same year were £66,948 and the exports £111,539, wool being the largest item

and amounting to £95,833. The trade is almost entirely with Great Britain. Sheep-farming is the chief industry, there being 2,325,154 acres of pasturage and 779,900 sheep (1900).

FEDERATED MALAY STATES, occupying a part of the southern Malay Peninsula, are under British protection and administered under the advice of a British resident-general. The federation comprises Perak, Selangor, Pehang, and Negri Sembilan, the latter itself a confederation of nine small island states. The combined area is about 25,100 square miles. The population has increased from 418,509 in 1891 to 676,138 in 1901. The government in each state is in charge of a sultan, advised by a British resident. There is a British resident-general for the whole federation, subject to instructions from the high commissioner, who is the governor-general of the Straits Settlements (*q.v.*).

Since the Federated States were brought under British protection in 1874, the revenue has increased from about 1,000,000 dollars (the dollar is worth about 50 cents) in that year to over 15,500,000 dollars in 1900; the latter figure exceeded the revenue for 1899 by over 2,000,000 dollars, and was nearly 3,000,000 dollars greater than the year's expenditure. The largest source of revenue is the export duty on tin, which in 1900 amounted to 7,000,000 dollars.

The foreign trade in 1900 amounted to about 10,000,000 dollars more than the trade of 1899, being nearly 100,000,000 dollars, of which about 60 per cent. represented exports. Unlike the Straits Settlements proper, the Federated States have no transit trade, and the figures here stated represent the real produce of the country and the amount of goods bought for local consumption. The chief product is tin, Perak and Selangor exporting a greater part of the Straits Settlements' production. There are extensive coffee plantations, which have recently become very profitable, and rice, sugar, pepper, and spices are also raised for export.

Since the Federated States have been under British protection over 250 miles of railway, 1,300 miles of cart road, 1,400 miles of telegraph line, and numerous public buildings and works have been constructed. In 1901 there were over 100 miles of railway under construction. In 1900 the government of Perak was engaged in effecting the irrigation of some 60,000 acres of land at a cost of about 1,000,000 dollars.

FEDERATION OF LABOR, AMERICAN. President, Samuel Gompers; secretary, Frank Morrison, Washington, D. C. The federation was organized in 1881 and had a membership in 1901 estimated at 1,254,000. During 1901 the membership increased by 364,410. The federation now embraces 87 national and international unions, 327 city central labor unions, 20 State federations of labor, 399 federated labor unions, and 750 local unions. The report of the secretary showed a total of 1,056 strikes of all kinds reported. By these strikes, 153,505 workmen benefited, and 12,707 were not benefited. The total cost of the strikes reported was \$548,003. The report of the treasurer showed total receipts of \$126,522; expenditures, \$118,708; on hand, \$8,814. The report of President Gompers noted the growing tendency to agreement in industry, denounced the employment of children, argued for a larger measure of organization among women wage-earners, and recommended a change in the constitution to permit a larger assessment, with a levy by the executive council early in the year of a portion of the assessment provided, "so that a fund may be at its disposition at any time in the interests of any of the affiliated organizations engaged in a protracted struggle which they could not singly support." The leading practical question before the federation was, as always, that of trade autonomy. It was urged by the brewers and the United Mine Workers that all trades in one industrial establishment should form one organization for the better advancement of the condition of all. The United Mine Workers contended, for example, that if a comparatively small number of engineers or firemen employed in the mines should strike, as actually happened in the anthracite region in 1900, it would cause all mines affected to be closed and would throw out of work large numbers of men who had no grievance. They argued, therefore, that all trades in the mine should be united under one head in order to avoid the possibility of such friction of interests. The special committee on trade autonomy recommended that when there are only a few craftsmen in a large concern, the best interests of all would be served by the few joining the paramount organization in such establishments, and the amalgamation of subdivided crafts into district and national trade councils, where all disputes should be settled. On the other hand, the executive council decided against the brewery workers in their attempt to force the engineers, firemen, and coopers into their union, and this was regarded as a victory for trade

autonomy. The federation decided to increase the per capita tax of the national and international unions from 1-3 to $\frac{1}{2}$ of 1 per cent. on monthly wages, and to raise the per capita tax of federal and local unions from 5 to 10 cents a month for each member, the increase of 5 cents to go toward the raising of a defense fund.

Considerable acrimony was developed in the debate on a proposition to increase the number of vice-presidents from 6 to 8. It was charged that the executive council already exercised an undue measure of control over the federation, and that this proposal was for the purpose of increasing a power which was already too great. The resolution was voted down, along with a proposition to increase the salaries of the president and secretary. The federation again put itself on record as opposed to any official endorsement of Socialism in the following, which is part of a resolution on the subject: "We declare that since the inception of our movement, inquiry into the best form of government has been its guiding star, and will so continue while there is a high moral desire to gratify or an injustice to correct. Our meetings, local and national, are now, and always have been, free to the discussion of any legitimate economic or political question; but, on the other hand, are as equally pronounced against parties and politics, religious discussions, or race prejudices, and as success has followed these meritorious conclusions, we would be unfaithful to the duty we owe mankind to do other than strongly recommend a continuance of the methods, the inculcation of which means the greatest amount of safety to our movement with the least degree of danger." Important resolutions rejected were: (1) Opposing ticket scalping; (2) providing for a universal label; (3) organizing female core-makers employed in foundries; (4) instructing union members to hold aloof from State militia (tabled); (5) protesting against the making of cigars by machinery. Important resolutions adopted were: (1) In favor of a Chinese exclusion law; (2) recommending that organizers make an effort to organize school teachers; (3) that legislatures be petitioned to enact a law to compel the construction of machinery to cover all dangerous parts in such a way as to protect employees working around machinery; (4) that no boycotts be declared until the central labor unions have endeavored to effect an amicable settlement; (5) that government officials should enforce the child labor eight-hour law on all government work in private shipyards; (6) petitioning Congress to amend the marine laws so that every seaman shall have the right to quit any merchant vessel which has become obnoxious to him, and also to prohibit the towing on the ocean of gigantic rafts; (7) authorizing the federation to send representatives to conventions of national and international organizations, particularly those of railway employees; (8) instructing the executive council to make effort to secure the passage of a law protecting and legalizing union labels.

FEE, JOHN G., abolitionist and founder of Berea (Ky.) College, died at Berea, January 11, 1901. He was born in Bracken County, Ky., September 9, 1816, and studied at Augusta College, Miami University, and Lane Theological Seminary. Although born in a slave State and the son of a slave-holder, he early inveighed against slavery, and in consequence was disowned by his family and expelled from his church. His crusade was attended by great physical danger from mobs. He removed to Berea in 1853 and established a church on ground purchased by his friend, General Cassius M. Clay, and therein continued, in spite of violent opposition, to preach abolition. In 1855 he founded Berea College for the education of both whites and negroes. It has been successful and now has 700 students.

FELDSPAR. The production of crude feldspar in 1900 was 1,787 short tons, valued at \$7,259, while ground material amounted to 19,566 short tons, valued at \$166,490. Much of the product is ground at the mines. In recent years considerable feldspar of high quality has been imported into the United States from Canada and is used by the Trenton potteries, and also in the manufacture of wood filler, scouring soap, and glass.

FENCING. The sport of fencing showed little change in popular interest during 1901. The eighth annual intercollegiate championships were held at New York on April 6, and were won by the United States Naval Academy in a contest with Cornell. Columbia was third, with 5 bouts less than Cornell. The surprise of the tournament was the defeat of Harvard, the winner of the previous year. Yale was entered, but withdrew at the last moment. In the struggle between Annapolis and Cornell the decision was rendered only after several extra bouts. Scores: Annapolis, 18; Cornell, 17; Columbia, 12; Harvard, 5. Individual: Henry, Annapolis, 8 won, 1 lost; second, Clark, of Columbia, and McBride, of Annapolis, 7 won by each.

The national championships of the Amateur Fencers' League of America were held at New York, April 26-27. The team championship was won by the Fencers' Club of New York, 6 bouts; New York Athletic Club, 3 bouts. The individual championships: Foils: Charles Tatham, Fencers' Club, 16; Charles Bothner, New York Turn Verein, 11; Fitzhugh Townsend, Fencers' Club, 10. Sabres: A. V. Z. Post, Fencers' Club, 20 points; F. L. Slazenger, New York Athletic Club, 18½;

J. L. Irving, 17. Duelling swords: Charles Tatham, 14 bouts; Charles Bothner, 12; A. De Diaz, 10. Single sticks: F. L. Slazenger, 21; John Allan, 19; J. L. Irving, 14. The junior team championships, New York, March 9, were won by Annapolis; second, Columbia; third, New York Turn Verein. At the sixth annual contest of juniors for the Morris medal there were representatives from the New York Fencers' Club, Columbia, Yale, Cornell, New York Athletic Club, and New York Turn Verein. The Fencers' Club won, 57; New York Athletic Club, 4.

FERNANDO PO, an island lying off the coast of Cameroon, belonging to Spain, has an area of about 780 square miles and a population of some 25,000. The German press, in July, 1901, reported that Germany had acquired the right of preemption of the island. Germany already had the right to establish a coaling station on Fernando Po, and a small concession in James Bay. The value of the island consists in its cacao and coffee plantations, which in 1901 numbered about 140 and were controlled by half-breeds, Spaniards, Englishmen, and a few Germans. Trade has been carried on almost exclusively by Spaniards and Englishmen.

FERTILIZATION, ARTIFICIAL. See BIOLOGY and PHYSIOLOGY, CHEMICAL.

FIJI is a crown colony of Great Britain situated in the southern Pacific Ocean, 1,100 miles north of New Zealand. The islands are about 225 in number, of which about 80 are inhabited. They extend 300 miles east and west, and an equal distance north and south. The area of the colony, including Rotumah, is 8,045 square miles. The two largest islands are Viti Levu (Great Fiji) and Vanua Levu (Great Land), having areas of 4,112 and 2,432 square miles respectively. The capital is Suva, a port of Viti Levu. The population, March 31, 1900, was 117,870, of whom 2,447 were Europeans, the remainder being for the most part native Fijis and Indian immigrants. The colony is administered by a governor appointed by the crown and assisted by a council of three members. There is a legislative council composed of six official and six unofficial members, nominated by the crown, of which the governor is president. Native chiefs administer tribal or communal government, under the governor's supervision. There is no military establishment except a battalion of European volunteers, raised in 1899, and an armed native constabulary. The public income for 1900 was £111,569, the expenditures £102,022, and the public debt is £200,536, about half of it bearing interest. The chief products, from about 50,000 acres of land under cultivation, are bread fruit, bananas, plantains, peanuts, yams, coconuts, sugar cane, tea, cotton, maize, tobacco, and arrowroot. Sugar, distilled spirits, and green fruits are exported in considerable quantities. The total exports for 1900 reached a value of £613,808 (an increase of £137,980 over 1899), including sugar, 32,961 tons; copra, 15,605 tons; distilled spirits, 158,224 gallons. The total imports for the same year amounted to £343,864, including £23,358 of live-stock. The increased production of copra in part accounts for the increase of exports. Of the total trade, the port of Suva is credited with £770,266 and Levuka with £109,400. The wharves at Suva, in 1901, were being extended to accommodate the increased traffic of the port.

Education in Fiji is conducted mostly by the religious institutions, the Wesleyans and Roman Catholics predominating. The natives are tractable to European influence and peaceable among themselves. Christianity is making progress in the islands.

FILARIA. The filariæ are a parasitic family of the Nematoda. *Filaria medinensis* ("Guinea worm") is found in different tissues of the bodies of negroes in Guinea, Senegal, Egypt, Arabia, Persia, and India. It is from 1 to 10 feet long and about one-tenth of an inch wide, and causes painful tumors, blisters, or boils, and sometimes gangrene. *Filaria sanguinis hominis*, which is about one seventy-fifth of an inch long, is found in the blood; it is indigenous to Africa, India, China, Australia, and Brazil, and has been found in negroes in our southern States. The parasite is transmitted by mosquitoes. Strong, of the chief surgeon's office, Division of the Philippines, in 1901 found a case of filariasis in Iloilo. The embryos of *filaria nocturna* began to appear in the blood of this patient at 6 P. M., and were numerous at midnight. He believes that it is probable that filariasis will become domesticated in the southern States, through the return of American soldiers. In 1901, Low, of Rome, published studies of the development of *filaria nocturna* in mosquitoes found in St. Lucia, *Culex fatigans* and *Culex terriatus*. From twelve to twenty-four hours after the *Culex terriatus* had fed on a patient suffering from filariasis, Low found active filaria embryos in the thoracic muscles of the mosquito. After developing slowly for from seven to nine days, these embryos degenerated and never reached maturity. In *Culex fatigans* filaria embryos mature rapidly, and the perfect filariæ are found in the head, neck, and proboscis of the mosquito.

FINANCIAL REVIEW OF THE YEAR. *The Stock Market and Current Events.*—The course of prices of 22 leading stocks on the New York Stock Exchanges during 1901 was as follows:

RAILROADS.

INDUSTRIALS.

The movement of averages, as given by the *Wall Street Journal*, is as follows:

12 Industrials.		20 Railways.	
Dec. 27, 1900	71.04	Jan. 12	97.85
Jan. 19, 1901	64.77		93.56
May 1, 1901	75.93		117.86
May 9, 1901	67.38		103.87
May 13, 1901	71.92	May 10	110.06
May 14, 1901	69.50		104.54
June 3, 1901	77.73		115.69
June 8, 1901	76.07	June 11	114.39
June 17, 1901	78.26		117.65
July 15, 1901	69.46		106.35
July 29, 1901	72.94	July 18	111.50
Aug. 6, 1901	69.05	Aug. 5	104.86

12 Industrials.		20 Railways.	
Aug. 26, 1901	73.83	Aug. 5	111.69
Sept. 13, 1901	67.25		105.30
Sept. 20, 1901	70.47	Sept. 21	110.82
Oct. 5, 1901	63.48	Oct. 7	106.20
Oct. 11, 1901	65.91	Oct. 26	110.88
Oct. 28, 1901	64.01		109.60
Nov. 11, 1901	66.52		114.56
Nov. 14, 1901	65.36		112.35
Nov. 22, 1901	65.88		115.21
Dec. 12, 1901	61.61		110.08
Jan. 6, 1902	64.90	Jan. 2	115.85

The movement of stock averages may be generally divided into two periods for the industrials and two for the railroad shares. From January 19, 1901, until the first week in May there was an average advance in railroad shares of 20.01 points. This was followed by a sharp reaction on May 19, and that in turn by a quick recovery to 117.65 on June 17. From June 17 to the end of the year the average remained fairly constant, ranging from a low point of 105.30 on September 13 to a high point of 115.21 on November 22. The movement of industrial shares was generally upwards until June 17, showing an extreme rise from January 19 of 13.49 points. From June 17 the general tendency was downward, the extreme decline on December 12, when the average stood at 61.61, being 17.65. The conclusion from these tables of averages is that during the first five months of the year both railway and industrial shares were in great demand at high and rising values, and that during the last seven months, while railways maintained their position, the prices of industrials fell heavily, and on the whole steadily.

The leading events of financial importance were: (1) The purchase of the Central Railroad of New Jersey for the Reading in January; (2) the formation of the United States Steel Corporation (*q.v.*); (3) the purchase by the Union Pacific of a controlling interest in the Southern Pacific, the two latter transpiring in February; (4) the announcement of the approaching consolidation of the Boston and Butte Copper and Silver Mining Company and the Boston and Montana Consolidated Mining Company with the Amalgamated Copper Company, and the settlement of the difficulties between the last-named company and the American Smelting and Refining Company; (5) the purchase by the Great Northern and Northern Pacific Railway Companies of the stock of the Burlington; (6) the panic of May 9; (7) the strike of the steel workers in July and August; (8) the drought in the Western States in July and August; (9) the reduction of the dividend on Amalgamated Copper on September 20; and (10) the organization of the Northern Securities Company in November.

The tremendous and far-reaching combination of industrial and railway properties during the early months of 1901 converted an upward movement in the stock market, begun immediately after the second election of President McKinley, into the most remarkable speculative boom on record. During April, while the boom was at its height, the total share sales amounted to 41,719,086 shares, the largest previous total being 30,285,055 shares, in January, 1901. On the 30th of April the sales of shares footed up 3,281,286, the largest ever recorded. In addition to the important combinations announced, a number of others were rumored. The phrase "community of interest" was used to explain a totally new situation in the financial world, which would make competition impossible and place corporate earnings on a permanently higher basis. An immense number of people in all parts of the country and in every condition of life invested their accumulations in the purchase of stocks. Under the stimulus of this heavy buying, as may be seen by reference to the preceding table of stock values, some remarkable advances were recorded. From January to May, Atchison gained 48 points, Burlington 59¾, Missouri Pacific 47¾, Amalgamated Copper 41¾, and General Electric 49½. This upward movement culminated on May 9 in the most remarkable panic ever experienced on the New York Stock Exchange. This panic developed out of a contest for the control of the Northern Pacific Railroad between Union Pacific interests on the one side and Mr. James J. Hill and Messrs. J. P. Morgan & Company on the other. When the announcement of the Burlington purchase was made, representatives of the Union Pacific demanded that they be allowed to share in the purchase, on the ground that if the Burlington was in the hands of the Northern transcontinental lines, much traffic which it had formerly given to the Union and the Southern Pacific would be transferred to the Great Northern and the Northern Pacific. This demand of the Union Pacific was refused by Mr. Hill. Mr. E. H. Harriman and Messrs. Kuhn, Loeb & Company, representing the Union Pacific, thereupon proceeded to purchase, both in this country and in Europe, large amounts of both preferred and common

stock of the Northern Pacific Railroad, in order to gain a sufficient influence in that company to prevent it diverting Burlington traffic away from Southern and Union Pacific over its own lines. This attempt succeeded so far as the preferred stock was concerned, an actual majority of this issue passing into the hands of the Union Pacific interests. The contest was then transferred to the common stock of the Northern Pacific, a portion of which was not yet in the hands of the opposing interests, and if secured by the Union Pacific, would give that company control of the Northern Pacific. The price of Northern Pacific common, under the influence of heavy buying, rapidly advanced on May 6 from 114 to 133, on May 7 to 149¾, and on Wednesday, the 8th, to 180. A large number of speculators, in ignorance of the real situation, and knowing that the advance in the stock was not warranted by earnings, sold short to the contending interests for future delivery, expecting to borrow the stock, make their deliveries, and within a short time cover their short sales at a lower price. On Wednesday it developed, however, that there was very little Northern Pacific common stock to be either borrowed or bought, and 80 per cent. had to be paid for its use over night. The following day 300 per cent. was asked for one day's use of the stock, and the price rose to 1,000 for cash sales. At the same time the rates for money rose to prohibitive figures, as much as 75 per cent. being paid. In order to secure funds for the purchase of Northern Pacific, the "shorts" sold heavily of other securities. Large blocks of the very best stocks were pitched overboard. Brokers who were carrying large lines for their customers on margins, in order to save themselves, were obliged to sell. This rush of selling orders carried prices down rapidly. The differences between the high and low points of May prices recorded in the preceding table of quotations shows the extent of the panic. The panic ceased immediately on the afternoon of May 9, when it was announced that all short contracts could be settled by paying the difference between the selling price and 150. A syndicate of bankers and others also offered to loan large sums of money at the market rate. The reaction from the low prices of the early part of the day was immediate, and is illustrated by the following table of high, low, and closing quotations of 8 active stocks on May 9:

	High.	Low.	Closing.
Atchison	78¾	43	66¾
Chicago, Milwaukee & St. Paul.....	165	134	141
Missouri, Kansas & Texas	59	37	48
Pennsylvania	147	137	144
Southern Pacific	49	29	45½
Amalgamated Copper	116	90	106
United States Steel	47	24	40¾
United States Steel, pref.	98	69	89½

The Northern Pacific panic is unique in that it was not, like most catastrophes of this nature, caused by any unsoundness of industrial conditions or by an over-speculation in securities, but was altogether the result of a contest for the control of a particular stock. The losses incurred were enormous. Most of the margin speculators were sold out, and the public was frightened away from the market. The inherent strength of the business situation, however, was so great that the leading financial interests were able to prevent the depression which usually follows a panic, and even to advance prices, which on June 17 were but little below the high figures of May. From that time on, however, the market began to weaken. The steel strike and the prolonged drought in the West during July and August were serious depressing influences. Steel common, which had touched 52¾ in June, during July fell to 37, and only with great difficulty was held at or near 40. Reports of crop damage caused Atchison to fall during July from 89¾ to 67¾; Chicago, Milwaukee & St. Paul from 177¼ to 155½; and Rock Island & Pacific from 158½ to 130. Much of this loss was subsequently regained, but the succession of heavy blows further discouraged speculation and increased the burden of sustaining the market. In September came more depressing influences. The assassination of the President caused a small panic, which was only prevented from becoming serious by the prompt action of the clearing house committee in offering money at low rates. As it was, however, the average of 20 railway stocks declined 5.52 points and the average of 12 industrials fell 6.58. Closely succeeding this calamity came the revelation that the copper market was oversold, and that the price of 17 cents, which had enabled the Amalgamated Copper Company to pay 8 per cent. dividends, must be reduced. The Amalgamated Copper Company reduced their dividend to 6 per cent. and the stock fell from 120 to 88¾, declining still further to a low point of 60½ in December on a reduction in the price of copper to 13 cents and a further reduction of the Amalgamated dividend. The collapse of Amalgamated was a severe blow to the industrial group, largely because of the great secrecy with which their affairs are conducted. It was generally feared that if the truth were known

concerning others of the recently formed combinations, a condition similar to that of copper might be revealed. Investors lost confidence in industrials, and from September 20 to December 12 their average fell 8.86 points. Banks generally charged higher rates for loans on industrials. The situation was made still worse by the failure of the Everett-Moore syndicate of Cleveland, controlling various electric railway, electric lighting, and telephone franchises, and by the utter collapse, under highly discreditable circumstances, of the American and National Asphalt Company, controlled by Philadelphia capitalists. The stock market after September was almost wholly professional in character, the outside public persistently holding aloof. In November public confidence was revived in some measure by the announcement that the differences between the Union Pacific and Northern Pacific interests, which had brought on the panic of May 9, and which had remained potentially active since that time, had been settled. The terms of the settlement were as follows: (1) The organization of the Northern Securities Company, with \$400,000,000 of capital, to purchase by exchange of stock the Great Northern and the Northern Pacific Companies, which jointly controlled the Burlington; (2) the purchase of the Harriman and Kuhn-Loeb holdings of Northern Pacific preferred stock and its retirement by an issue of Northern Pacific bonds, convertible into the common stock of the same road; (3) the lease of the Chicago, Burlington & Quincy Railroad to a new corporation called the Chicago, Burlington & Quincy Railway, with representation in the latter to the Union Pacific interests, which were also given representation in the Northern Securities Company. The effect of this settlement in restoring public confidence was seriously impaired by the hostility which its announcement caused throughout the Northwest. Governor Van Sant, of Minnesota, announced that he would fight the consummation of the new arrangement by every means in his power, and through the attorney-general of the State brought suit in the United States Supreme Court to prevent the Northern Securities Company from voting or owning the stocks of the Great Northern and the Northern Pacific, on the plea that the formation of this company was in effect a consolidation of competing roads, and therefore not only opposed to public policy, but likely to result in serious detriment to the people of the States through which the two railways in question extended, by depriving them of the benefits of competition. The year in the stock market closed amid general anxiety and apprehension, conservative financiers freely voicing the opinion that the outlook for higher prices was not encouraging.

The course of the money market during 1901 can be readily separated into two periods: (1) A period of easy money, large surplus reserves with expanding loans and deposits, extending from the first of January to the first of May; and (2) a period of higher and irregular rates for money, with small surplus reserves and decreasing loans and deposits. In other words, the course of the money market and the course of the stock market were almost coincident. During the early

months of the year money was abundant in spite of gold exports, and rates remained easy in spite of many calls for money. In March, for example, the Union Pacific paid \$20,000,000 for Southern Pacific stock; the Standard Oil Company declared a 20 per cent. dividend; and the syndicate managers of the United States Steel Corporation called \$25,000,000 from the underwriters, without perceptible effect upon the money market. In April, however, the steady increase in loans and deposits began to have an influence; the surplus reserve declined, and rates rose sharply. The rate of 75 per cent. on May 9 has already been noted. From that date on to the close of the year, the money market was disturbed and uneasy. The sub-treasury gained at the expense of the banks. Large amounts of currency were taken to the West, and the depleted state of the surplus reserve led to a reduction of loans from a maximum of \$902,755,300 to a minimum of \$857,960,000 in December. Deposits also showed a heavy decline. Some relief was afforded by large bond purchases by the secretary of the treasury and by gold imports, but the condition of the money market after June, in spite of the measure of relief thus afforded, was very unsatisfactory. A noteworthy feature was the anxious care with which the leading banking and financial interests guarded the market at every time of stringency. The action of the banks on May 9, in offering large sums at the market rate, thus breaking the rate from 76 per cent. to 6 per cent. for call loans, has already been noticed. In the first week in July the market seemed again to be getting beyond control when the Chase National Bank and the Northern Trust Company offered \$14,000,000 at 6 per cent. Again on Saturday, September 7, when the attack on the President had seriously unsettled confidence, the action of the clearing house committee in offering to loan \$30,000,000 at low rates undoubtedly relieved a situation which might easily have become disastrous. The money market during 1901 was helped over a number of rough places by a liberal policy in regard to loans, where a narrow and selfish policy on the part of the banks would probably have precipitated a ruinous depression. Foreign exchange was generally high throughout most of the year, owing to the disturbed condition of foreign money markets. When the rates fell off during the early autumn below the usual gold export point, much surprise was expressed that gold exports should continue. The reason assigned was that during the contest for the control of the Northern Pacific the participants had sold large amounts of exchange for future delivery, and that the fall shipments were on that account.

Foreign Trade.—The totals of imports and exports of merchandise for 1901 are presented in the following table:

	Imports.	Exports.	Excess of Exports.
January	\$69,307,080	\$136,325,601	\$67,018,521
February	64,501,699	112,957,014	48,445,315
March	75,886,834	124,473,643	48,586,809
April	76,698,131	120,754,190	44,056,059
May	78,642,703	124,567,911	45,925,208
June	68,404,657	102,774,263	34,369,606
July	73,082,435	109,452,510	36,370,075
August	73,127,217	108,027,955	34,900,738
September	66,826,813	106,989,183	40,162,370
October	81,446,763	145,659,415	64,212,652
November	72,566,271	136,455,639	63,889,368
December	79,930,453	136,943,595	57,013,142
Total	\$880,421,056	\$1,465,380,919	\$584,959,863

The significant fact of our foreign trade during 1901 is the rapid increase in monthly imports and a marked tendency toward the reduction of our favorable trade balance. The decline in exports has been especially marked in manufactured products. Thus, for the eleven months ending November 30, 1900, the total value of iron and steel exports was \$119,604,848, and for the same period in 1901, \$94,091,967. The decline of our favorable trade balance in 1901 would have been much greater had it not been for an unusually heavy exportation of breadstuffs, which for eleven months of 1901 exceeded by \$34,756,538 the exports for the same period of 1900. Other lines of manufactured exports show the same declining tendency as iron and steel products. The explanation is found in the general depression of prices abroad coinciding with an advance of prices in the United States, thus encouraging imports and checking exports.

A classification of imports and exports for 1900 and 1901 is presented in the following table:

<i>Imports.</i>		1901.	1900.
Articles of food and animals.....		\$219,934,786	\$219,338,443
Articles in a crude condition which enter into domestic industry		304,031,545	280,380,796
Articles wholly or partially manufactured for use as manufactures and mechanic arts		87,185,552	84,803,857
Articles manufactured ready for consumption.....		138,757,953	132,475,418
Articles of voluntary use, luxuries, etc.....		130,511,120	112,151,200
Total		\$880,421,056	\$829,149,714
<i>Exports.</i>		1901.	1900.
Domestic.			
Products of agriculture		\$940,246,488	\$904,655,411
Products of manufactures		395,144,030	441,406,942
Products of mining		40,416,597	39,222,902
Products of forest		50,491,255	54,481,146
Products of fisheries		7,426,664	8,074,684
Miscellaneous products		4,358,936	5,169,027
Total		\$1,438,083,990	\$1,453,010,112

The most considerable increase in imports were in crude raw materials and in articles of voluntary use and luxuries, which illustrates not only the exceptional industrial activity of the past year, but also the general increase in material well-being. In exports the greatest advance occurred in the class of agricultural products, mainly due to the considerable advance in the prices of breadstuffs and meat products. The decline in manufactured exports has already been indicated and illustrated by the falling off in iron and steel. The failure of mineral exports to show a material advance is noteworthy. The hopes entertained of a substantial increase in coal exports were disappointed, the total amounting to 6,932,659 tons for eleven months of 1901, as compared with 7,145,039 tons for the corresponding period of 1900.

Prices, Bank Clearings, Railroad Earnings, and Internal Commerce.—The prices of 20 staple commodities, as compiled by *Bradstreet's*, are represented in the following table:

	Jan. 1st.	Feb. 1st.	Mar. 1st.	April 1st.	May 1st.	June 1st.	July 1st.	Aug. 1st.	Sept. 1st.	Oct. 1st.	Nov. 1st.	Dec. 1st.	Jan. 1st.
Wheat, No. 2, red winter.....	\$.8025	.79	.785	.79	.808	.81	.722	.732	.75	.74	.765	.812	.87

The general tendency of prices has been upward. The advance in breadstuffs and meat products was mainly due to the shortage in the corn crop. The advance in iron, steel, and coal is a reflection of the unparalleled industrial activity of 1901, a severe car shortage during the autumn months having materially contributed to bring about a scarcity of coal. The metal market was adversely affected toward the close of the year by the decline in copper, which depressed tin and lead. Sugar showed the effect of fresh competition between the trust and the independent refiners. The decline in cotton was mainly the result of a decrease in the foreign demand. The index number of *Dun's Review*, arranged by classes of commodities, gives a general view of the price movement:

	Bread- stuffs.	Meats.	Dairy and Garden.	Other Food.	Clothing.	Metals.	Miscel- laneous.	Total.
1901.								
January.....	\$14,456	\$8,407	\$15,556	\$9,504	\$16,024	\$15,810	\$15,881	\$95,668
February.....	15,062	8,592	13,866	9,418	16,271	15,845	15,966	95,010
March.....	15,070	8,696	13,898	9,396	15,460	15,875	16,471	94,866
April.....	15,221	9,294	13,519	9,208	14,991	15,048	16,629	94,910
May.....	16,112	9,251	14,983	9,154	14,945	15,179	16,596	96,220
June.....	15,635	9,224	13,161	9,116	14,882	15,249	16,532	93,799
July.....	14,904	9,430	11,080	9,086	15,098	15,344	16,617	91,509
August.....	16,668	9,151	13,261	9,253	15,027	15,345	16,625	95,380
September.....	17,369	9,530	13,009	9,153	15,234	16,091	16,625	96,911
October.....	17,146	9,517	13,164	9,190	15,279	15,760	16,835	96,891
November.....	17,840	9,929	13,622	9,157	15,342	15,876	16,977	97,743
December.....	19,528	9,259	15,675	9,061	15,331	15,722	16,782	101,378
January (1902).....	20,002	9,670	15,248	8,952	15,547	15,375	16,798	101,567

It appears from this table that the farming population secured the largest share of the gains from advancing prices. The rise in breadstuffs was about 38 per cent., in meats 15 per cent.; manufactured products scored much smaller advances. The net rise in general prices was 7 per cent. The result of the advance in the prices of foodstuffs was to raise materially the cost of living to the laboring and artisan class. This increased cost of living, however, was largely compensated for by full employment for all classes of labor. The business activity of the year was unparalleled. The tables of bank clearings and railway gross earnings furnish the best evidence of the general prosperity:

Bank Clearings at Twenty Principal Cities.

	1901.	1900.
New York	\$79,427,685,837	\$52,634,201,865
Chicago	7,750,372,450	6,799,535,598
Boston	7,191,685,110	6,180,308,447
Philadelphia	5,475,345,188	4,677,655,906
St. Louis	2,270,737,216	1,688,849,495
Pittsburg	2,046,605,963	1,615,379,044
Baltimore	1,191,867,587	1,191,867,587
San Francisco	1,165,250,091	1,165,250,091
Cincinnati	972,502,450	972,502,450
Kansas City	918,198,612	918,198,612
Cleveland	702,768,639	565,863,286
Minneapolis	626,020,452	579,994,071
New Orleans	602,264,116	556,790,701
Detroit	575,481,632	428,800,385
Louisville	462,060,845	424,555,518
Indianapolis	430,171,791	326,819,577
Providence	349,328,200	326,289,700
Omaha	334,102,066	318,537,040
Milwaukee	327,533,756	298,411,922
Buffalo	302,857,979	259,312,562

These figures show a substantial increase in general business for every part of the country. It is important, however, to observe that while the total clearings of the entire United States increased from 85.7 billion dollars to 117.0 billion dollars, or 37.6 per cent., the clearings outside of New York increased only from 33.1 billion dollars to 38.5 billion dollars, or 16.4 per cent. These outside clearings mainly represent the record of industry and trade as distinguished from the record of speculation, while New York clearings include the record of the Stock Exchange.

The improvement in general business is more accurately reflected by the figures of railway gross earnings:

GROUPS OF RAILWAYS.	GROSS EARNINGS.		Increase.	PER CENT OF INCREASE.	
	1901.	1900.		1901 OVER 1900.	1900 OVER 1899.
Trunk.....	\$ 344,162,108	\$ 316,776,296	\$ 27,385,812	8.6	22.4
Anthracite coal.....	129,618,381	111,028,747	18,589,634	16.7	6.3
Other Eastern.....	100,765,008	95,022,280	5,742,728	6.0	13.3
Central Western.....	115,171,390	104,800,890	10,370,500	10.1	24.9
Grangers.....	181,760,089	169,834,732	12,425,357	7.3	12.3
Southern.....	184,024,636	181,461,346	2,563,290	7.1	21.7
South-Western.....	177,994,266	182,139,426	25,254,840	17.0	24.0
Pacific.....	181,429,451	159,555,870	21,873,581	18.7	30.1
U. S. Roads.....				10.7	20.3
Canadian.....				12.8	17.3
Mexican.....				0.1	12.9
Total.....	\$1,492,782,948	\$1,324,286,533	\$168,496,415		

The greatest advances, it appears from the foregoing table, occurred in Central and Southwestern States and in the Pacific States, but every part of the country shared in the prosperity. The evidence of general prosperity afforded by clearings and railway earnings is confirmed by the record of lake commerce:

Receipts of Freight at Lake Ports for 1901 and 1900.

	1901.	1900.
Coal (tons):		
Anthracite	3,371,254	2,272,456
Bituminous	5,834,510	4,330,485
Flour (barrels)	14,257,020	12,670,890
Wheat (bushels)	63,632,337	52,985,076
Corn (bushels)	37,127,511	71,016,761
Iron ore (tons)	19,429,546	16,769,510
Iron manufacture (tons)	359,692	168,059
Salt (tons).....	666,692	487,932
Copper (tons)	127,050	154,271
Lumber (M. feet)	2,361,016	2,161,043

With the exception of corn, which was in short supply, and copper, which was held off the market, the movement of these staple commodities showed a substantial increase. Distribution shared equally with production in the general prosperity.

From reports to *Dun's Review*, the following summary has been prepared showing statements of conditions in different lines of merchandising and manufacturing business at various cities during 1901, and also, where given, comparison with results of 1900:

Merchandising.	Boston.	Philadelphia.	Baltimore.	Cincinnati.
Drygoods.....	All branches unusually prosperous.	Increase.	Equal to 1900.	Slight Increase.
Cloaks and suits (cloth- ing).....		Increase. +15-20 per cent.	+20 per cent.	Slight Increase.
Boots and shoes.....		Builders+33 pr ct.	+20 per cent.	+2.3 per cent.
Hardware.....		Equal to 1900.	+20 per cent.	Slight Increase.
Groceries.....		Increase.	Slight gain.
Drugs, paints, and oils..				
	Cleveland.	Detroit.	St. Louis.	Kansas City.
Dry Goods.....	+14 per cent.	+10-25 per cent.	+30 per cent.	+17-30 per cent.
Cloaks and suits (cloth- ing).....	+16 per cent.	Hats+12 per cent.
Boots and shoes.....	+14 per cent.	+10-15 per cent.	+15 per cent.	10-40 per cent.
Hardware.....	+17 per cent.	Increase.
Groceries.....	+12 per cent.	+15-25 per cent.	Increase.
Drugs, paints, and oils..	+20 per cent.	Increase.

DANIEL K. PEARSON.

J. PIERPONT MORGAN.

ANDREW CARNEGIE.

Reports from all parts of the country indicate great activity in building operations. In New England the estimated cost of new buildings and engineering enterprises was \$200,000,000, 100 per cent. increase over 1900. In Philadelphia, during 11 months, \$26,711,190 were expended for building, \$7,525,175 in excess of the amount for 1900. In Baltimore the cost of new buildings and improvements was \$4,373,647, as compared with \$3,570,771 in 1900. The general results of 1901 are summed up by *Dun's Review* as follows:

"Superlatives of the most emphatic kind are needed in delineating the financial and commercial progress of this nation during 1901. Despite the elements, strikes, speculative panics, foreign disasters, and the assassination of President McKinley, the first year of the new century was productive of many new high records of prices, output, and distribution. It was in this last respect that results were most satisfactory; for prices have often been inflated beyond reason, and heavy production exceeded needs until accumulated stocks caused disastrous reactions. In the year just ended, however, the unparalleled output of manufactured goods did not result disastrously, consumptive demand not only keeping pace with, but often running far ahead, of available supplies. Phenomenal shipments brought the greatest railway earnings ever attained, yet the year closed with congestion at many points because transporting facilities were utterly inadequate. Bank exchanges, the best measure of trade after making due allowance for speculative activity, far surpassed all previous records. Labor disputes were numerous and stubborn, yet all reached amicable conclusion with less bloodshed and destruction of property than in earlier years, while the formation of a committee of conciliation promises fewer prolonged controversies hereafter. The new year opens most auspiciously, and the rising tide of prosperity should bring many new high-water marks."

FINE ARTS. See ARCHITECTURE, PAINTING, SCULPTURE, and MUSIC.

FINLAND, a Russian province on the Gulf of Bothnia, has an area of 144,255 square miles, of which over 11 per cent. is under lakes, and a population of about 2,700,000, of whom about 83 per cent. are Finns. The largest city and capital is Helsingfors, the population of which (with Sveaborg) numbers about 85,000. Over 90 per cent. of the inhabitants are Lutherans. In education and in the general advancement of civilization, Finland is superior to the other parts of Russia. Except along the eastern frontier there are scarcely any illiterates.

Government and Finance.—As a grand duchy Finland had a constitution, and this, though of late violated by Russian authority, still continues. It provides for a diet and a senate. Members of the latter, which is the chief administrative power, are nominated by the crown, and its president is the governor-general of the province. The departments of war and of foreign affairs are directly under the Russian authorities at St. Petersburg. The estimated revenue and expenditure for 1899 were reported to balance at 88,508,916 marks. The public debt amounts to 115,028,841 marks. The value of the Finnish mark is 19.3 cents.

Industries, Commerce, etc.—The principal crops are rye, barley, oats, and potatoes. The forests are very extensive, and large quantities of timber and wood-pulp are exported; the wood-pulp industry in recent years has greatly increased. Iron production is important, and there are a number of successful manufacturing industries. The trade of Finland is not included with that of Russia proper, and it has different and, in general, much lower tariffs. The imports and exports in 1899 were valued at 251,000,000 marks and 184,900,000 marks respectively; in 1900, 270,800,000 marks and 197,700,000 marks respectively. In the former year the leading exports were: Timber, 98,200,000 marks; butter, 23,600,000, and wood-pulp, paper, and cardboard, 17,700,000. The chief imports in 1899 were: Cereals, 53,300,000 marks; iron, iron-ware, and machinery, 32,700,000; woollen goods, 12,100,000; cotton goods, 11,800,000, and sugar and coffee. The greater part of the trade is carried on with Russia, Germany, and Great Britain. There are about 1,600 miles of railway, almost all of which is owned by the state. It was for railway construction that the public debt was incurred.

History.—The "Russification" of Finland has gone steadily forward since the grand duchy was made a Russian province by the imperial edict of February 15, 1809, and so thoroughly is Russian authority being introduced that the recent remark of General Bobrikoff, the Russian governor-general, "Finland is merely a geographical conception," unlike Metternich's similar saying concerning Italy, contains a solemn truth. In the edict just mentioned the czar said: "We have found it necessary to reserve to ourselves the ultimate decision as to which laws come within the scope of the general legislation for the empire," while at the same time the governor-general was given the right to veto any law enacted by the Finnish diet. Accordingly this body is deprived of its constitutional powers. By the ukase of June 26, 1900, the Russian government authorized the gradual introduction of the Russian language in all the official departments and public offices of Finland; thus, within a period of five years all Finns ignorant of Russian would be debarred from office

and the positions of course filled by Russians. How far-reaching in its consequences is this edict may be seen in the fact that out of the total population only about 8,000 persons—and those are chiefly along the Russian border—are able to speak Russian. Then followed a sweeping censorship which prohibited even the publication of the proceedings of the diet; as compared with 40 interferences with the press in 1897 and 12 in 1898, there were 375 in 1899 and nearly 1,000 in 1900. This censorship continued throughout 1901; in May it was reported that the censors had been ordered to prevent the publication of complaints or criticism against the police and of reports of trials of persons making such charges. About the same time it was announced that the senate had been ordered by the czar to prohibit the use of Finnish postage stamps, which for some time, as an expression of national feeling, had been used in addition to the Russian stamps. Very soon after his accession to power, General Bobrikoff prohibited any meetings for political or economic discussion, and more recently severer restrictions have been placed upon the formation and assemblage of societies, including scientific and literary bodies. The Russian government also has interfered with religion and education in Finland. Although there are only some 45,000 members of the Orthodox Church in the province, no one not a communicant of that church may hold office in the higher administrative departments, while throughout the country Russian churches, supervised by Russian priests, have been established. A reform in the school system of Finland, a country preeminent for its literacy, by a government which has seldom shown itself kindly disposed toward education, and of whose subjects, moreover, nearly 60 per cent. are unable to read and write, seems an anomaly. But the gradual substitution of the Russian language for the Finnish in all elementary schools has begun, and since few Finnish teachers know Russian, it will not be long before they will be replaced by Russian teachers and all the children of the province subjected to Russian influence. In the higher schools a study of Russian has been made compulsory, and the hours devoted to the study of Russian history, geography, and religion have been extended. A Russian has been appointed to the chancellorship of the famous University of Helsingfors, and it was reported in the fall of 1901 that, pursuant to a governmental edict, Russian would supersede Swedish and Finnish as the language in which lectures are delivered at that institution. Few of the professors are proficient in Russian; and so the university, like the schools, will become Russian both in language and in teaching corps.

Some surprise was occasioned late in February, 1901, by the defeat in the Russian council of state, by a large majority, of the project of "Russifying" the Finnish army. This defeat, which was temporary, appeared to be brought about largely through the efforts of M. Witte, the Russian minister of finance, whose influence is gradually embracing all departments of governmental administration. It was pointed out, however, that the council of state, though the highest administrative institution in Russia, is merely a consultative body, "whose opinion can be and often has been set aside by the sovereign without the least difficulty." This seems to have been the case in 1901; for on July 11 an imperial edict was promulgated, according to which the Finnish militia, which formerly could not be sent outside of the province, and which was commanded by Finnish officers, became a part of the Russian army, commanded by Russian officers in the Russian language, and liable to be sent to any part of the empire. The annual quota was raised from 1,920 men to 7,200 men between the ages of 20 and 22, and the time of active service was extended from 3 to 5 years. This means that Finland must maintain an active army of 36,000 young men, the loss of whose labor is already keenly felt. Formerly emigration from Finland was very small, but notwithstanding severe restrictions, 16,000 young men left the country in 1899 and 36,000 in 1900. This edict was laid before the Finnish senate, and, though clearly opposed by that body and notwithstanding its apparent unconstitutionality, was approved on August 1. At the same time the senate solicited the czar to assure the maintenance of Finland's local institutions. The czar's reply, through the secretary of state for Finland, seemed to be a severe rebuff, stating that "his Majesty does not find the present occasion suitable to address, as the senate desires, to the Finnish people new assurance as to the maintenance for the future of their local institutions. As to his Majesty's good intentions in this respect, his faithful subjects cannot be in doubt. The disquieting apprehensions which are now by evil-minded people being disseminated among the population point to the necessity of securing public order by means of administrative measures." Among other things, "administrative measures" seem to mean the suspension of legal trial, and it was pointed out that the four senators who voted against the promulgation of the military service law had been summarily dismissed because they "failed to comply with his majesty's orders and commands." As an outcome of a meeting of the diet in August a petition to the czar, signed by 471,131 persons, was laid before the senate on September 30. The petition characterized the new military law as "a far-reaching infringement of the fundamental laws of the grand duchy," and went on to state that the Finns had shown their "readiness to

FIRE EXTINGUISHING APPARATUS.—Fire Engine of 1901

Courtesy International Fire Engine Co.

increase in proportion to their strength Finland's share in the defense of the empire," but that while they were not petitioning "for any alleviation in the present military burden," they could only hold that the new military law "manifested a distrust for which the Finnish people," during nearly a century's union with Russia, had "in no way given occasion."

FIRE PROTECTION. The danger of overhead trolley and electric wires to firemen, when fighting fires, was discussed in a paper read by Morris W. Mead, superintendent of the Bureau of Electricity of Pittsburg, before the International Association of Fire-Chiefs, at their 1901 meeting in Indianapolis. Mr. Mead contended that all electrical circuits should be run in parallel, and at regular intervals run off to switches, and that such locations should be numbered and blue prints of every switch and of the location of every circuit should be prepared and kept on file at the headquarters of the fire department. The firemen should be trained in handling the switches, as well as in general electrical principles, so as to understand the easiest and safest way of operating them in case of emergency. Trolley wires should be arranged on the same principle, so they may be cut out at every 1,000 or 2,000 feet in crowded cities, and these cut-outs should be carefully marked and records of them placed on file at department headquarters. In the larger cities, one or two electricians should be attached to the fire department and go to all fires, to assist and to instruct the members of the department in self-protection from high potential currents. Another arrangement which Mr. Mead suggested for the protection of firemen was that all electric light and power companies, including trolley lines, should have thoroughly equipped wagons, located at reasonable intervals along their lines, with competent men in charge, to respond in every case of fire. Gongs connected with the fire department lines should be at all such wagon stations, and, if necessary, there should be two crews attached, to relieve each other, or else to sleep there regularly, as firemen do, and answer calls both day and night. A more radical remedy was also suggested, that cities compel all wires to be placed underground, at least in the business portions and on the main avenues.

The legal aspect of the relation between fire protection and an adequate water supply has again been brought to the front by the failure of the Greensboro Water Supply Company, at Greensboro, N. C., to furnish sufficient fire service during a fire which destroyed a hotel, in June, 1899. The water company was sued for \$40,000 damages and early in 1901, in a jury trial, \$25,000 damages was awarded against the company.

Perhaps the most notable additions, in the way of fire fighting equipment, made during 1901 were the seven steam fire engines built by the Mansfield (Ohio) Machine Works for the city of Cleveland. The steam cylinders of these engines are $7\frac{3}{4}$ inches in diameter, the water cylinders $4\frac{3}{4}$ inches in diameter, and the stroke 8 inches. The results of the tests of five of these engines were about the same. The fifth engine gave the following results: In all the trials the hose used was $2\frac{1}{2}$ inches in diameter and 150 feet in length. With one line of hose, a $1\frac{1}{8}$ -inch fire nozzle, and 135 pounds of steam pressure, water was thrown a distance of 255 feet. Under the same conditions, but with two lines of hose and 200 pounds water pressure, a stream was thrown 240 feet. With one line of hose, same size and length as above, but with a $1\frac{1}{4}$ -inch nozzle, 130 pounds steam and 265 pounds water pressure a stream was thrown 275 feet. In the next two trials two lines of hose, each 100 feet long, were "siamesed" or connected to one length of 50 feet of hose. On applying a steam pressure of 130 pounds and a water pressure of 240 pounds, water was thrown to a distance of 263 feet through a $1\frac{1}{2}$ -inch nozzle and with a $1\frac{3}{4}$ -inch nozzle and 210 pounds pressure, the steam conditions being the same, water was thrown 250 feet.

FISH AND FISHERIES. The Second International Conference for the Exploration of the Sea, which is actually a conference for the scientific study of fishery questions, met at Christiania, Norway, during the second week of May, 1901. Delegates were present from all the countries of northern Europe, and also from Great Britain, and among them were a number of well-known biologists. The work was chiefly the revision and completion of the programme adopted at the first conference, held in Stockholm two years before. This programme falls under two headings, "Hydrography" and "Biology." The former was easily disposed of, but the biological programme was finally recast and caused much discussion, although every decision reached was harmonious. The organization of the scheme of international research was completed only in part, since several points required reference to the governments concerned. The biological programme adopted includes the biology of food fishes, their distribution in all stages of growth, their life histories, migrations, etc.; the quantitative distribution of pelagic eggs, larvæ, and young fishes, the collection of material showing local varieties of plaice, herring, and mackerel; the study of the plankton and bottom fauna, especially with reference to the nutrition of food fishes; and lastly, the elaboration of fishery statistics so as to yield data for making maps of the fishing grounds, and for determining the influence of physical conditions

on fish. The Conference proposed the establishment of an international council, a central bureau, and an international laboratory, to direct the operations, and it urged the governments interested not only to undertake the support of these bodies, but also to provide steamers to carry on the work. It was further urged that the programme be carried out for not less than five years, beginning in the spring of 1902.

As shown by the interest in this conference, the importance of fisheries is coming to be more and more clearly seen in Europe. The United States has long given special attention to the subject, and our fisheries are in excellent condition, but in Great Britain there is much complaint over the condition of the industry. The year 1901 saw much discussion of the situation, and it was stated that Parliament is uninterested and is unwilling to appropriate funds necessary for ascertaining the facts. It is claimed that trawling is ruining the fishing grounds, and scientific methods of replenishing them are not used. Moreover, it is said that the protection of gulls and other sea-birds is resulting in a great increase in their numbers, and as they are fish-feeders, their competition is really being felt by the fishermen. In other countries, however, investigations into the condition of the fisheries have been carried on with marked success. The marine resources of the West Indies were carefully considered at a conference held in Barbados early in 1901. The yearly value of the fish caught in Jamaica alone is about \$150,000, while nearly five times that amount is imported. It is urged, that with improved methods of fishing, the local supply might be greatly increased. The feature of the conference was the paper by Dr. J. E. Duerden, on *The Marine Resources of the British West Indies*. This has been published in pamphlet form, and is a valuable contribution to the literature of the fishing industry. It shows conclusively what the government ought to do to put that industry on a firm foundation in the West Indies. During 1901 our own government investigated the marine resources of the Hawaiian Islands (see ZOOLOGICAL EXPEDITIONS). The results are not yet tabulated, but there is reason to believe that the investigations will lead to great improvements in the methods used and in the results obtained.

The fish and fisheries of Japan were the subject of a very large amount of literature during 1901. It will be remembered that during 1900, Dr. Jordan and Dr. Gilbert visited Japan and made extensive collections of fish. The *Albatross* also collected there, and other collections came into the hands of Jordan and Gilbert, who have now published a large part of their results. Dr. Jordan has also published accounts of the geographical distribution of Japanese fishes, but some of his conclusions have not met with universal acceptance. About 1,100 species of fish are recognized by Jordan as occurring in Japan, of which only 50 are fresh-water. The latter are all distinctively Asiatic. The marine fishes occur in five fairly distinct faunal areas, of which the northernmost is clearly sub-arctic, while the two southernmost are tropical, one of them showing Polynesian and the other East Indian features. Another contribution has been made to our knowledge of the fish fauna of Lake Tanganyika, and the remarkable fact has been brought out that the former connection of that lake with the ocean was probably not to the northeastward, as had been surmised, but westward through the valley of the Congo. About 90 species of fish are known from Tanganyika and Kivu, of which 75 were new to science when first taken in those lakes.

It is worth noting that the smallest known fish and the largest known deep-sea fish were both described during 1901. The former is not only the smallest known fish, but the smallest of vertebrates, for the adults measure from 10 to 15 mm. in length, the average being less than 13 mm. It is found only in Lake Buhi, Luzon, but is extremely abundant there, and although so small it is an important article of diet among the natives. It has been named *Mistichthys luzonensis* by Dr. H. M. Smith, the name meaning *smallest fish of Luzon*. The largest deep-sea fish was captured by the *Albatross*, off the coast of southern Chile, at a depth of 1,050 fathoms, and was about 5 feet long. Unfortunately, after a photograph of it had been taken, the fish was accidentally thrown overboard and lost. The capture was made some years ago, but the description has only just been published by Gill and Townsend, under the name *Macrías amissus*, which refers to the large size and the lost specimen. Early in 1901 some observations of much interest were published on the food of the cod. An examination of several hundred stomachs showed that the food is almost wholly made up of crustaceans, chiefly *Panopeus*, but hermit crabs and young lobsters were found. The presence of the latter may throw some light on the great decrease of lobsters in recent years; for, thanks to the United States Fish Commission, the number of cod-fish has greatly increased.

In this connection it is proper to mention the important work, begun by the Commission in 1900, and continued during the past year, on the artificial culture of lobsters. The great difficulty has always been to keep the young alive. Usually they become covered with parasites and die. Various inclosures have been tried with

FIRE EXTINGUISHING APPARATUS.—Hose Wagon of 1901.

more or less success, but the best are large bags of scrim, 3 feet in diameter, and 4 feet deep, in which the water is kept agitated either by the tides or artificially. It has been found that the most important thing is to keep the young off the bottom. Growth is rapid, and the so-called "lobsterling" stage, which occurs after 3 moults, may be reached in 9 or 10 days. The work during the summer of 1901 proved very encouraging, and great hopes are entertained by those in charge that it will be possible to replenish the depleted waters of the New England coast with an abundance of healthy young lobsters. Along other lines the Commission has had a successful year, although little of the routine work is reported in current literature. The *Fish-Hawk* has been employed along the east coast of the United States, at Wood's Hole, Beaufort, and in Florida, while the *Albatross* has been for a large part of the year among the Hawaiian Islands. The records of the work of the *Albatross* were published during 1901. They cover the eighteen years she has been in commission. During that time she made 1,786 hauls of the dredge and trawl, at depths varying from less than 100 to more than 4,100 fathoms. The greatest depth (4,173 fathoms), is the deepest dredge haul ever made. She has also made more than 4,000 soundings, giving character of the bottom as well as depth. Nearly 2,000 species of animals, largely deep-sea fishes and crustaceans, new to science, have been collected by the *Albatross* and many have been described. For accounts of the work of the *Albatross* during 1901, and the work of the Fish Commission stations at Wood's Hole and Beaufort, see ZOOLOGICAL EXPEDITIONS AND STATIONS.

FISKE, JOHN (EDMUND FISKE GREEN, the name Fiske being that of his maternal grandfather), American historian and philosopher, died at Gloucester, Mass., July 4, 1901. He was born at Hartford, Conn., March 30, 1842, and graduated at Harvard College in 1863. Although a graduate of the Harvard Law School (1865) he never practiced, choosing rather to pursue a scholar's career. In 1869 he became lecturer in philosophy at Harvard and an instructor in history in 1870, and from 1872 to 1879 was an assistant librarian of the college. At 19 he had attracted attention by an article in the *National Quarterly Review* on *Mr. Buckle's Fallacies* (1861), and from that time he occupied a prominent place among the American advocates of the theory of evolution and the Spencerian philosophy, his *Cosmic Philosophy* being probably the clearest exposition of these doctrines ever published. His discovery of the causes of the prolonged infancy of mankind, and the part played by it in determining human development (1871), was one of the most important contributions to the Darwinian theory. After 1871 Mr. Fiske was best known for his lectures on American history, which he delivered throughout this country and Great Britain, and for his publications dealing with the same subject. He lectured at University College, London, in 1879 and at the Royal Institution of Great Britain in 1880. In his historical writings he was an avowed popularizer rather than a thorough investigator. While not a final authority, therefore, he nevertheless infused into his work a spirit genial and broad enough to make it readable for its own sake instead of merely as history. He covers the history of the United States from the earliest discoveries to the year 1789 in a clear, minute style, and may be said to have done more than any other historian to spread the story of that period. Mr. Fiske occupied a place in American literature notable for the character of his labors, his prodigious industry, and a magnetic personal charm that endeared him to all who met his influence. He was a joint editor with James Grant Wilson of *Appleton's Cyclopaedia of American Biography* (6 vols., 1887-89); and his other works include *Myths and Myth-makers* (1872); *Outlines of Cosmic Philosophy, Based on the Doctrine of Evolution* (1874); *The Unseen World* (1876); *Darwinism and Other Essays* (1879); *Excursions of an Evolutionist*, (1883); *The Destiny of Man Viewed in the Light of His Origin* (1884); *The Idea of God as Affected by Modern Knowledge* (1885); *The Critical Period of American History* (1888); *The Beginnings of New England* (1889); *The American Revolution* (2 vols., 1891); *The Discovery of America* (2 vols., 1892); *History of the United States for Schools* (1894); *Old Virginia and Her Neighbors* (2 vols., 1897); *Dutch and Quaker Colonies* (1899); *The Mississippi Valley in the Civil War* (1900); *Through Nature to God* (1900); *Life Everlasting* (1901); and, posthumous, *The French and English in America*.

FITZGERALD, GEORGE FRANCIS, F.R.S., professor of natural and experimental philosophy in the University of Dublin, died February 21, 1901. He was born in Dublin in 1851, and received his education at Trinity College, Dublin, where he graduated in 1871. Becoming a fellow in 1877, he served as tutor until 1887, when he was appointed professor of experimental philosophy. He devoted himself to theoretical and experimental investigation, and in 1878 published an important memoir *On the Electromagnetic Theory of the Reflection and Refraction of Light*, which is considered a classic among the works of modern physical science. In 1899 he received one of the royal medals of the Royal Society, of which he had been elected a fellow in 1883. He was also a member and for many years secretary of the Royal Dublin Society. His researches dealing with the electromagnetic theory of light did much

to promote the study of that subject, and he was considered one of the leading mathematical physicists of the nineteenth century.

FLAX. In the United States flax is grown almost exclusively for the seed, from which linseed oil is made. Sometimes the straw, which is generally inferior, is used in tow or paper mills. The estimated area under flax in 1901 was considerably over 3,000,000 acres, and the crop—the largest ever produced in this country—was about 26,000,000 bushels. This was raised chiefly in North Dakota, Minnesota, South Dakota, Kansas, and Iowa. The production of British India in 1901 is stated at 8,625,547 bushels. The world's crop for 1900 is reported at 64,466,500 bushels, as against 61,726,600 bushels in 1899 and 72,938,500 bushels in 1898. Of the 1900 crop 32 per cent. was produced in Russia, 31 per cent. in the United States, 18.6 per cent. in India, and 13.75 per cent. in Argentina. Of these countries, Russia alone gives attention to the production of flax fibre. The world's fibre crop of 1900 amounted to 1,312,709,000 pounds (of which about 77 per cent. came from Russia), as against 1,139,077,000 pounds in 1899 and 1,780,693,000 pounds in 1898. In 1901 the United States imported 6,878 tons of fibre valued at \$1,880,717, as against about 7,000 tons in 1900 valued at \$1,646,274. Scarcely any of the forty to fifty million gallons of linseed oil produced in the United States is exported. There has been in recent years a very great decline in flax production in France and Ireland.

FLINT. This is a commercial term for quartz which is used in the manufacture of whiteware, porcelain, and other high-grade clay products. The production of crude flint in the United States in 1900 amounted to 18,611 short tons, valued at \$134,553, while the ground material was 13,884 short tons, valued at \$44,798. This does not represent the total consumption, for much flint is imported from England and France in the form of flint nodules, which are ground after reaching this country.

FLORIDA, the southernmost State of the United States, has an area of 56,680 square miles. Florida was organized as a territory, March 30, 1822, and admitted as a State, March 3, 1845. The capital is Tallahassee. The population in 1900 was 528,542, while in June, 1901, as estimated by the government actuary, it was 543,000. The populations of the four largest cities in 1900 were: Jacksonville, 28,429; Pensacola, 17,747; Key West, 17,114, and Tampa, 15,839.

Finances.—The receipts of the treasury for the year ending December 31, 1901, were \$1,480,909.86. On December 31, 1901, the State debt, which was neither increased nor diminished during the year, amounted to \$1,032,500, all of which was bonded. The tax rate for 1901, which will hold for 1902, was 5 mills per \$1, made up as follows: Revenue for general expenses of State, 2½ mills; revenue for schools, 1 mill; revenue for pensions, 1 mill, and revenue for health department, ½ mill. The total value of State property in 1901, as returned for taxation, was \$97,551,192.17.

Industries.—The census reports of 1900 indicate a steady growth in manufacturing interests in Florida since 1850, although agriculture and the exploitation of mineral resources are the principal industries of the State. Since 1850, the population has increased from 87,445 to 528,542, and the average of industrial wage-earners from 991 to 37,094, embracing in 1900 7 per cent. of the entire population. In the latter year the amount of actual capital, exclusive of capital stock, invested in 2,115 establishments reporting, was \$34,473,997, the gross value of the products \$38,189,894, and the net value, exclusive of products re-used in the process of manufacture, \$29,235,085. The most important manufactures of Florida are due, first, to her forests, and secondly, to her tobacco fields, coupled with the large immigration of Cuban tobacco-makers. The tobacco manufacture ranks first in importance in the State, with a product in 1900 valued at \$10,891,286, as compared with \$8,123,220 in 1890. Havana tobacco is used for the most part, more tobacco leaf entering at the port of Tampa than at any other port except New York in 1899-1900. Florida tobacco is also largely used, the Cuban "filler leaf" grown there bringing the highest price of any domestic filler leaf, while the so-called Sumatra "wrapper leaf" grown in Florida was rated at the Paris Exposition higher than that grown in Sumatra. Rich veins of phosphate rock were discovered in the State in 1888, and in 1889 the production had become nearly one-half the total production of the country, 440,000 tons of this being exported. Increasing quantities are being retained in the State for manufacture into fertilizers, the product in 1900 being valued at \$555,394, as against \$86,137 in 1890.

Forests and Forest Products.—The most valuable natural resource of Florida is its forests, estimated to cover 25,000,000 acres, and composed largely of pitch pine, from which turpentine is produced, and of live oak, used in shipbuilding. In 1900, the value of the products of the industries dependent upon the forests amounted to \$18,897,495, or 49.5 per cent. of the total value of the products of the State. The items of this total were: Lumber and timber products, \$10,848,403, an increase of 96.7 per cent. since 1890; the manufacture of tar and turpentine, \$7,794,101, as com-

pared with \$191,859 in 1890; and shipbuilding, \$254,991, an increase of more than 200 per cent. in the last decade.

Congressional Representatives (57th Congress).—In the House: Stephen M. Sparkman, from Tampa, and Robert W. Davis, from Palatka, both Democrats. In the Senate: Stephen R. Mallory (until 1903), from Pensacola, and James P. Taliaferro (until 1905), from Jacksonville, both Democrats.

State Officers.—Governor, William S. Jennings, Democrat, elected for four years, term expires in January, 1905; secretary of state, John L. Crawford; controller, A. C. Croom; treasurer, James B. Whitfield; attorney-general, William B. Lamar; commissioner of agriculture, B. E. McLin; commissioner of education, William M. Sheats; chief justice of the Supreme Court, R. F. Taylor, term six years, expires in January, 1905; associate justices, M. H. Mabry and F. B. Carter—all Democrats.

FLUORSPAR. The production of fluorspar in the United States in 1900 is given as 18,450 short tons, valued at \$94,500, as against 15,900 short tons, valued at \$96,650 in 1899. The decrease in value is due to much of the material being marketed in the crude condition. Over 80 per cent. of the 1900 production came from Caldwell, Crittenden, and Livingston counties in Kentucky, these localities being first reported as producers in 1896. The remaining 20 per cent. came from the old locality of Rosiclare, Ill. Fluorspar is used in the manufacture of hydrofluoric acid and also in iron smelting to a limited extent, though its higher first cost prevents it from competing seriously with limestone for this purpose. It is also used in the manufacture of opalescent glass.

FLYING MACHINES. See AERIAL NAVIGATION.

FOOD. Late in 1901, a government blue-book was published in England, containing reports of testimony taken between July, 1899, and May, 1900, by a departmental committee. Seventy-eight persons, comprising physicians, chemists, pharmacists, factors, and purveyors, were examined before the committee, and the use of preservatives and coloring matters in foods and beverages was investigated. Dairy companies testified that it was necessary to use coloring matter in milk much of the year, to avoid complaints from consumers that the milk was pale and therefore not pure. It was ascertained that borax and boric acid were used (usually mixed and termed "boron") in preserving meats, butter, and milk. Salicylic acid was found in common use as a preservative for jams, jellies, and similar foods. A mixture of boric acid and borax is used, in the proportion of 8 ounces to the hundred pounds, as a partial substitute for salt in butter. Opinions differed diametrically as to the healthfulness of this customary adulterant. The committee concluded that the use of formaldehyde or of formalin or its preparations in foods or drinks should be absolutely prohibited; that salicylic acid in greater proportion than 1 grain per pint in fluids and 1 grain per pound in solids be prohibited; that the presence of salicylic acid be declared; that the use of any preservative or coloring matter in milk be constituted a punishable offense; that boric acid mixtures alone be allowed in cream, in the proportion of 0.25 per cent. or less, the amount of such preservative to be noted on the label upon the container; that boric acid mixtures alone be allowed in butter or margarine, in proportions not exceeding 0.5 per cent.; that all infant or invalid foods be free from all preservatives; and that the employment of copper salts in greening preserved foods be prohibited.

FOOTBALL. The opening of the American football season of 1901 was marked by the absence of any notable change in the rules governing the eastern colleges' play, and by the general adoption in the West of the Chicago conference rules. In neither section is it so important to amend the existing rules as it is to insure a liberal interpretation of them, and their enforcement at all times. An unwritten law has grown up, that, after all, the umpire is the best judge of when and where a rule shall operate.

Harvard had the heaviest team, well instructed and carefully drilled. It defeated Wesleyan, 16—0; West Point, 6—0; the Indians, 29—0; Brown, 48—0; Pennsylvania, 33—6; Dartmouth, 27—12, and Yale, 22—0.

Yale's tackles and backs were lighter than in 1900, and failed thereby successfully to carry out the tactics so successful then. Nevertheless, her only serious competitor was Harvard. She defeated Bowdoin, 45—0; Pennsylvania State, 22—0; Columbia, 10—5; Princeton, 12—0; tied with West Point, 5—5, and was beaten by Harvard, 0—22.

Princeton's consisted chiefly of new men, not quite up to the university's old form, yet it defeated Brown, 35—0; Lafayette, 6—0; Cornell, 8—6; tied West Point, 6—6, and was beaten by Yale, 0—10.

West Point had the best record in its history, winning from Williams, 15—0; Pennsylvania, 24—0, and Annapolis, 11—5; tied Yale, 5—5, and Princeton, 6—6, and was beaten by Harvard, 0—6.

Cornell had an exceptionally good team in 1901. She won from the Indians,

17-0; from Oberlin, 20-0; from Columbia, 24-0; from Pennsylvania, 24-6; and was beaten by Princeton only by 6-8.

Annapolis, whose team play was excellent, defeated Lehigh, 18-0; University of Pennsylvania, 6-5; the Indians, 16-5; Washington and Jefferson, 17-11; and was beaten only by Pennsylvania State, 6-11, and West Point, 5-11.

Columbia beat University of Pennsylvania, 11-0; Haverford, 29-6, and the Indians, 40-12; but fell before Yale, 5-10; Syracuse, 5-11, and Cornell, 0-24.

Lafayette's team was a strong, heavy eleven, which gave even Princeton a bad quarter of an hour. *Pennsylvania* has not been so unsuccessful since 1890. *Dartmouth's* material was good, and in the match with Harvard proved itself well coached. *Williams* had her best team in years. *Syracuse* was the only successful lightweight team of the year. It won against Columbia, 11-5; Brown, 20-0; and held Lafayette to 0-5. *Wesleyan* made a good finish, after a poor start; and *Amherst* reversed this by starting better than she ended.

Among the southern teams, Tennessee, Gallaudet, Georgetown, St. Johns, Virginia, North Carolina, and Sewanee were in the front rank.

The West had made great strides in play over previous years, Michigan certainly ranking next to Yale, and Wisconsin a close follower, while Minnesota, Northwestern, Illinois, Chicago, and Iowa were all equal to Columbia's eastern form. *Michigan* scored in her various matches 501 points to 0. Among those that went down before her were Northwestern, 29-0; Chicago, 22-0; Beloit, 89-0; Iowa, 50-0. *Wisconsin* won from Nebraska, 18-0; Chicago, 35-0; Minnesota, 18-0. *Northwestern* beat Chicago, 6-5, and Illinois, 17-1.

FORD, EDWARD ONSLOW, English sculptor, died in London, December 23, 1901. He was born in London, in 1850, and was educated in art at Antwerp and at Munich. In 1872 he first exhibited at the Royal Academy, and from that time forward was a popular and successful artist. In 1883 he executed a statue of Sir Henry Irving, which attracted a great deal of attention, and which was placed in the Guildhall Art Gallery. A statue of Mr. Gladstone was made by him in the same year for the City Liberal Club, and following this came figures of Professor Huxley, Dr. Dale, the Duke of Norfolk, and the imposing statue of Queen Victoria for the city of Manchester. The Shelley memorial at Oxford and the Strathnairn monument in London are among his other well-known works. The Ruskin medallion, ordered for Westminster Abbey in 1901, was his latest production. Mr. Ford's work was a blend of the decorative and the realistic, and much of it possessed a genuine poetic charm.

FOREIGN MISSIONS, AMERICAN BOARD OF COMMISSIONERS FOR. See AMERICAN BOARD OF COMMISSIONERS FOR FOREIGN MISSIONS.

FORESTRY. The year 1901 was a notable one in the history of forestry in the United States. The acts of State legislatures and the reports of State and national officers show a rapidly increasing interest in the subject, and evidence is everywhere present that the people of the country are awakening to an appreciation of the true value of our forests. Increasing numbers of private individuals and lumbering corporations are applying to the Bureau of Forestry of the United States Department of Agriculture for assistance in the national management of their timbered lands. Not only are cabinet officials giving heed to the importance of scientific forestry, but the President advises Congress that "the preservation of our forests is an imperative business necessity." A number of carefully prepared papers by recognized authorities have appeared in different countries in which the prophecy is made of a failure at no distant date of the world's timber supply unless radical measures are taken to conserve and exploit properly what now remains. These alarms have been repeated in many languages, and it is generally believed that the consumption of timber is progressing at a much greater rate than normal production. The ability of the United States to continue its great exports much longer is doubted, and the reserve stock of Canada, the north of Europe, and Siberia is all that is left. The estimate of the geographer of the United States Geological Survey, that 37 per cent. of the United States is forest area, has been challenged on many sides. One statistician, who has carefully considered the subject, believes the productive forest area is only about 570,000 square miles, or a little more than half the estimate given by the Survey report. From this estimate, instead of a supply equal to all demands for half a century, by which time much timber would be grown, the visible supply will last but twenty-five or thirty years. It is claimed that the Geological Survey in making its estimate has included as forest area mountains that support only a stunted growth as well as areas that have been lumbered of their valuable timber and then grown up with jack pine, alder, etc., as is the case in parts of Michigan, Wisconsin, New Jersey, etc. The superintendent of forest ranges of Quebec in his recent report estimates the spruce forests of that Province at 144,303,000 acres, with an annual consumption of 803,750 acres. At this rate, if there is no increase in consumption, the present supply will last for about 170 years. When the rapid

reproduction of spruce is considered, the supply is thought to be practically inexhaustible.

Timber Cutting.—The amount of lumber and timber produced by the mills of the country cannot be estimated with more than reasonable accuracy, as there are still companies which decline to furnish data regarding their output. From the *American Lumberman*, which has compiled very extensive tables, the following data are taken. During 1901, Michigan, Minnesota, and Wisconsin, which are believed to have furnished 25 per cent. of the timber cut during the year, produced of pine 5,428,000,000 feet board measure; hemlock, 1,200,000,000 feet; and hardwoods, 1,250,000,000 feet, making a total output for the mills of the three States of 7,828,000,000 feet. If the estimate on the 25 per cent. basis is correct, the total output of the United States would be 31,312,000,000 feet. The cut of southern pine, as returned by 160 mills operating during 1901, was 1,992,602,851 feet, an increase of 11 per cent. over the previous year. For the first time reasonably complete statistics have been obtained for the Pacific States. The stock on hand and output of the mills of Washington, Oregon, and California, reported for 1901, was 2,480,571,000 feet of fir, cedar, spruce, redwood, pine, and hardwoods. Adding the estimated capacity of known mills which did not send returns, the total for the Pacific Coast may be placed at three billion feet. The returns available from the census of 1900 show an increase of 192 per cent. in the capital and 152 per cent. in the value of the output of turpentine, resin, and other naval stores and their products over the previous census.

The Department of Agriculture.—One of the most important events in the history of scientific forestry in the United States was the reorganization of the Division of Forestry into the Bureau of Forestry with considerably enlarged scope, working force, and resources. The bureau, as now constituted, consists of three divisions: forest management, forest investigations, and records. Each of these divisions continues in an enlarged way the work which was in progress under the former organization. The division of forest management prepares working plans for wooded areas under terms of cooperation between the owners and the division. For tracts of less than 200 acres the owner is at no expense whatever. For larger tracts, all expenses, except salaries of the regular employees of the bureau, are paid by the owner, and in return he is given expert advice on the management of his wooded areas. The division of forest investigations makes studies on the growth, distribution, and habits of trees, forest problems in connection with fires, grazing, tree planting, stream flow, and erosion. The division of records has charge of the ordinary routine of the offices, charge of the library, and the preparation of the large and rapidly growing collection of photographs of forest scenes and objects. To this collection more than 6,000 were added during 1901. The Bureau of Forestry is now called upon to give advice and assistance in the management of nearly 50,000,000 acres of national, state, and private forests. During 1901, 38 applications were made by private owners for assistance in the management of 288,555 acres of forest. Detailed working plans were prepared for four private tracts as follows: 100,000 acres of short-leaf and loblolly pine in Arkansas, belonging to the Sawyer and Austin Lumber Company; 52,000 acres of hardwood forest, belonging to the Deering Harvester Company in Missouri; 1,600 acres of second growth hardwood forest, belonging to Hon. W. C. Whitney in Massachusetts; and 60,000 acres of spruce land in the Adirondack range, belonging to W. G. Rockefeller. Work has been begun on working plans for other tracts which embrace 628,000 acres in Maine, New York, Tennessee, and other States. There are now four tracts in the Adirondacks to which scientific forestry is applied, under the supervision of the bureau. These areas embrace 156,470 acres, more than 10,000 of which were added during 1901.

As rapidly as possible the Bureau of Forestry is preparing plans for the management of the national forest reserves. The field work necessary to working plans for the Black Hills reserve has been completed, and examinations begun of the Prescott, Big Horn, and Priest River reserves. The division of forest investigations began or has continued studies of the redwood, red fir, western hemlock, western yellow pine, big tree groves, long leaf pine, balsam, white ash, hickory, and several species of oak. Monographic studies of the red cedar, white cedar, and bald cypress have been completed, and that on the red cedar by Dr. Charles Mohr was published as Bulletin 32 of the Division of Forestry. Dr. Mohr, who died July 17, 1901, left completed studies of eleven of the more important oaks. In cooperation with the United States Geological Survey, an examination was made under authority from Congress of the region of the proposed Appalachian Forest Reserve. The area of the proposed reserve embraces about 9,600,000 acres in the lower part of the Appalachian mountain system. The investigation was made by the specific authorization of Congress, and a report will be presented on its suitability as a forest reserve and the probable benefit accruing from its careful and conservative management. In anticipation of this report there have already been introduced in Congress

a number of bills to establish the reserve. The study of the effect of grazing and fires was continued in twelve of the national forest reserves during 1901. Applications were received from 148 individuals for assistance in forest planting and examinations were made of 46,145 acres and detailed plans prepared for 5,785 acres, the most of which is to be planted in small tracts. Several applications have been made for planting plans for tracts of 5,000 acres or more. In the tree-planting investigations the bureau furnishes the plans and advice, the owner paying for all materials and labor. Studies were begun in Nebraska to determine the possibility of reclaiming portions of non-agricultural lands on the Great Plains by judicious planting and by protection from fire and grazing. These regions were hitherto believed to be beyond the limits of tree growth, yet the studies so far conducted show the practicability of silviculture over large areas of that country. The studies of the forests of Texas have been completed and an elaborate report upon them will soon be published. The appropriations for the Bureau of Forestry for the fiscal year ending June 30, 1902, are \$187,240, and for the previous year they were \$88,520, an increase of more than 110 per cent.

The Department of the Interior.—The work of this department relating to forestry is readily divided into the administrative work under the commissioner of the Land Office and the surveying, mapping, and describing of the reserves by the Geological Survey. Since the close of the fiscal year ending June 30, 1900, three new forest reserves have been created by presidential proclamation: the Crow Creek Forest Reserve in Wyoming, October 10, 1900; Wichita Forest Reserve in Oklahoma, July 4, 1901; and the Payson Forest Reserve in Utah, August 3, 1901. By executive order 46,080 acres were eliminated from the Cascade Forest Reserve in Oregon and 142,080 added to it, making a net increase in the size of the reserve of 96,000 acres. Other forest reserves were reduced in size by executive orders during 1901, as follows: Washington Forest Reserve in Washington, Big Horn Reserve in Wyoming, and the Olympic Reserve in Washington. There are now 41 national forest reserves, embracing over 46,000,000 acres. Temporary withdrawals have been made of various portions of the public domain pending the consideration of the advisability of making them permanent, as follows: Proposed Elkhorn reserve in Montana, Salt Lake reserve in Utah, Las Animas reserve in Colorado, Tooele reserve in Utah, and Elk Creek reserve in Oregon.

In order to care better for the forests and to adjudicate more promptly matters appertaining to them, a partial reorganization has been effected by the secretary of the interior, of the forestry division of the General Land Office. Mr. Filibert Roth, formerly of the Division of Forestry of the Department of Agriculture and later of the Cornell School of Forestry, has been placed in charge of the division. It is hoped by a better supervision of the forest inspectors and rangers that there will be less loss from fires and the stealing of timber. The sale of mature timber from the reserves is to be encouraged, and after January 1, 1902, timber killed by fire will be sold at the same rate as green timber. In this way it is believed possible to prevent intentional starting of forest fires to secure dead and down timber at reduced prices. Field operations on the part of inspectors, rangers, and others is to be made of prime importance and administration through reports from reserves is to be secondary. The police patrol is to be made as efficient as possible to prevent fires and stealing. Forest fires in Washington, Oregon, Colorado, etc., were unusually destructive during 1901. Depredations on public timber during the year were reported in 548 cases, amounting to \$1,464,000, and action was begun to collect damages and punish the criminals. In his report to the President the secretary of the interior recommends, that if it is found practicable, the administration of the forest reserves be turned over to the Department of Agriculture, the Bureau of Forestry of which is already equipped with an efficient corps of trained foresters. The forestry work of the Geological Survey has been along lines similar to those pursued for a number of years. The investigation of the forest reserves has been continued and their condition is now better understood. The investigation and mapping of the proposed new reserves has occupied considerable time, but the details cannot be presented, as the report has not yet been issued.

Forestry in the Philippines.—During the Spanish régime a sort of state control was exercised over the forest domain of the islands. After American authority was assumed the forestry bureau was reorganized and placed upon a permanent basis. This bureau is now attached to the Department of the Interior of the insular government, and is provided with a chief, assistant chief, inspectors, foresters, rangers, etc., to the number of about eighty. A license is now required to cut timber on public lands, and a fixed price per cubic foot of timber cut is demanded. The timber of the islands has been classified into six groups, and for the privilege of cutting the lumberman is required to pay 1, 2, 3, 8, 10, and 14 cents per cubic foot, dependent upon which group is cut. Only timbers of the three cheapest kinds may be cut for fuel. The public domain of forest is estimated at between 20,000,000

and 40,000,000 acres; but while the islands are densely wooded, no extensive tracts of pure forest of single species are known, and lumbering for a particular kind will be expensive and difficult. The revenue received during the first year of American management netted a decided increase over that previously reported, and it has been estimated that under scientific management a revenue of \$1,000,000 may be annually secured. The white ants or termites are a source of much timber destruction in the islands, and on account of them care must be exercised in selecting structural timbers. An experiment conducted for a short time only seemed to indicate that white cedar, hemlock, and redwood from the Pacific Coast States were nearly or entirely exempt from their attacks. A report on *Some Important Timber Trees of the Philippines* has been recently issued by Capt. G. P. Ahern, chief of the insular Bureau of Forestry. See PHILIPPINES (paragraph Forests and Timber Products).

State Forestry.—Important advance has been made in a number of States along lines of forestry. Pennsylvania has established a Department of Forestry, with Dr. J. T. Rothrock as commissioner. The department is given authority to acquire lands for timber reserves and is given control of all such State property, which now amounts to 324,000 acres, of which 30,000 acres are in an almost solid body and protect the headwaters of a number of streams which empty into the Delaware River. In Connecticut the legislature has provided the beginning of forest improvement and extension. In connection with the Board of Control of the State Experiment Station, a forester has been appointed and an appropriation was made to begin experiments in the reforestation of barren lands with oak, pine, and chestnut, the lands to become State parks. The legislature of Indiana has authorized the appointment of a State Board of Forestry and has reduced to a nominal sum the taxes upon lands devoted exclusively to forest purposes. Michigan has placed 100,000 acres of public domain to the use of its Forest Commission. In Minnesota non-agricultural lands reverting to the State through delinquent taxes are set aside as forest reserves. California has appropriated \$260,000 to purchase a redwood reserve in the Santa Cruz mountains as a State park. The legislatures of all of the States in which parts of the proposed Appalachian Forest Reserve are located have passed laws exempting such lands from taxation and have permitted the passing of title of all lands acquired for the purposes of the park. The town of Brunswick, Me., has the distinction of being the first municipality in the United States to engage actively in forest planting. A tract of 100 acres belonging to the town will be planted to white pine. The land is now wholly unproductive, but it is hoped that it will become revenue producing, as is the case of many municipal forests in Europe. A majority of the States have laws which relate to forest fires. In several these have been amended recently to make them more effective, but the difficulty of enforcement annuls most of them.

Forest Associations, Schools, etc.—The summer meeting of the American Forestry Association was held at Denver, Col., August 27-29, 1901, with a large attendance. Numerous papers of interest were presented and illustrated lectures were delivered by Mr. Gifford Pinchot on *The Government and the Forest Preserves*, and by Mr. F. H. Newell on *Forests and Irrigation*. The twentieth annual meeting of the association was held at Washington, D. C., on December 11, 1901, Hon. James Wilson, secretary of agriculture, was reelected president. An international Society of Arboriculture was organized at Connersville, Ind., in June, with delegates from thirty-seven States and many foreign countries. A forest association was organized in Tennessee in August, and it held its first general meeting at Nashville in November. A Society for the Protection of New Hampshire Forests was organized during 1901. A Park and Forest Association was organized at Des Moines, Ia., which will urge the appointment of a State Commission. The Massachusetts Forest Association held its fourth annual meeting in Boston in December. The successful efforts of the association in preventing the despoliation of the Blue Hill reservation was reported and measures looking towards the preservation of Greylock Mountain were announced. The Minnesota Forest Association met in Minneapolis in December, when a resolution was adopted pledging the organization to use its best endeavors to secure a national forest reserve in Minnesota to protect the headwaters of the Mississippi River. There are now said to be twenty-two national and State forest associations in the United States.

The Forestry Schools of the country report a successful year's work and increased attendance. At the New York State College of Forestry, which is affiliated with Cornell University, 38 students were enrolled against 17 in 1900. The Yale Forestry School reports an enrollment of 31 students and 11 students are matriculated at the Biltmore School of Forestry. The New York institution will hereafter grant its graduates the degree of Forest Engineer instead of Bachelor of the Science of Forestry. The Yale School held a very successful summer school at Milford, Pa., where courses of instruction were given those who did not wish to take the longer courses at the regular school. Agitation

has been begun for the establishment of schools of forestry in connection with the University of Minnesota and the State College of Pennsylvania. Some degree of instruction in forestry is now given at more than fifty of our agricultural colleges and other educational institutions. See LANDS, PUBLIC.

FORMALDEHYDE. See FOOD.

FORMOSA, an island belonging to Japan, in the Pacific Ocean, lies 100 miles off the coast of China, and 250 miles north of the Philippines. It has an area of 13,458 square miles, and a population, according to the census of December 31, 1898, of 2,690,096, the larger part of whom are Chinese. The seat of government is at Taipei. The island is very mountainous. The interior, inhabited by an uncivilized race of Malays, is almost inaccessible. The largest city is Tainan, other towns of importance being Tamsui and Auping. Since its acquisition by Japan in 1898 the island has been under military rule. The administration is in charge of a governor-general and magistrates for each of the six districts into which the island is divided. The Pescadores, a small group of islands off the western coast, are attached to Formosa for administrative purposes. The budget of 1901 for Formosa balanced at 22,126,483 yen (the yen is worth 49.8 cents). The Japanese government furnished a subsidy of 8,998,000 yen, and over 9,000,000 yen were received from government monopolies, of which the camphor monopoly is the most valuable. The island produces tea, coal, camphor, sugar, rice, indigo, and fruits. The total exports, exclusive of the trade with Japan, amounted in 1899 to 11,092,623 yen, and the imports to 14,273,094 yen. The export trade is largely with China (8,692,467 yen in 1899), with Hong Kong, whence transshipment is made to Europe, and with the United States. The value of the principal items of export in 1899 were: Black tea, 5,295,796 yen; camphor, in the production of which Formosa leads the world, 1,732,740 yen; rice, 1,265,727 yen, and sugar, 1,586,945 yen. There are two railway lines, one connecting Takow and Kelung and the other Tainan and Taipei.

FORSHELL, HANS LUDWIG, Swedish statesman, died at San Bernardino, Switzerland, August 2, 1901. He was born at Gräsle, Sweden, in 1843, and entered the University of Upsala in 1859, where he became in 1866 doctor of philosophy and docent of history. In 1874 he was chosen secretary of the National Bank of Sweden, and a year later was made minister of finance. Resigning from this post in 1880, in consequence of a disagreement with the Swedish premier, he became president of the board in control of the public domain. For some years preceding 1897 he was a member of the Swedish Chamber, and took an active part in the discussion of public affairs.

FOSSIL BOTANY. Text-books on this subject are much needed, and it is pleasing to record the appearance of a new one, namely, *Studies in Fossil Botany*, by D. H. Scott (London, 1900). Among the recently published papers on this subject may be mentioned the *Stratigraphical Succession of the Fossil Floras of the Pottsville Formation in the Southern Anthracite Coal-fields*, by David White, United States Geological Survey, *Twentieth Annual Report*, pt. 2, pp. 749-930; *A Study of Some American Fossil Cycads*, by G. R. Wieland, pt. iv., *American Journal of Science*, June, 1901, p. 423.

FOSTER, L. L., American educator, died at Dallas, Tex., December 2, 1901. He was born in Georgia in 1853, and went to Texas in 1867. Self-educated, he was engaged for a time in journalistic work, and later went into State politics. He served three terms in the legislature of Texas, once as speaker, and later was appointed commissioner of insurance statistics and history. In 1898 he was manager of Governor Sayer's campaign, and in the same year was made president of the Texas Agricultural and Mechanical College.

FOUNTAINS, ELECTRIC. See ELECTRIC LIGHT AND POWER.

FOUQUIER, JACQUES FRANÇOIS HENRI, French journalist, died in Paris, December 25, 1901. He was born at Marseilles, September 1, 1838, and studied both law and medicine, without however taking a degree in either. In 1861, after some years of travel in Spain and Italy and a course of study in Italian art, he went to Paris, where he engaged in journalism. As special correspondent he was with Garibaldi in the campaign of 1867, and in 1870 he was sent on a government mission to Marseilles, where he founded, with M. Labadie, *La Vraie République*. After holding the posts of secretary of the department and prefect, he returned to Paris and was appointed press censor in the interior department. In 1885 he was first elected to the Chamber of Deputies, and was reelected in 1889. He published a number of volumes on art and literature, including: *Etudes Artistiques* (1859); *l'Art Officiel et la Liberté* (1861); *Au Siècle Dernier* (1884); *La Sagesse Parisienne* (1885); and, with M. Ranc, a five-act drama, *Le Roman d'une Conspiration* (1890).

FRANCE, a republic of western Europe lying between the Atlantic Ocean on the west and Germany on the east. The capital is Paris.

Area and Population.—The area, including Corsica (3,377 square miles), is placed at 204,092 square miles. The census returns for 1901, published in June, show the population to be 38,641,333, an increase since 1896 of only 123,358. The increase of Paris and its suburbs slightly exceeds this small increase, so that the population of the rest of France actually declined. And the greater part of the increase in Paris was due to foreign immigration. The population of the principal cities has undergone the following changes: Paris has increased from 2,536,824 in 1896 to 2,660,559 in 1901; Marseilles from 442,239 to 494,769; Lyons from 446,428 to 453,145; Bordeaux from 256,906 to 257,471; Lille has declined from 216,976 to 215,431, and Toulouse from 149,963 to 147,696. Since 1850 the population of France, allowing for alterations of boundaries, has increased only from 35,000,000 to 38,641,000, whereas that of Great Britain has risen from 27,000,000 to 41,000,000; Germany, from 35,000,000 to 56,000,000; Austria-Hungary, from 30,000,000 to 45,000,000; Italy from 23,000,000 to 32,000,000, and Russia (partly owing to annexations), from 66,000,000 to 128,000,000. France has been long preoccupied with the question of depopulation, which, it seems to be admitted, is largely caused by social conditions. One of these conditions is the disinclination to marriage, and another and more potent one is the reduction in the size of the families. "Families having only one child, or at the most two children, are becoming in the country as in the towns an almost universal rule." No one wants to marry a girl unless she has a dot or dowry and is able after marriage to meet her own expenses. A father seems to think it necessary to provide for all his children; that is, to lay up a sum to support his daughter during life, and also, if possible, for his son. In the country there is an endless subdivision of land, a father parceling and reparceling his own small patrimony so as to make room for his children on the same plot. In other words, there is too much frugality and altogether too little initiative and independence.

Frenchmen are probably most concerned with the comparison between the population of France and that of Germany, since, in days of universal conscription, the balance of numbers on either side of a land frontier becomes of immense importance. The German census of 1900 gave a population exceeding 56,000,000, a number practically half as large again as that of France. France stands alone among the great nations of Europe in slowness of numerical increase. In contradistinction to the general apprehension with which the "depopulation" of France is regarded by most serious men, a view has been advanced in some quarters that has the merit of novelty, if not of perfect soundness, and contains, too, a good deal of truth. This looks upon the failure of the French people to increase more in the nature of a good than a calamity, and points out that a teeming population is not an unredeemed blessing, if with it comes want, lack of employment, and overcrowding, as is the case with Great Britain and Italy; as one Frenchman wittily remarked, "Germany has doubled its population within the last 50 years and is now in the throes of a famine." Certain it is that France in a great measure has been spared such industrial crises as have visited all the other European countries at various times during the last decade.

Religion and Instruction.—No religious census is taken in France. The government contributes to the maintenance of all forms of public worship having a considerable number of adherents. In 1901 the government contribution, divided in proportion to numerical strength, was 41,158,923 francs to Roman Catholics, 1,495,100 to Protestants, and 206,530 to Jews. Primary and secondary education is partly in the hands of the state and partly under the control of various Catholic organizations. For the relation of the question of public instruction to the Catholic congregations, see paragraph Associations Bill, under History. In 1899 the public schools were attended by 4,159,576 children, of whom 3,814,676 attended the lay schools and 354,902 the clerical schools. The number of children enrolled in private schools during the same year was 1,369,721, of whom more than 90 per cent. attended Catholic schools. Secondary education is provided for by state institutions known as lycées and by communal colleges, to the latter of which the state also contributes in part. In 1899 the number of lycées for boys was 110, with an attendance of 51,997, and the number of communal colleges was 229, with an enrollment of 32,510. In private institutions at the same time, secondary instruction was imparted to 79,007 boys, of whom more than 85 per cent. attended the ecclesiastical schools. In 1899 the number of girls enrolled in the various secondary institutions was 16,233. The universities of France afford instruction in letters, theology, science, law, medicine, and pharmacy. In 1901 the number of students in the state universities was 29,901. The enrollment in the principal universities was: Paris, 12,289 (the largest in the world); Lyons, 2,458; Bordeaux, 2,119, and Toulouse, 2,040.

Government.—France has been under a republican form of government since the fall of Napoleon III. (September 4, 1870). The present constitution was adopted in 1875 and has been repeatedly amended since that time. The legislative power is vested in a Senate and a Chamber of Deputies, and the executive authority is exercised by a president. The Chamber of Deputies is composed of 584 members, elected

by universal suffrage for a period of four years: The various departments of France are divided for electoral purposes into *arrondissements*, of which each chooses one deputy. The senators, who hold office for nine years, are 300 in number and are elected by the general municipal and district councils of each department, together with the deputies and senators from that department. One-third of the Senate is retired every three years. There are at present 16 life senators, selected by the National Assembly of 1875. The two houses in joint session elect the president of the republic. He holds office for seven years and is aided in the performance of his duties by a council of ministers responsible to the lower Chamber. For purposes of local administration the country is divided into 87 departments, governed by prefects. The unit of municipal government is the commune. The president in power during 1901 was M. Emile Loubet, elected February 18, 1899. The premier and minister of the interior was M. Waldeck-Rousseau. Other leading members of the cabinet were M. Delcassé, the foreign minister, and M. Millerand, minister of commerce, industry, posts, and telegraphs. The legal system is based on the Code Napoléon. The courts of first instance are the justices of the peace and police magistrates for the trial of petty offenses, and correctional tribunals for more serious cases of misdemeanor. There are courts of assizes, with a jury, for the trial of criminal offenses. Tribunals of second instance are the 26 courts of appeal for the review of criminal trials, conducted without a jury. The Court of Cassation is the court of last resort. Its jurisdiction, however, is limited only to questions of law. It also listens to appeals from the jury courts of assize.

Army.—The French army, which is based on conscription, is the third in size among the European nations, that of Russia ranking first and Germany second. Every male citizen between the ages of 20 and 45 is liable to military duty, the terms of service being 3 years in the active army, 10 years in the reserve, 6 years in the territorial army, and 6 years in the territorial reserve. The land forces are subdivided into 20 *corps d'armée*, each of which is a complete organization with respect to the different arms of the service—infantry, cavalry, artillery, engineers, and train. In addition to the regular forces, the troops of the military department of Paris and the *gendarmérie* are liable to service in time of war. In 1901 the peace strength of the army was 27,044 officers and 494,469 men in France, and 2,946 officers and 74,806 men in Algeria and Tunis.

Navy.—The French navy ranks next after that of Great Britain, for simultaneously with the development of her colonial policy France has fostered the growth of her fleet. On February 1, 1901, the strength of the French fleet was as follows: Battleships of the first class, 5, with 3 building, and 3 projected; battleships of the second class, 7; and battleships of the third class, 13. The number of armored cruisers was 13, with 6 building and 5 projected, and the number of protected cruisers was 40. There were also 15 torpedo gunboats, 11 destroyers, with 4 building and 8 projected; and 176 torpedo boats of different classes. On the same date there were 10 submarine boats in commission, 4 building and 10 planned. As may be seen, the French navy is especially strong in torpedo boats, upon which great reliance is placed in the matter of coast defense. France also takes the lead in the construction of submarine craft, based upon different models. So far they have proved quite satisfactory. On October 26, 1901, the *Léon Gambetta*, a first-class battleship of 12,500 tons, was launched at Brest. Early in the year orders were placed for the *Victor Hugo*, a sister ship to the *Gambetta*. Twenty-eight destroyers and 11 first-class torpedo boats were planned for the immediate future. In 1898 the naval establishment numbered 1,733 officers and 40,589 men.

Finance.—The revenue is derived from direct taxation (lands, buildings, furniture, doors, windows, and patents) and indirect taxation (customs, monopolies, and state enterprises). In 1899 the revenue amounted to 3,496,863,520 francs. In 1900, according to the budget officially adopted, the revenue was 3,547,932,981 francs. For 1901 the estimates were 3,551,570,497 francs. The chief items of expenditure are the public debt, war, navy, instruction and fine art, public works, posts and telegraphs, and colonies. The preliminary budget for 1902 showed an increased expenditure of 43,000,000 francs, which is only partially counterbalanced by an increase of 35,000,000 francs in the revenue. In 1901 the receipts from customs showed an unexpected decline, and during the first nine months of the year the income fell 80,000,000 francs below the estimate. The most important attempt at financial legislation of 1901 was a bill passed by the Chamber on February 22, greatly increasing the scale of duties in the inheritance tax. The bill, though rejected by the Senate, is interesting as illustrating the growing tendency in France to impose heavy burdens upon capital. The proposed measure provided for an increase of one-twelfth in the tax on all legacies above one million francs. Between five and ten millions the increase was by one-eighth; between ten and twenty millions, by one-half; between twenty and one hundred millions, double the existing tax, and over one hundred millions, three times. The full severity of the measure will be appreciated if the existing scale of taxation be considered. At present the law imposes a tax of 1 per cent.

FRENCH STATESMEN —President Loubet (upper left corner), Delcassé (upper right),
Waldeck-Rousseau (lower left), Deschanel (lower right).

on all legacies in the direct line above 2,000 francs; $1\frac{1}{2}$ per cent. on amounts from 10,000 to 50,000; 2 per cent. from 100,000 to 250,000; and $2\frac{1}{2}$ per cent. above that sum. Upon legacies from husband to wife the duty ranges from $3\frac{1}{2}$ to 7 per cent.; from brother to sister, $8\frac{3}{4}$ to 12 per cent.; from uncle or aunt to nephew, 10 to $13\frac{1}{2}$ per cent.; and between strangers in blood from 15 to $18\frac{1}{2}$ per cent. Under the new measure in some extreme cases the tax would have risen as high as 64 per cent., which, as remarked in France at the time, practically amounted to confiscation. There was also considerable discussion during the year of increasing the income tax, partly to meet the exigencies of the growing budget and partly to make up for the loss from certain direct contributions which it was proposed to abolish.

Agriculture.—The principal cereal crops, in the order of their importance, are wheat, oats, barley, rye, buckwheat, and maize. The mulberry is extensively cultivated, and beets, olives, and cider apples are raised to a very considerable amount. In the production of wine France leads the world. In 1899 more than 91,000,000 acres, or about 70 per cent. of the total area of France, was under crops and grass. In that year the yield of the various cereals in hectolitres (one hectolitre equals 2.838 bushels) was: Wheat, 128,418,920; oats, 95,301,320; barley, 15,965,790; rye, 23,577,000; buckwheat, 8,106,430; maize, 9,002,990. The production of wine amounted to 46,810,000 hectolitres (one hectolitre equals 26.417 gallons), and the production of silk cocoons to 6,993,339 kilogrammes (one kilogramme equals 2.2046 pounds). A closely approximated estimate placed the wheat crop of 1900 at 128,217,000 hectolitres, and the rye crop at 23,676,000 hectolitres. The production of wine in the same year was extraordinarily large, amounting to 67,352,661 hectolitres—an increase of nearly 21,000,000 hectolitres over the preceding year, and of more than 31,000,000 hectolitres over the average annual production for the last ten years. The yield has been exceeded only three times during the last one hundred years. That this enormous increase was due almost entirely to favorable conditions of sun and weather, and only in a very small degree to an increase in the extent of area under cultivation, is shown by the fact that the average yield per hectare was 39 hectolitres as against 28 hectolitres in 1899. For 1901 partial figures pointed to a return to normal production, though still showing a very full yield, amounting probably to 55,000,000 hectolitres. The prospects of the wheat crop for 1901 were exceptionally discouraging. At the highest estimate the yield was placed at 108,000,000 hectolitres, a decline of 15 per cent. from 1900, and it was thought not improbable that it might fall as low as 90,000,000 hectolitres, necessitating the importation of 35,000,000 hectolitres from abroad. An interesting feature of agricultural development in France is the high degree to which the organization of both farm laborers and employers into unions has been carried. These unions, or "syndicates," are corporations established by law, and authorized to own such property as is necessary for their meetings, libraries, and lecture rooms. They may establish banks for the safekeeping of pension funds, and tribunals for the settlement of disputes among the workingmen or between the employers and wage-earners. The number of these syndicates in 1900 was 7,089, with a membership of 1,192,260; of these, 2,157 were syndicates of large landowners, 2,685 of workingmen, 170 of employers and workingmen mixed, and 2,607 of small farmers, the latter aggregating 572,794. The syndicates are combined into territorial unions, of which there are ten in France. The advantages arising from such unions, as pointed out by the United States consul at Lyons, are twofold: materially they make possible "the buying of fertilizers and implements at wholesale prices; the securing of cheap transportation; the sale of products in the best markets" and at the most advantageous times. Politically the farmers' syndicates, though free from all partisan spirit, are able to influence in large measure all legislation affecting the interests of the agricultural classes. Probably more important than either of these advantages is the fact that the unions have served to bring employers and wage-earners into harmonious relations. "In the union of the southeast," with headquarters at Lyons, "out of 61,282 members, 7,808 are capitalists—men who can, if they please, live on their incomes—while the 53,474 are employees or small farmers. The poorer classes seek the advice and cooperation of capitalists, bankers, and any other successful business men."

Minerals.—The two principal minerals produced in France are coal and iron, though silver, lead, zinc, manganese, and antimony are also found. In 1899 the output of coal and lignite was 32,933,780 tons; pig iron, 2,567,388 tons; wrought iron, 842,755 tons; steel, 1,259,701 tons. In 1900 the production of coal was placed at 33,270,385 tons; pig iron, 2,699,494 tons; wrought iron, 745,312 tons; and steel, 1,264,737 tons. The annual consumption of coal is about 42,000,000 tons, necessitating the importation of some 10,000,000 tons from England, and to a smaller extent from the United States. In 1899 there were 11,658,919 tons imported; in 1900 the amount rose to 14,335,740 tons. In 1897 the number of men employed in the mines was 156,504.

Commerce and Manufactures.—Under the head of general commerce is included the total volume of exports and imports; under the head of special commerce all commodities of export produced in the country and all imports consumed there. The principal articles of export are woollen, silk, and cotton tissues, wine, manufactured articles, robes, confectionery, and artificial flowers. The chief commodities imported are raw wool, cotton and silk, foodstuff, machinery, metal, oils, and timber. In 1899 the special exports were valued at 3,899,142,000 francs and the imports at 4,217,000,000 francs. In 1900 the special exports amounted to 4,078,032,000 francs and the special imports 4,408,530,000. Of the imports the value of the foodstuffs amounted to 828,921,000 francs; manufactured articles, 841,430,000 francs; and raw materials, 2,738,179,000 francs. The exports were divided as follows: Foodstuffs, 776,378,000 francs; manufactured articles, 1,995,862,000 francs; raw materials, 1,090,375,000 francs. It will be seen that in the matter of foodstuffs the exports and imports nearly balance, with a slight excess in favor of the latter; generally the difference between the two is more marked, as in the matter of cereals the country is not self-supporting, but the tendency has lately been towards a decrease in the excess of imports over exports. In the case of raw materials and manufactured articles it is evident that in the matter of exports and imports they are related to each other in inverse ratio. In 1900, that is, the raw material exported amounted to 40 per cent. of the raw material *imported*; at the same time the manufactures *imported* were equal to a little over 42 per cent. of the manufactures exported. Evidently, then, the mass of raw material brought into the country is sent back in the form of tissues and manufactured articles. This is especially true of woollens, silk and cotton textiles, and of leather goods. The part contributed by the leading nations to the special commerce of France is approximately as follows: In imports—Great Britain, 13 per cent.; the United States, 10 per cent.; Germany, 8 per cent.; Belgium, 7 per cent.; Spain, 6 per cent.; Argentine Republic, 6 per cent.; Algeria, 6 per cent.; British India, $5\frac{1}{2}$ per cent.; Russia, 5 per cent.; Italy, 4 per cent. In exports—Great Britain, 30 per cent.; Belgium, 15 per cent.; Germany, $8\frac{1}{2}$ per cent.; Algeria, $6\frac{3}{4}$ per cent.; the United States, 9 per cent.; Switzerland, $5\frac{1}{2}$ per cent.; Italy, $4\frac{1}{2}$ per cent.; Spain, 3 per cent. In 1900 the imports from the United States were \$82,553,335 and the exports to the United States, \$72,181,212. The principal ports of the country share in the foreign trade in the following proportion: Marseilles, about one-fifth; Havre, one-sixth; Paris, 7 per cent.; Bordeaux, $6\frac{1}{2}$ per cent.; Dunkirk, 6 per cent.; Boulogne, $4\frac{1}{2}$ per cent. According to the census of 1896 there were 52,971 industrial establishments. Of these the agricultural works (mills, wine and cider presses, etc.) numbered 15,329; food establishments, 9,141; building, 6,922; textiles, 6,627; metals, 4,926. The sugar industry in 1898 employed 42,607 men, 3,577 women, and 2,427 children.

Shipping.—In the fall of 1900 the merchant marine of France, which ranks fifth after that of Great Britain, Germany, the United States, and Norway, was estimated at 1,401,000 tons, of which 1,060,000 tons were in steam bottoms and 3410,000 in sailing vessels. In 1898 the entries in French ports were 82,094 vessels of 11,907,268 tons sailing under the French flag, and 20,965 vessels of 11,950,683 tons under foreign flags; the clearances were 82,585 French ships of 12,220,972 tons and 21,291 foreign ships of 12,076,343 tons. In 1899 the number of French ships entered was 80,135, with a tonnage of 12,167,655, and the number of foreign bottoms 21,055, with a tonnage of 12,743,851. The clearances were 80,556 French vessels of 12,369,276 tons and 21,308 foreign vessels of 12,811,684 tons. By comparison with other maritime nations the merchant fleet of France has grown very little. This in great measure is due to the unwise policy of fostering the building of sailing vessels at the expense of steamers. At present the annual ship subsidy granted by the government amounts to 26,000,000 francs, and before 1909 it will rise as high as 60,000,000 francs. As a result, French ships, which between 1880 and 1890 carried 30 per cent. of the country's trade, now carry only 20 per cent. The question of a new subsidy law to supersede the act of 1893 now in force was discussed at great length during 1901, and action on the part of the chamber was repeatedly urged by M. Millerand, the minister of commerce. It was proposed radically to alter the provision of the law so as to encourage the building of steam vessels, but powerful interests were opposed to such a measure, and at the end of the year the question was still a mooted one.

Communications.—In 1899 there were 30,775 miles of roads over 40 feet wide connecting all the principal cities. There are 5,500 miles of navigable rivers and 2,970 miles of canals. The railways were built under concessions from the government, which guarantees the interest on the bonds. Ultimately they are all to come into the possession of the state, which at present owns one of the six main lines. In 1899 the length of the railway lines in operation was 23,375 miles, with gross receipts amounting to 1,475,000,000 francs and a net profit of 694,300,000 francs. In 1900 the number of miles had increased to 23,600, the receipts to 1,578,300,000

francs, and the profits to 695,100,000 francs. In 1899 there were 79,396 miles of telegraph, and in 1898 23,352 miles of telephone.

HISTORY.

The Cabinet.—On June 22, 1901, the Waldeck-Rousseau ministry completed the second year of its existence with its position seemingly more assured and its prestige at a higher point than at any time during its entire tenure of office. No other cabinet since the Franco-Prussian War has remained so long in power, or, retaining power, has succeeded in carrying out so aggressive a policy at times of acute national crisis and in the face of a militant parliamentary opposition and a hostile press. On the same day that it entered upon its third year of office, the ministry achieved the greatest triumph of its career in securing the passage through the Senate of the much discussed Associations Bill. More than any other measure fathered by the government, the law of associations emphasized the heterogeneous composition of the ministry and the radical influences to which at times it seemed entirely to yield. A rather unusual spectacle is afforded by a cabinet composed of *bourgeois* representatives and the leaders of a revolutionary party working in harmony on the basis of constant and mutual concession. These two elements, in spite of the laws of political probability and the predictions of political prophets, have obstinately failed to prove the ruin of the cabinet, and have become in fact the main sources of its strength. Anomalous, too, is the condition presented by a country like France, in which capitalism has developed to a great degree, governed by a ministry which seems to be guided by men whose principles of political economy are entirely subversive of existing things. Yet it is a fact that under the administration of Waldeck-Rousseau the country has prospered, for notwithstanding the great amount of discussion concerning the depopulation of France and the blighting of its industries by the aggressive conduct of the French workmen and paternal legislation on the part of the government, the surest test of national strength, the public credit, would seem to indicate that at present both the state and the people of France are in no financial straits. In October, 1901, a loan of 65,000,000 francs, voted to defray the costs of the Chinese expedition, was over-subscribed twenty-five times within the country. That the majority of the nation has rallied to the support of the party in power was evidenced both in parliament and without during 1901. Early in March the Chamber, by a vote of 346 to 117, expelled the National leaders, MM. Déroulède and Marcel-Habert, and in the by-election that followed M. Déroulède's seat was won by the supporters of the ministry. In the elections for members of the departmental councils, which took place in the latter part of July, the Republicans gained 47 seats, and in the elections for the *conseils d'arrondissement*, which occurred at the same time, the Republicans won 67 seats. Proportionate gains were made by the Radicals and Socialists, so that in the total the position of the government party throughout the country was greatly strengthened.

Associations Bill.—The passage by the Chamber of Deputies, on June 28, 1901, of the associations bill marked an important incident in the long war waged in France against monastic principles and the interference, overt or hidden, of the Catholic orders in matters of state. The immediate cause of the associations bill was the position taken early in 1900 by *La Croix*, the organ of the Assumptionist monks. This paper, in supporting the candidacy of General Mercier, a Nationalist, for the Senate, abused the existing Republican government without stint. In return the government dissolved the order of the Assumptionists, which still further inflamed the clergy, and brought the whole matter to a direct and unavoidable issue. The government then determined upon further retributive measures. In an able speech at Toulouse, on October 28, 1900, M. Waldeck-Rousseau, the premier, said that excluding personality the religious orders in France were worth 1,069,000,000 francs in landed property held in mortmain. This wealth gave them great power, the more so as they conserved their ready cash by evasion of taxes. But the power so gained was employed to plot directly against the government, although it was evident that ecclesiastics who were "functionaries and stipendiaries" of the government were bound in honor and morality to preserve a decent respect for it. Moreover, the schools of the orders were used to breed up within the state a faction against the state; the pupils were trained in loyalty to the church alone; and history and fact were presented by the church for its own aims. Therefore, in order to preserve the independence of the republic, it was necessary for the ministry to introduce measures curbing the power of the orders and to insist upon these measures as a supreme political issue by which the ministry would stand or fall. One of these bills would direct that the qualifications for entrance to any special school of the state, or for appointment to any official state position, must include three years of preliminary study in a state school; the other bill would make direct governing laws and regulations for the religious associations. The second half of this programme, as embodied in the associations bill, passed the Chamber of

Deputies on March 29, 1901, by a vote of 303 to 220. It was then referred to the senate and passed on June 22, after amendment, by a vote of 173 to 99, and as amended was repassed by the deputies by a vote of 313 to 249.

Provisions of the Associations Bill.—According to the provisions of the associations bill, an "association" is constituted by an agreement between two or more persons to work together for a common end other than that of pecuniary profit. Such associations, by which are primarily meant religious organizations, are in general legalized by the bill and are placed "under the general principles of law applicable to contracts and obligations." But associations whose spirit is contrary to the laws, to the constitution, to public order, to morality, or whose statutes entail renunciation by their members of natural and individual rights, are to be declared null and void by the civil tribunal, either with the consent of all concerned or at the instance of the public prosecutor. Moreover, except by the express authorization of the government, there may not be formed, nor continued where already formed, any association either (1) between French subjects and foreigners, or (2) between Frenchmen and Frenchmen, if "the headquarters and directorate are located abroad or intrusted to foreigners." Members of an association not formed for a limited period are given the right to withdraw from it at any time and notwithstanding any rule of the association to the contrary. Associations which may be formed in the future must, on demand of the proper authority, declare their constitutions, statutes, and by-laws, and any modification of these made by associations already existing must also be declared. In case an association is dissolved by the state, specific bequests shall be returned to the donors or their heirs, and the state shall take over the residue of the property, except that provision shall be made for those members "who have no sure and regular mode of existence, or who can prove that they have contributed to the acquisition of the common riches of the order." This last clause, as appears upon its face, is intended to relieve that numerous class in the religious orders who entered young and poor, lost their taste and aptitude for gaining a livelihood in the outside world, and who, while totally dependent upon charity or their superiors for sustenance, have nevertheless, by their toil, devotion, and self-sacrifice, created a large amount of wealth belonging to the common order and described as "unclaimed."

Politically the passage of this bill was a defeat for the monarchists and reactionists, with whom the Catholic orders are rather closely allied. Directly, however, it was aimed against orders like the Jesuits, the Dominicans, the Carmelites, and the Capuchins, and constituted, in the opinion of the ministry, a declaration by France that she would maintain her independence and resist covert denationalization of her citizens. In a larger sense the bill seems to have been considered a protest against the international policy of the leaders of Catholicism. That policy has been frequently avowed to be the regaining of temporal power in Italy and the maintenance of temporal influence elsewhere, and particularly in the so-called Catholic countries of Europe. But France is the richest and most powerful of the Catholic countries, and shelters the greatest number of Catholic subjects. Moreover, owing to the position of France in European politics, Catholic prestige there is of extreme strategic value. Hence the special significance of the associations bill.

The Effect of the Law.—At the time of the passage of the associations bill there were in France 16,468 religious establishments, containing at a rough estimate some 400,000 members. Upon the great majority of such institutions the new law imposed no great hardships, for as a general rule the provisions of the act were intended not so much to effect a radical change in the constitution of the religious establishments as to give legal sanction to their prevailing organization and to bring them more closely under the control of the government. In placing all religious bodies under the jurisdiction of the bishops, the law, as generally interpreted, effected nothing new, since at all times religious communities owning no foreign affiliations had been subject to the supervision of the bishop in everything save the details of internal management. Neither was there any difficulty involved in the requirement that before authorization could be granted to any institution the consent of the municipal local authorities should be obtained; for though Radical and Socialistic communities might in some instances refuse their consent, as did happen at Lille, Avignon, Carmaux, and Auxerre, the government was in no manner bound by the action of the local authorities, and in any event such cases were very few. The mass of the French people had no ill-will for the religious congregations which constituted an important social element of the life of the nation, and in whose hands the education of the youth was largely vested. In many places the prosperity of the entire community was inseparably connected with some wealthy abbey or monastery; in a large number of the rural districts the congregations were the principal owners of the soil, and both as capitalists and desirable customers were assured of kindly treatment at the hands of the prudent *bourgeoisie*. When the bitterness of feeling aroused by the struggle over the bill had subsided in some measure, people began to recognize that the law had probably brought as

Disorder in Clergy

much good as evil to the congregations, and that what had been lost in freedom of action on the part of individual religious communities was compensated for by the security of title and possession lent by the provisions of the new enactment.

What has been said of the orders in general, however, was not true of those orders which stood under the control of some superior abroad. Against these, as has been stated, the regulations of the bill were evidently directed, and though it was possible in some degree to evade those regulations, they could not be openly defied. While the French congregations therefore reluctantly but steadily began to apply for official authorization, many of the foreign orders prepared to leave the country. The law had fixed October 3, as the last day upon which application for authorization might be made. By that time only 5,141 establishments had taken advantage of the act, but when the government proceeded promptly to appoint receivers to take possession of the property of the delinquent orders, the numbers of requests for authorization rose in one week to 8,800 and there it stopped. Among those who submitted to the provisions of the act were establishments belonging to the Franciscans, Dominicans, Capuchins, Trappists, Redemptionists, and the fathers of the Grande Chartreuse. The Jesuits, Assumptionists, Benedictines, and the Carmelites abandoned the country for Belgium, Luxemburg, Spain, Italy, and Great Britain. The Jesuit schools in Paris, however, were reopened under new teachers, and the work of instruction was continued practically on the same lines. Abroad the members of the recusant orders met with no gratifying welcome. In Belgium they were received with suspicion by their own brethren, who for their own protection hastened to impose numerous restrictions upon them. In Spain the fugitives were prevented from settling in the country by express decree of the government.

The French Socialists.—During the debate on the associations bill the opponents of the measure repeatedly asserted that the ministry had been actuated in its attack on the religious congregations by the desire to propitiate the extreme Radicals, and especially the Socialists, among its supporters. Though there was little truth in the charge upon the specific point, the influence exerted by the Socialist party on the course of the government in general was undoubtedly great during the year, and this in spite of the dissensions among the Socialists themselves. The conflict which had been going on for two years between the revolutionary wing of the party, led by Jules Guesde, and the Opportunistic or ministerial faction, under Jaurès, came no nearer a settlement in 1901, and it required all the skill of the Socialist leaders in parliament so to stretch the party conscience as to make the presence of a Socialist in a *bourgeois* cabinet seem righteous and reasonable. The national congress of Socialists, which assembled at Lyons on May 8, 1901, declared, by 910 voices against 286, that M. Millerand had not placed himself outside of the party by accepting office under Waldeck-Rousseau, but decided at the same time, by 904 votes to 42, that the presence of M. Millerand in the cabinet could not determine in any way the attitude of the Socialist party to the government, and that the action of the Socialist deputies must be guided entirely by the interests of the proletariat. To a large section of the party, however, juggling with moral principles was extremely obnoxious; the regular annual secession of the Guesdites, the Blanquistes, and other extreme factions occurred on May 31, and there was much talk of the formation of a new party based on the principles of revolutionary and uncompromising class struggle.

In parliament, however, the Socialist group remained practically compact, and was still able to dictate in a large measure the policy of the government. This was especially apparent in the mooted questions of labor legislation, which played a prominent part during the year. In the spring of 1901 there was a growing restlessness among the working classes all over the country. At Montceau-les-Mines the chronic strike of the miners was attaining formidable proportions. In Marseilles, during the latter part of March, 18,000 longshoremen and laborers quit work, and the strike was marked by frequent outbreaks of disorder which often necessitated the calling out of the police. The government was placed in a very embarrassing position by the action of the laboring classes. On the one hand there was the manifest duty of preserving law and order and guarding the interests of property; but there, too, was the danger of antagonizing by undue severity its radical supporters in the chamber. The aggressive conduct of the labor representatives served to increase the difficulties of the cabinet's position, as when, on March 16, the Miners' Union of Montceau-les-Mines requested the chamber to receive certain delegates of theirs and to listen to their account of the true state of affairs in the matter of the strike. Waldeck-Rousseau, with his usual *finesse* , managed to tread his way safely between the two parties and to pursue a policy conciliatory to both. The representatives of the Socialist classes were placated by such action on the part of the chamber as the voting of 100,000 francs for the support of the families of the strikers at Montceau-les-Mines; and though in the middle of April the prospects of a general strike seemed very imminent, the policy of the govern-

ment was so far successful as to postpone, if not to avoid, the outbreak of such a conflict.

In general the agitation carried on by the miners' unions had for its object the attainment of an eight-hour working day, the fixing of a minimum daily wage, and the enactment of an old-age-pension law. Of these three points the cabinet was inclined to yield on the first two, and during the summer the question of old-age pensions was discussed at length. The scheme advanced provided, in general, that a fund should be created, partly by contributions from the employers and partly by weekly deductions from the laborers' wages, from which stipends, graduated according to years of service, were to be granted to such employees of the mines as were officially declared superannuated. The part to be played by the government was to guarantee an annual income of 3 per cent. upon the capital of the fund. Speaking on June 18, M. Caillaux, minister of finance, declared that the cost to the government at the beginning would be 15,000,000 francs; that the expenditure would rapidly rise to 90,000,000 as pensions became due; but that in the course of time it would sink to a normal outlay of 45,000,000 francs as the total capital of the fund, and with it the income upon it, increased. The minister stated that to meet this large increase in the national expenditure it would be necessary to practice economy in other branches of the public service. No definite action was taken upon the bill before the chamber adjourned in the fall; but when they reassembled on October 22 it was moved by a Socialist deputy that the question of an eight-hour working day, old-age pensions, and a minimum wage be declared urgent. In opposing the motion M. Waldeck-Rousseau declared that the government was absolutely opposed to the minimum-wage proposition, but that it stood ready to consider, though not in the immediate future, the question of pensions and an eight-hour day. The ministry was supported in its attitude by a vote of 290 to 245, and in view of the gravity of the subject under consideration there was considerable shifting of parties. The conservative wing of the Republicans, under Méline, which ordinarily constitutes the backbone of the Opposition, sided with the government on an issue which seemed to transcend party interest and to affect the entire scheme of economic organization. A large number of Socialists and Radicals, on the other hand, voted ~~the~~ ^{against} the ministry upon the question that presented in such a clear-cut manner politics ~~stands~~ ^{of} the laboring classes. This was the most serious problem of internal affairs which the government was called upon to face during the year, and as has been chiefly the case with this miscellaneous ministry, the cabinet owed its preservation followed by no fear both in radical and conservative circles that its fall would country at large. Out ~~s~~ ^{side} advantage to themselves and very probably by harm to the by a fresh agitation on the ~~the~~ ^{part} parliament Waldeck-Rousseau's declaration was met strike to force the government ~~in~~ ⁱⁿ the miners' unions and threats of a general the public favor the chamber on November 14 passed a bill establishing a ten-hour penditure of 68,000,000 francs for the govern. that this would involve an extra ex-

The Czar in France.—The close relation between France and Russia was emphasized during the latter part of September, 1901, by the visit of the Czar to France. In view of the present delicate balance of power in Europe resulting from the approaching termination of international relations (1903), this reassertion of the friendship existing between Russia and France was especially welcome to the latter. The visit of the Czar had been long expected in France, and was preceded by a journey which the foreign minister, M. Delcassé, undertook in a way, prior to St. Petersburg, where he was received with great cordiality by the Emperor. The announcement of the Czar's coming on August 20 was received with expressions of general satisfaction. A majority of the councils-general congratulated the President upon the happy event, and the only discordant note in the harmonious national rejoicing was struck by the general committee of the Socialist party, which called on all faithful members of the party to abstain from any favorable manifestations during the visit of the Czar. The Emperor and Empress landed at Dunkirk on September 18, after reviewing the French fleet outside of the harbor. They were received with great enthusiasm by the population, and at the banquets, formal and informal, which followed, many toasts of friendship were exchanged between the President of the French republic and his imperial ally. On September 19 the Czar was present at the manoeuvres of the Army of the East, near Compiègne, and visited the cathedral of Rheims. The following day he arrived at Compiègne, and was installed in the magnificent chateau in that town which had been prepared for his occupation. The next day at Betheny, near Rheims, he reviewed 160,000 men composing the Army of the East, and on the same day departed for home by way of the North Sea and the Baltic. At the formal banquet at Compiègne President Loubet, in toasting the Czar, said: "No doubt can exist as to the fact that the alliance had its origin in a desire for peace, and no one can deny that the alliance

has contributed to the preservation of the balance of European power—the necessary condition of peace. The alliance has grown with years, and as questions have arisen it has shown itself alert, determined, true to its own interests and to the interests of the world.” Replying to President Loubet, the Czar remarked: “The ties that bind our nations have been strengthened and have received a new consecration through the tokens of hearty sympathy which greet me here and find their echo in Russia. The intimate connection between the two Powers, animated by the most sincere desire for peace and mindful not to intrude on the rights of others though careful of their own, is a powerful element in the preservation of universal peace.”

The point upon which both speakers dwelt so persistently—namely, that the alliance had been the means of preserving peace in Europe—was the one which appealed most to the French nation, and on the whole approximates the truth. There is no doubt that after 1880 many Frenchmen sincerely believed that Germany, disturbed by the rapid powers of recuperation France had shown after the war, would attempt to force another conflict upon the republic which should definitely destroy the power of her ancient rival. From this fate Frenchmen believed they were saved by the strength which the alliance with Russia lent them. Moreover, Russia's friendship not only insured France immunity from further aggressions on the part of Germany, but by freeing her from the fear of attack from across the Rhine it allowed her to enter upon the policy of colonial expansion which has become as dear to the hearts of Frenchmen as it has proved expensive. To these advantages must be added the prestige which French diplomacy, backed up by Russian force, has so recently gained in China. The French nation, then, was earnest in its welcome to the Czar; and, if there was any lack of sincerity in certain quarters, it was rather in the attitude of the Socialist leaders whose ostentatious hostility indicated a struggle between their feelings as Frenchmen and their principles as members of an international party.

The Sultan and the Quays.—In the latter part of August, 1901, the French government became involved in a dispute with the Porte, in which M. Delcassé, the foreign minister, displayed his usual sagacity and energy and reaped his usual measure of success. The trouble originated in certain claims which a French company held against the Porte and for which they could obtain no satisfaction. The company, for valuable consideration, had received permission to build a system of quays in Constantinople, but after they had completed their work the government refused to transfer to them the title to the lands and to the waterfront, the argument for the position taken by the Porte being that the Sultan's life would be endangered by the influx of strangers that would follow upon the opening of the new docks. The company thereupon offered to sell the quays to the government, and the authorities took possession of the property but failed to pay. Repeated requests for satisfaction made through the French ambassador were met by the national Turkish argument of procrastination and excuse. In addition to the claims of the quay company, there were large sums of money due to two French citizens named Lorando and Tubini, who had advanced the funds for the construction of railways in various parts of the country. The French minister at Constantinople, M. Constant, was persistent in his demands on the Turkish foreign office. His action, however, not only failed to produce any result, but awakened the hostility of the government against French citizens throughout the empire, and the Turkish authorities entered upon the systematic persecution of the French religious establishments in Asia Minor and Palestine. After considerable haggling, matters were finally adjusted in an interview between the French ambassador and the Turkish foreign minister, in the presence of the Sultan, but at the last moment the Turkish government went back on its word and seemed intent on entering once more on the weary round of pretence and palliation.

On August 26 M. Constant left the city, and though the other members of the embassy remained behind, diplomatic relations were definitely broken off. After the arrival of Constant in Paris, August 29, the French foreign office sounded the various Powers, and found that there would be no opposition to an energetic move on the part of France against the Porte. On November 5 a squadron, under Admiral Caillard, took possession of three custom houses on the Island of Mitylene, but held them for six days only, as the Sultan, convinced that there was nothing further to be gained by delay, conceded all the demands of the French government. In detail the terms of the agreement were as follows: (1) The Turkish government recognized the legal existence of all schools throughout the empire managed by the French or under the protection of France, and exempted such schools from taxation; (2) it recognized the legal existence of all the churches, hospitals, and asylums under direct French control or under French protection, and exempted such institutions from taxation; (3) it permitted the founding of new schools throughout the country; and (4) recognized as legal all French eleemosy-

nary institutions that might be erected in the future, if no objections were made by the Turkish authorities within six months. The fiscal claims were met by a lien granted on the customs. On November 20 M. Constant returned to Constantinople, and on November 29 was received in official audience by the Sultan.

Colonial Policy.—In 1901 an important advance was made in the development of French colonial policy by the institution of a separate budget and financial administration for Algeria. This act marked a departure from the old policy of centralization which, in the opinion of many judges, has proved one of the greatest obstacles in the way of French colonial development. The problem that has confronted the supporters of a colonial policy in France up to the present has been the difficulty of maintaining distant possessions and developing their natural resources without a body of French inhabitants as a nucleus of power. Frenchmen have in fact shown almost no desire for emigration and very little capacity for adapting themselves to conditions in new countries. Financially the French colonies have been a burden upon the mother country. The annual budget for the colonies has averaged during the last few years about 130,000,000 francs, and of this large sum the greater part is spent on the maintenance of the military and naval establishments, and comparatively little upon the internal development of the colonies. In 1901 the appropriations for the colonies amounted to 111,000,000 francs (of this 90,000,000 for military expenses), and if the supplementary grants be added the total expenditure would attain the usual amount. For 1902 the appropriation asked by the government was 116,000,000 francs, with a probable total expenditure of 140,000,000 francs. In return for this outlay the government has been able to show no direct compensation, and the only justification for the continuance of such an expensive policy has been the benefit which French commerce supposedly derives from such a course. So far the balance of trade has not been sufficiently in favor of France to compensate even in measure for the sacrifices made by the government, and figures show that up to 1899 the greater part of the volume of trade in the French colonies passed through the hands of foreign nations. At the same time there has been a steady though slow development in favor of French mercantile interests. In 1900 the imports into the French colonies from France amounted to 203,200,170 francs; from French possessions 12,886,489 francs; and from foreign countries 209,459,657 francs. For the first time this showed an excess of French importations over foreign commodities. The exports during the same year from the French colonies were: to France, 152,288,411 francs; to French possessions, 8,277,711 francs; and to foreign countries, 169,664,100 francs; and though the exports still showed a slight advantage for foreign interests, the difference in their favor was by no means as pronounced as in the preceding years.

How unwilling Frenchmen are to abandon their native land for new countries is shown by statistics which, so far as obtainable, indicate that in 1899 487 men, women, and children left France for the colonies. In 1900 the number rose to 593. Including Algeria and Tunis it is probable that not more than 2,500 Frenchmen annually go to swell the colonial population, and these are more than offset by the large number of colonials that are constantly settling in France. The reluctance to emigrate continued in spite of various inducements offered both by the government, in the shape of free land grants in Africa and Indo-China, and by the offer of free transportation to any part of the colonial empire on the part of shipowners. It would seem, then, that if the French colonial empire is to be preserved and strengthened it must be grounded, not upon a European population transported to Asia or Africa, but upon the bulk of the native population, which must be conciliated by a liberal but firm policy.

It was partly because French statesmen have recognized the necessity of adopting such a course of action that the separation of Algeria from France, so far as financial administration is concerned, was effected. The change was made on June 3, when the financial delegations began to vote the budget for the colony. The delegations are composed of 69 members, of whom 48 are French colonists and 21 natives. Contemporaneous with the separation of Algeria from France, a process of decentralization was entered upon within Algeria itself. The administration was greatly simplified, and much of the power formerly vested in the governor-general was transferred to the prefects, upon whom was enjoined the strict supervision of municipal affairs in their various departments. The necessity of conceding a greater measure of rights to the native population had been shown during the year by a spirit of unrest among them. See ALGERIA.

Other events connected with colonial policy during 1901 were the establishment of a West African bank for the purpose of doing business in Senegal, French Guinea, the Ivory Coast, Dahomey, and French Congo. Railway lines were projected from Ain Sefra to Igli, and from Fahs to Kalaa-es-Senan, in Africa. In January a road from Antananarivo, in the interior of Madagascar, to the sea, was opened. The French possessions in Central Africa were divided for administrative purposes

into three territories—the North Soudan, Volta, and the region between the Niger and Lake Tchad, all three dependent on the governor-general of West Africa. More important, in the opinion of the government, was the initiation of a system of submarine cables to connect all the French possessions with the mother country. Up to the present, the foreign office has been at a disadvantage in being forced to make use of foreign cables for the purposes of communicating with the colonial authorities. In the case of war such a state of affairs would, of course, be extremely unfortunate for France. In 1901 cables were being laid from Thu-nan, in Indo-China, to Amoga—a distance of 800 kilometres—and from Amoy to the Russian port of Vladivostok.

FRATERNAL ORGANIZATIONS, a title usually applied, or understood to apply, to those secret societies which maintain a death, sickness, or accident fund for their members. Many of these societies are under the surveillance of the State insurance departments, which exact from the governing bodies such an amount of statistical information as tends to check betrayal of trust. Below is a list of the principal organizations in this country:

Name.	Date of Foundation.	Membership.	Benefits Disbursed Since Organisation.

FREDERICK, VICTORIA ADELAIDE MARY LOUISA, dowager empress of Germany and princess royal of Great Britain and Ireland, died at Kronberg, August 5, 1901. She was born in England, November 21, 1840, the eldest child of Queen Victoria and Prince Albert, and received a careful and thorough education under the personal supervision of her parents. She was married in London, January 25, 1858, to the Crown Prince Frederick William, of Prussia, who succeeded to the throne of Germany, March 9, 1888, and died June 15 of the same year. Of the eight children resulting from this union, six survive, including the present Emperor William. As wife of the crown prince, and, later, as empress, her influence over Frederick William was evident in many of his actions and caused a bitter and long-continued

conflict between herself and Bismarck. She was accused of attempting to introduce into Germany the liberal political principles of her early education, and, though this accusation was denied by those who were in a position to know her political motives, the discussion of it has filled many columns of the German press. During the Franco-Prussian War, her influence over Frederick William was apparent in his refusing, at her request, to bombard Paris; and this was designated an "act of unjustifiable interference" by Bismarck. In all affairs of state it was evident that the peaceful spirit of the crown princess, later empress, was in continuous conflict with the "blood and iron" policy of Bismarck, a controversy which was the cause of great sorrow to the empress. Upon the accession of the present emperor an estrangement arose between him and his mother, commonly attributed to the stand he seemed to be taking in regard to the conflict with the chancellor. Although he had been carefully trained by the latter to disdain everything English, in the hope of discontinuing the empress's course, filial affection operated with different effect, and in 1892 Bismarck was summarily removed. Whether this step was merely the culmination of the long controversy between empress and chancellor, or whether other causes were represented, it is impossible to say, but the reconciliation of the emperor with his mother immediately afterward is an event which points to the former reason. Although bitterly opposed by the German press for her so-called attempt at the Anglicization of Germany, the splendid character of the woman, considered as a woman, and the terrible physical suffering she underwent just before her death, melted this antagonism, and her death was regarded as a national bereavement, the burial services being attended by scenes of the deepest mourning.

FREE BAPTIST YOUNG PEOPLE, UNITED SOCIETY OF, since its founding in 1888, has attained to a membership of 23,000 in 1901, distributed among some 500 young people's societies and 150 junior societies. It is a denominational union of all the young people's societies, the majority of which are Christian Endeavor bodies. In addition to general Christian work at home, the union maintains missionaries in India and Africa, of whom there were eight in 1901. President, E. P. Metcalf, Providence, R. I.; secretary, Harry S. Myers, Hillsdale, Mich.

FREEMASONS, represented by thirty grand lodges in the United States and British America, reported in 1901 a total membership of 877,762, showing a net gain of 20,185 over the preceding year. These grand lodges are affiliated with the English grand lodge, of which the Duke of Connaught is grand master (succeeding King Edward), and with the grand lodges of Ireland, Scotland, Victoria, New South Wales, South Australia, Cuba, and Peru, as well as with those of Austria and Germany.

FREE METHODIST CHURCH, organized in 1860, reports for 1901, 997 preachers, 1,034 churches, with property valued at nearly a million and a half dollars, and 28,858 members, including 3,180 probationers. It maintains a college and six seminaries, and has a publishing house in Chicago, the denominational headquarters. The annual conference of the church was held at Alexandria, Va.

FREMANTLE, General Sir ARTHUR JAMES LYON, British soldier, died at Cowes, England, September 25, 1901. He was born in 1835, the son of Major-General J. Fremantle, C.B., and was educated at Sandhurst. Entering the army as ensign in 1852, in 1860 he reached the rank of lieutenant-colonel, and was made assistant military secretary at Gibraltar. He was promoted major-general in 1882; in 1884-85 he was governor of Suakim; in 1885 he commanded a brigade in the Soudan expedition; in 1886-92 he became deputy adjutant-general at headquarters; in 1893 he assumed command of the Scottish district, and in 1894-98 he acted as governor of Malta. During his short administration at Suakim General Fremantle made an enviable record in rendering the district habitable, and throughout his service was known as a capable, conscientious officer. He attained the rank of full general in 1896.

FRENCH CONGO, a French colony in West Africa, extending northeastward from the coast to the French Soudan, and lying between Cameroon, on the northwest, the Egyptian Soudan on the northeast, and the Congo Free State on the east and south. Its northern boundary is formed by the districts of Wadai and Bagirmi, which were separated from French Congo in September, 1900, to form, together with Kemo and Kanem, the *Territoire militaire des pays et protectorats du Tchad*. (See FRENCH SOUDAN.) The area of the colony is estimated at 450,000 square miles, and the population at from 12,000,000 to 15,000,000. The inhabitants are Bantu negroes, Adumas, Rendais, Gallas, etc., and too lazy to be good workmen. The country is administered by a commissioner-general, whose seat is at Libreville, on the northern shore of Bagoon. He is assisted by two lieutenant-governors. The budget for 1900 balanced at 3,834,060 francs. In 1901, 2,078,000 francs were contributed to the budget by France. There has been organized a system of developing this rich but thus far unproductive region by means of concessions, of which more

than 40 have been granted, covering 761,240 kilometres. The grants range from 22,000 square kilometres to 140,000 square kilometres each. The industries are mainly the raising of rubber and the production of kola, palm oil, coffee, cacao, and piassava. The planters pay about \$40 a hectare for their land, and are bound to plant every five years at least 5 feet of caoutchouc for every hectare, nor is their possession finally confirmed until a fifth of their land has been made productive. Concessionaires who have taken up more than 10,000 hectares are bound to plant 55 feet of land with caoutchouc for every ton of rubber produced in their district. In order to encourage agriculture, the government gives absolutely to the planters land of which a twentieth is planted with cacao, coffee, vanilla, indigo, and tobacco, and of which the rest is planted with rice and manioc. In order to foster stock-breeding, the government gives land to the farmer who will raise for five years on this land two head of cattle or four calves for every hectare; if he raises elephants he is given a hundred hectares of land for every elephant. These concessions are in their infancy and have not begun to be greatly productive. In an article in *La Revue Politique*, M. Bouisson asserts that to develop a concession of from 5,000 to 10,000 hectares, \$200,000 is necessary. The development is hindered by lack of transportation facilities. There is a plan to build a railroad from Libreville to the Congo, but it has not yet been carried into execution. A telegraph line connecting Brazzaville with Loango, on the west coast, is complete, and provides direct communication with Libreville from any station of the English Atlantic cable.

A revolt broke out in French Congo at the end of July, 1901. The factories on the Ogowe, in which there were 50 Europeans, mainly Belgians, were reported to be surrounded by 18,000 natives. It was said that four Europeans had been killed. A gunboat was ordered up the river, but she was unable to reach the scene of the insurrection, owing to the lack of water in the channel. In the fall of 1901 a rising of the Grabouine cannibal tribes at Cape Lopez was suppressed by a French force.

FRENCH GUIANA, a colony of France on the northern coast of South America, has an estimated area of 46,850 square miles, and a population, not including mountain Indians and convicts, estimated at 30,000. The capital is Cayenne, on the island of Cayenne, off the coast, population 12,351. The colony is administered by a governor, assisted by a privy council of 7 members. There is a colonial council-general of 16 members. The colony sends one deputy to the French chamber. A military force of 371 French soldiers is maintained. The local budget for 1900 balanced at 2,498,439 francs (franc equals 19.3 cents). The subvention provided in the French budget of 1901 was 6,857,057 francs, of which 5,585,700 francs were for the penal establishment. Certain convicts receiving sentences for more than 8 years are deported to this establishment from France and French territory. They number about 4,300. There is very little agriculture, only about 8,800 acres being under cultivation. Rice, maize, manioc, coffee, sugar cane, indigo, cacao, and tobacco are the principal crops. The leading industry is gold mining; silver, iron, and phosphates are worked. The valuable forests in the interior have been little exploited. The gold exports in 1899 amounted to 81,715 ounces; rum, cacao, and phosphates are the other chief exports. The total exports in 1899 amounted to a value of 6,844,076 francs; the imports 10,039,731 francs. The foreign trade is mostly with France. There are regular steamship connections, and telegraphic connection with Georgetown, British Guiana. There are no railroads. There is a college at Cayenne.

FRENCH GUINEA, a colony of France on the west coast of Africa, lying between Portuguese Guinea on the north and Sierra Leone on the south, was increased in area by the reorganization in October, 1899, of the French possessions in West Africa. It now comprises, in addition to the protectorate of Futa Jallon, the districts of Dinguiray Siguiri, Kurussa, Kankan, Kissidugo, and Beyla. The area of these additions is about 47,000 square miles, so that the entire area of the colony now amounts to 95,000 square miles. The population, which was about 1,000,000, has been increased by the additions to 4,200,000, chiefly negroes. The chief of the administration is the governor-general of West Africa, whose seat is at St. Louis, in Senegal. The local administration is in the hands of a governor, whose seat is Konakry. The colony has rapidly become prosperous. The local budget increased from 1,571,000 francs in 1899 to 2,870,000 francs in 1900. The imports increased from 9,019,875 francs in 1898 to 15,441,710 francs in 1899, and the exports from 7,799,975 francs in 1898 to 9,461,496 francs in 1899. The principal products are rubber, gum, palm oil, rice, and millet. The bulk of this trade goes to France, but the proportion which goes to England is steadily increasing. Five steamship companies—two French, two English, and one German—visit regularly the port of Konakry, where a wharf extending into deep water is to be constructed for their accommodation. A railway from this town to the Niger has been begun.

FRENCH LITERATURE. *History and Biography.*—The general trend of historical research during 1901 followed rather closely along the lines established

in the previous year. The document, whether in the form of memoir, journal, or correspondence, is still high in favor, and popular interest in the period of the First Empire continues unabated. Nevertheless, there are a number of important works which show that these special tendencies are not being followed to the detriment of interest in general history. Noteworthy among these is the first volume of a bibliographical work by Auguste Molinier, *Les Sources de L'Histoire de France*, which ought to give fresh impetus to the study of French history, especially of the mediæval period. The present volume covers "L'Epoque Primitive: Mérovingiens et Carolingiens," and enumerates in methodical order the narrative sources of French mediæval history, indicating the principal memoirs and articles to be consulted upon each author and work mentioned. A unique contribution to the history of a still earlier period, dating back to the days of Cæsar's *Bellum Gallicum*, is Camille Jullien's *Vercingetorix*. This volume is a rather remarkable piece of erudition. While adhering strictly to the approved methods of scientific history, the author has succeeded in reconstructing a vivid picture of Celtic days, and especially of the personality of this early Gallic hero, who dared to dream of a Celtic fatherland, bound together by firmer ties than those of clans, or tribes, or leagues, and who devoted his life to the realization of his dream. Another important volume is Charles Diehl's *Justinien et la Civilisation Byzantine au VI^e Siècle*. M. Diehl's study is inspired by the pious wish to make us realize the extent of the debt which modern civilization owes to this old Byzantine emperor and lawgiver. Historians, from Gibbon on have recognized that Byzantium did inestimable service to Christendom down to the time of the fourth crusade, by patiently standing guard on the eastern frontier of Europe. But how much of the credit is due directly to Justinian, whose statesmanship made Byzantium what it was, is the task that M. Diehl set himself to show. A leap of several centuries brings us to a rather curious volume, rich in documentary material, *Henri IV. et les Députés de Genève*, by M. F. De Crue. From the days of Henry III. there had been regular diplomatic relations between France and the little Calvinistic republic in the Alps. But aside from its interest as a contribution to diplomatic history, the volume is full of unpublished letters and conversations which throw new light upon the complex character of Henry of Navarre. *Le Mariage de Louis XV.*, by Henri Gauthier-Villars, is a careful and exhaustive study of comparatively recent yet little-known events, and is based upon unpublished documents which go far toward clearing up certain obscure questions. A volume which has a personal as well as historical interest is *Le Dernier Bienfait de la Monarchie*, since it is the last literary work of the eminent historian, the late Duc de Broglie (q.v.), finished only a few days before his death. The purpose of the volume is to show that the neutrality of Belgium was the last service rendered by the house of Bourbon to France—a service which, the author claimed, had never been sufficiently recognized. Professor E. Glasson, who is *doyen* of the faculty of law at the University of Paris, has contributed an important volume to the constitutional history of France, *Le Parlement de Paris, son Rôle Politique depuis le Règne de Charles VII., jusqu'à la Révolution*. It is a work at once broad in spirit and minute in detail, and covers the subject much more exhaustively than the kindred studies of Messrs. Fayard and Aubert. Somewhat more than a year ago Victor du Bled published the first volume of his entertaining study of French social life, *La Société Française du XVI^e au XX^e Siècle*. The second part continues the subject with undiminished interest, down through the seventeenth century. The author has gone first for information to the preachers and moralists, who from the very nature of their calling have little else to show than the faults of their epoch. The other side of the picture is given in a series of delightful chapters devoted to The Salon of Mlle. de Scudéry, The Friends of Mme. de Sévigné, and others of that cultured group to whom Parisian society of that day owed its charm. Several other series of real importance received additional volumes in 1901. Among them are the second part of the Comte d'Haussonville's *La Duchesse de Bourgogne et l'Alliance Savoyarde sous Louis XIV.*; the sixth volume of Emile Ollivier's *L'Empire Libéral*, which treats of Poland and the elections of 1863, and devotes a lengthy chapter to Renan, Comte, and the philosophical tendencies of the period; and M. E. Zévort's *Histoire de la Troisième République*, Vol. IV., which covers the administration of President Carnot; and while it does not altogether fulfill the promise of its title, is, as far as it goes, an impartial and well-informed survey of the period.

Turning to the numerous biographies and memoirs dealing more or less directly with the First Empire, we must mention, in the first instance, Frédéric Masson's *L'Impératrice Marie-Louise*, which forms a continuation of the author's long series of picturesque historical monographs, following directly after his *Joséphine, Impératrice et Reine*. The Marie-Louise whom he sets before us is a stout, characterless woman, incapable of strong emotion, and to the last consistently misunderstood by Napoleon. The volume is at once a study of general history drawn in bold strokes and a biography marked by penetrating psychological insight. *Bernadotte, Napoléon*,

et les Bourbons is the title of a volume by Leonce Pingaud, which is really a careful biographical study of the extraordinary figure of Bernadotte, based upon unpublished documents preserved in Sweden and in the foreign archives of France and Russia. The widespread interest in this period has led even such a veteran novelist as Ernest Daudet to join the ranks of historians, with a volume on *La Conjuration de Pichegru*. He discusses the charge of treason against Pichegru in all its details, and by showing the untrustworthy character of much of the testimony, raises something more than a question of doubt in his favor. The second volume of the *Souvenirs du Vicomte de Reiset*, which covers the period from March, 1809, to June, 1815, contains some curious details of the intimate life of Napoleon, his family, and those who were closest to him, and especially of the Empress Josephine.

Few careers offer better material for entertaining memoirs than those of veteran diplomats, if only they are blessed with the happy faculty of recording what they have seen. A good example of this is *Un Diplomate Français à la Cour de Catherine II. (1775-1780)*, a sort of *journal intime* kept by the Chevalier de Corberon, who was *chargé d'affaires* during these years at the court of the great Catherine, and who gathered and recorded many a *chronique scandaleuse*. *Mes Souvenirs* is the laconic title of a volume by another French envoy, the Comte de Reiset, who adds the subtitle, *Les Débuts de l'Indépendance Italienne*. The author records impressions gained while he was attached to the embassy at Rome under Gregory XVI., and as *chargé d'affaires* at Turin during the war of 1848 and the beginning of the reign of Victor Emanuel. Two other volumes of kindred interest deserve mention—*Souvenirs de Carrière, 1855-86*, by the Baron de Michels, who has made an attractive record of his long and useful career, but, being a thorough diplomat of the old school, carefully refrains from any statement which might be construed as bearing upon current politics; and *Ce Que J'ai Vu*, by General Castrex, covering years of service in the Crimea, in Italy, in Mexico, at Metz, and at Paris. It is the personal narrative of one who was a gallant man and a valiant soldier, and whom a kindly critic has defined as "a belated *mousquetaire* under the Second Empire and Third Republic." The prevailing tone of the two volumes is a kindly humor, tinged with a shade of bitterness.

In turning from the lives of men of action to those of men of letters, we find several volumes of an autobiographical nature which demand rather special attention. First on the list comes Victor Hugo's *Post-scriptum de me Vie*, made up of pages dating mainly from his days of exile, a period when the poet's feeble health brought him especially close to "the side of mystery." The contents are a curious miscellany of meditations on man, God, and nature, interspersed with literary studies of Shakespeare, La Fontaine, Voltaire, etc. The editor, Paul Meurice, has called it "a sort of testament of the poet's thoughts, the sum of his experience and his wisdom, the last word of his literary criticism, and his religious philosophy." Another literary legacy of importance is *Notes et Souvenirs*, by Victor Duruy, covering the years from 1811 to 1894. The veteran historian has recorded his own life in these two bulky volumes down to the smallest detail, from his infancy, passed at Gobelins, down to his reception at the Academy in 1885. Not the least interesting chapters are those in which he describes, as eye-witness, the exciting events of 1830, 1848, and 1870, commenting upon them with admirable acumen and judgment. *Le Soir de ma Journée* is the second volume of posthumous memoirs by Jules Simon, forming a sequel to his *Premières Années*. It contains some interesting details of the Coup d'Etat, the Empire, the "18th of March," and the Academy. There are annotations by the author's son, Gustave Simon. Two new volumes in the Grands Ecrivains Français series must be mentioned—*Alexandre Dumas*, by Hippolyte Parigot, and *François Villon*, by Gustave Paris. The choice of M. Parigot was a happy one, since he has not only long made a study of the early dramatists of the nineteenth century, but he is already the author of a voluminous and admirably written volume on *Le Drame d'Alexandre Dumas*. M. Paris's study of Villon is not merely a scholarly and comprehensive biography, but is a vivid picture of the heterogeneous and corrupt society of Paris in the fifteenth century. *Ivan Tourgueneff d'après sa Correspondance avec ses Amis Français*, by Halperine-Kaminsky, is a work which ought to throw interesting light upon the Russian writer's literary development. It is well known that Tourgueneff made France a second home, and that many of his French friends exerted a strong influence upon his genius. M. Halperine-Kaminsky has succeeded in recovering the greater part of his correspondence with George Sand, Sainte-Beuve, Theophile Gautier, Gustave Flaubert, Taine, Zola, Maupassant, and many others.

Literary and Critical Essays.—The art of criticism flourishes in France to a degree unparalleled elsewhere, yet the published volumes of critical essays in 1901 include few works of real significance. *Etudes de Littérature et d'Histoire*, by Albert Sorel, includes on the literary side appreciations of Montaigne and Pascal, Taine, Sainte-Beuve, and Maupassant, and on the side of history, studies of Napoleon,

Waterloo, etc. *Figures et Caractères*, by Henri de Régner, has special interest for English readers, because it contains, in addition to estimates of Hugo, Michelet, Mallarmé, and other French writers, critical papers upon Oscar Wilde and Rudyard Kipling, a rather bizarre combination from the Anglo-Saxon point of view. A group of studies of English writers, by Mary Duclaux (Mme. Mary James Darmesteter), are collected under the title *Grands Ecrivains d'Outre-Manche*, and include papers on the Brontë sisters, Thackeray, the Brownings, and Rossetti. *Cinq Ans Chez les Sauvages*, by Ernest La Jeunesse, is a collection of studies on contemporary writers, written, as the title suggests, in a spirit of caustic criticism. A volume which may be heartily commended is *La Fenêtre Ouverte*, by Fernand Gregh, who is best known as the author of such delicate verse as *La Maison de l'Enfance* and *La Beauté de Vivre*. The present work, which includes appreciations of Hugo, Henri de Régner, Anatole France, Zola, d'Annunzio, and Rostand, is evidence that on some occasions a poet may become one of the best of critics. *Art et Littérature*, containing much about literature and very little about art, is the work of Michel Salomon, an unfamiliar name, although the author already has one volume of criticism to his credit. Loti, de Vogüé and Maeterlinck are some of the writers discussed in these pages. Adolphe Brisson's *Portraits Intimes* are too well known to need further attention than the brief notice that he has added a fifth volume to the series, with somewhat wider range of subject than usual, since it includes even a paper upon President Kruger.

Among the few literary monographs which deserve special notice is one upon *Les Classiques Imitations de Ronsard*, by Edmond Dreyfus-Brisac. The author makes it very clear that while the classic writers of the seventeenth and eighteenth centuries disdained Ronsard, they were not ignorant of him. On the contrary, the works of Malherbe, Racine, Corneille, and even Boileau himself, show a large number of passages which owed their inspiration to Ronsard, and in some instances were deliberately copied from him. *Le Théâtre Français avant la Période Classique*, by Eugène Régat, is another scholarly work bearing the stamp of original investigation. It deals almost wholly with the organization of the theatre, containing chapters on such subjects as the theatres of Paris from 1548 to 1635; the expenses and receipts; the actors; the public; the preparation of spectacles; and similar subjects. *Conteurs Florentins du Moyen Age*, by Emile Gebhard, is a sympathetic and intelligent study of the early Italian *conteurs*, including Francesco da Barberino, Boccaccio, Sacchetti, etc. Passing mention should also be made of Jean Bertheroy's *Eloge d'André Chemier*, a study crowned by the Academy; *Le Style Epistolaire*, by Vicomte de Broc, with special reference to the letters of Balzac, Voltaire, and Mme. de Sévigné, and a clever essay on the epistolary style of women; and *Sainte-Beuve Inconnu*, a collection of unpublished pages edited by the Vicomte de Spoelberch de Lovenjoul.

Poetry.—The poetry of the year 1901 may be quickly summed up, since it includes nothing that impresses one as being especially inspired or especially novel. M. Sully-Prudhomme (*q.v.*), who still adheres to the traditions of the Parnassians, betrays in his *Testament Poétique* his resentment against the younger group of innovators who are venturing to tamper with traditional metres. Another belated Parnassian is Albert Merat, whose *Vers le Soir* contains some charming verse composed strictly in accordance with the established rules. Jean Moréas, once a high-priest of symbolism, has quite changed his manner. There is little that is symbolic in *Les Stances*, but, on the contrary, a return to the simplicity of the language and manner of Ronsard. Simplicity is the keynote of the new school of poets, the school of which Francis Jammes is perhaps the chief exponent. Sincerity and exactness of expression are this poet's chief characteristics, but he refuses to be bound by any established rules either of taste or of metre. His latest volume is *Le Deuil des Primevères*, which has a touching element of almost childlike naïveté. Other volumes of verse which have won praise to a greater or less degree, include *Lumières Tranquilles*, by Adolphe Retté, who sings of nature, and sunshine, the dawn, and the twilight; *Paysages*, by André Dumas, verses pervaded with a spirit of mild melancholy and full of originality; *L'Arbre et les Vents*, by Joachim Gasquet, elegiac stanzas suggesting a comparison with the *Contemplatives* of Hugo; and *Le Coffret d'Ebène*, by Valère Gille, containing some verses of real harmony and nobility of thought, well worthy of the author of *Le Collier d'Opales*.

Fiction.—When we turn to novels, 1901 has been what may be termed a good year. New volumes by Bourget, Zola, the brothers Margueritte, André Theuriot, Edouard Rod, and René Bazin, are in themselves sufficient to make the year a notable one. *Travail*, the second of Zola's *Four Gospels*, can scarcely equal the popularity of *Fécondité*, which preceded it. It is perhaps best defined as a sort of epic poem in prose, celebrating human labor. But the human interest of the individual characters has been in part sacrificed through the author's absorption in the development of his somewhat visionary socialistic doctrines. Bourget's latest work,

Le Fantôme, deals with a theme which the Anglo-Saxon reader will naturally find repellant; but that does not prevent it from being an exceptionally profound and truthful study of the human heart. The central idea is this: A man who was for many years the lover of a married woman much older than himself, consoles himself after her death by marrying her daughter, whose resemblance to the mother amounts almost to a reincarnation. Instead of finding the happiness that he hoped for, he finds indescribable torture; for the memory of the dead woman, pushing in at all times like a phantom between him and his unsuspecting wife, urges him on to self-destruction and hastens the day when she, too, must learn the truth. M. André Theuriot has been exceedingly industrious of late. In less than two years he has produced three novels: *Illusions Fauchées*; a political novel of the early forties, called *L'Amie de Noël Tremont*; and *La Petite Dernière*, a picture of family life of to-day, where the mother's absorption in literary pursuits leaves her three daughters free to compromise themselves in reckless flirtations, until the hero, a type of chivalrous naval officer, appears just in time to fall in love with the youngest, "la petite dernière," and rescue her from the bad influence of her sisters. MM. Paul and Victor Margueritte have also been active, for they have followed up the recent triumph of their *Tronçons du Glaive*, the second part of their trilogy of the war of 1870, with a volume of short sketches, *Les Braves Gens*, which also deal with episodes of the same war. Among the novels which appeared during the autumn, scarcely any has made a more profound impression than *Les Oberlé*, by René Bazin. The theme is one which necessarily appeals to a French public, especially when treated with such perfect fairness and impartiality as M. Bazin has accorded it. It is the history of a French family in Alsace, some of whom remain unswervingly faithful to their former country, while others, the younger members for the most part, resign themselves little by little, becoming gradually, almost imperceptibly, Teutonized. The strength of the book lies in its obvious sincerity, and its attempt to present the case both from the French and German points of view. The title of Edouard Rod's latest story is *Mademoiselle Annette*. It has the same characters, the same scene, and much the same atmosphere as *Les Roches Blanches*. The heroine is one of those gentle, self-effaced personalities whose whole life is made up of obscure sacrifices, and who, when no longer of practical use to any one else, fades gently away, careful even in her death not to inconvenience others. A book which has recently scored a well-deserved success is *Les Robinsons de Paris*, by Georges Beaune, author of *Vendanges* and *Sainte-Nitouche*. It is a kindly satire upon those honest provincial folk who find themselves irresistibly drawn to Paris, and when there feel themselves more isolated, more hopelessly lost in the midst of the crowd than ever Crusoe in his desert isle. After these novels of undoubted merit, the choice becomes more difficult. *Un Mari Pacifique*, by Tristan Bernard, is the logical sequel to that author's *Mémoires d'un jeune homme rangé*. It is praised for the truth of its minute details, while its humor is of the variety which lies on the borderland of pathos. Mme. Jean Berthéroy has recently preferred to go to antiquity for her themes, but the scenes of *Le Mirage* are drawn from contemporary life. She takes her heroine fresh from the convent, at the moment when the illusions of life flourish on every side, and when she is most prone to mistake the pleasures of the senses for true happiness. She is fortunate, however, in having a wise and patient husband, whose tenderness eventually awakens a responsive chord in her heart. *Monsieur de Phocas*, by Jean Lorrain, is worth passing mention, if only for the bizarre nature of the plot. It is the story of a man who is dying because he seeks in vain in the eyes of every woman whom he meets for certain reflected rays of mingled green and blue light—a rare, indefinable shade, which he can never find, and which he must find before he can be at rest. Among collections of short stories are a few of rather more than common interest: *Le Sang de la Sirène*, by Anatole le Braz, simple yet moving tales of the Breton coast; *Les Amants Singuliers*, by Henri de Régnier, containing three grim tragedies of love; and *Contes Espagnols*, by Jean Richepin, which forms the fourth volume in a recently established series, *Contes de Tous les Pays*.

FRENCH SOUDAN includes the French possessions in Africa extending from Lake Debu, on the west bank of the Niger River, eastward across the continent as far as the Egyptian Soudan. The region is bounded on the north by the vast desert area of the Sahara, which is also under the protection of France, and on the south by the Ivory coast, the Gold coast, Togoland, Dahomey, Nigeria, and Cameroon, and it is in connection with French Congo on the southeast. The area of the French Soudan is in the neighborhood of 300,000 square miles, and the population is between 3,000,000 and 4,000,000. In 1899 portions of the west and southwest of this territory were divided, for administrative purposes, from the Soudan proper, and placed under the administration of Senegal, Dahomey, and French Guinea; and at the same time, the northern and northeastern part of the Soudan was divided into two districts under the administration of military officers. By the decree of September

5, 1900, a Military Territory of the Regions and Protectorates of the Tchad was divided off from French Congo, and placed under a commissioner, who is responsible to the commissioner-general in France. The new protectorate comprises the river-basin of Kemo, as well as the districts of Schari, Bagirmi, Wadai, and Kanem. This military territory has a separate budget, and its income is derived from taxes imposed on the natives. It supports an army of 744 natives, officered by French. There are 27 officers, 2 surgeons, and 63 French non-commissioned officers. The chief administrative authority of the rest of the Soudan is in the hands of the governor-general of French West Africa, who is resident at St. Louis, in Senegal. The most important city in this region is Timbuctu, on the bend of the Niger, a town of about 20,000 inhabitants. In 1901 the troops in the military territories numbered 8,400, of whom 4,760 were natives. The budgets of the two military provinces in the northwest are incorporated with the budget of Senegal. The budget of the rest of the Soudan balanced in 1899 at 3,238,500 francs the government appropriation of 1900 was 6,833,000 francs. The most important products are rubber and gum, but rice, millet, wheat, and peanuts are cultivated by the natives. The exports for 1898 were 3,700,000 francs, and the imports amounted to 10,800,000 francs. Most of the merchandise is imported through Tripoli and Morocco by caravan across the desert. Seven-tenths of the fabrics sent from Europe to Tripoli find their way to the Soudan. Among the other imports are wool, chiefly from Austria; cotton goods and other textiles, mainly from Manchester; sugar, from Austria; tea, from Malta; hardware and tin, from Germany, the hardware consisting chiefly of padlocks, hinges, small chains, iron bars, wire, etc.; and glasses and mirrors, plated jewelry (solid gold is not in demand), and imitation gems, which must be either red, white, or blue. The most important of all the imports is perfumes, and the yearly sales of these to the natives amount to \$80,000.

The forces of native tribes which have opposed the French administration, particularly in the Lake Tchad region, were scattered early in 1901 by the defeat of the forces under the sons of Rabah, a powerful chief who was killed in 1900. On August 23, 1901, a column of Spahis and infantry, under Captain Dangerville, defeated Fadl-ullah, one son of Rabah, and killed him, and two days afterward the other son, Neibe, together with 1,500 natives, surrendered. In the meantime, in Wadai, early in 1901, there had been an insurrection against Sultan Ibrahim, who fled and was assassinated. Sultan Ben Ali took his place and the civil war ceased.

FRENCH WEST AFRICA comprises, for purposes of administration, all the French possessions in Africa south of Algeria, except French Congo; namely, the Dahomey (*q.v.*). A governor-general, at St. Louis, in Senegal, is in charge of all these districts. Local governors administer the affairs of each colony or military district. The budgets of 1900 showed expenditures by the colonies in West Africa as follows: Senegal, 4,454,611 francs (for education, 355,976 francs; for public works, 661,442 francs); French Guinea, 2,870,000 francs (for public works, 810,000 francs); Ivory Coast, 1,403,000 francs (for public works, 218,000 francs); Dahomey, 2,000,000 francs (for public works, 622,220 francs). The appropriation of France for military service in West Africa for 1901 was estimated at 750,000 francs. The entire expenditure of the mother country on West Africa in 1901 was 13,650,446 francs. A West African bank was established in Paris, in 1901, to operate in all these provinces. (See FRANCE, paragraph Colonial Policy.) The development of large portions of this region has been retarded by the deleterious effects of the climate on Europeans. In 1901 a medical commission was sent by France to ascertain the causes of fever in the region, and to report as to the best measures for checking disease.

FRICK, HENRY CLAY, an American manufacturer, who became in 1901 one of the prominent members of the United States Steel Corporation (*q.v.*), was born at West Overton, Pa., December 19, 1849, and was educated in the common schools of Pennsylvania. He began his business career as a clerk in the store of his grandfather, who was a flour merchant and distiller. Later he went into the coke-making business, and by a process of combination his company gained control of a large part of the coke output of the United States. Afterward he joined the Carnegie Steel Company, serving as its president during the Homestead strike in 1892, when he was attacked and wounded by an anarchist. His name has been connected with various charitable enterprises.

FRIENDLY ISLANDS, a group of islands in the southern Pacific, 300 miles to the east and somewhat south of Fiji, constituting a British protectorate. They comprise three groups, Tonga, Haapai, and Vavau, with a total area of 374 square miles, and a population, in 1901, of 19,963 natives of Tonga, 350 other natives, 150 English, 89 other foreigners, and 120 half-castes. The capital is Nukualofa, on Tonga Island. Government is administered by a native king, George II. (Jioaji Tubou II.), and a legislative assembly of two houses, the upper composed of 31

hereditary nobles, who hold office during good behavior, and the lower of 31 representatives, elected for 3 years by popular vote. British interests are represented by a deputy commissioner, under the high commissioner and consul-general of the Western Pacific. Currency of Great Britain, Germany, and the United States is legal tender in the islands. The annual revenue, chiefly from customs, the poll tax, land leases, etc., is about \$100,000, which is expended so as to leave a small annual surplus. The principal products are copra, fruits, mats, tapa, combs, and fishing nets. Trade is carried on with Australia and various Pacific islands. The imports in 1899 were valued at £74,124, almost wholly from Australia and New Zealand. The exports amounted to £70,911, mostly to the same countries. Over 90 per cent. of the trade is British. The trade statistics of 1899 show that the islands were recovering from the great drought of 1897, the exports being even larger than for that year. In 1898 the effects of this disaster were seen in a falling off of the exports by over 40 per cent. and imports more than 50 per cent. The United States maintains a consul at Nukualofa.

FRIENDS, SOCIETY OF, a sect of Christians commonly known as Quakers, which has adhered consistently, since its origin in England in the seventeenth century, to a rigid form of discipline that has militated against a numerous membership. The Quakers, about 140,000 in number, are found principally in the United States and Great Britain, though there is a considerable body in Australia, and scattered adherents are found in many other parts of the world. In this country there are some 120,000 Friends, included in the four divisions: Orthodox, 93,204 members, with 1,279 ministers and 830 churches; "Hicksite," 21,992 members, with 115 ministers and 201 churches; "Wilburite," 4,329 members, with 38 ministers and 53 churches; and Primitive, 232 members, with about 10 ministers and churches. District yearly meetings are held regularly, and of recent years efforts have been made among the Orthodox Friends to effect closer association of the yearly meetings by means of a general meeting with definite powers, to be held at intervals of five years, the first of which will convene in 1902. The American Friends' Board of Foreign Missions, organized in 1873, directs its missionary efforts over a wide field, and in educational lines both the Orthodox and "Hicksite" Friends maintain active work, a feature of this department inaugurated in the past few years being the summer schools at Haverford and Swarthmore colleges. In the closing month of the year 1901 a peace conference was held in Philadelphia, the subject being one of common interest to all the various bodies.

FRYE, WILLIAM PIERCE, who became president of the United States senate upon the accession of Vice-President Roosevelt to the presidency, was born at Lewiston, Me., September 2, 1831, and graduated at Bowdoin College in 1850. After studying law and engaging in practice for some years he entered politics, and in 1861 was elected a member of the Maine legislature, to which body he was reelected in 1862 and 1867. In 1866-67 he was mayor of Lewiston, and in 1867-69 was attorney-general of the State. From 1871 to 1881 he was a representative in Congress, and in the latter year he was chosen as one of the United States senators from his State. In 1898 he was chairman of the senate committee of commerce, and was also a member of the Paris peace commission. He has been elected president *pro tempore* of the senate on several occasions, and was president once before, after the death of Vice-President Hobart in 1899. His advocacy of the ship-subsidy bill in the fifty-sixth and fifty-seventh Congresses, and his position as chairman of the committee on foreign relations, have also brought him into recent prominence.

FUKUZAWA, YUKICHI, Japanese educationist, man of letters, and philanthropist, died at Mita, February 3, 1901. He was born in the province of Buzen, in 1834, and after being educated in Chinese, went to Osaka, where he studied Dutch. Going to Yedo (now Tokio) in 1858, he accompanied Katsu Awa to America, and remained there several months, learning English and observing American institutions. Returning to Japan he entered politics, and in 1862 went with the Japanese embassy to Europe to obtain concessions with a view to limiting foreign trade with Japan and to postpone the opening of Japanese seaports until 1868. While in London he acquired a library of English and other books, and in 1866 published a work on *Western Manners and Customs* (*Sei Yo Jijo*), which attained wide popularity and which probably did as much to introduce Western civilization into Japan as any other influence. After a second visit to the United States he became an instructor in the government college at Yedo, and stayed there until the outbreak of the Civil War of 1868. In this year he founded a private school at Tokio, which under his control became one of the most important in the empire, rivaling even the Imperial University. From that time he labored continuously, through his books and a newspaper, the *Jiji Shimpō*, which he controlled, for the reconstruction of Japanese literary style. He wrote on a great variety of subjects, criticising fearlessly old opinions, customs, and traditions. He has been called the intellectual

father of half the young men of Japan. Throughout his career he declined many offers of government positions and titles, preferring to be called "the Great Commoner," by which title he was affectionately known.

FULLER, MELVILLE WESTON, chief justice of the Supreme Court of the United States, was made a member of the International Court of Arbitration in 1901. He was born at Augusta, Me., February 11, 1833, and graduated at Bowdoin College in 1853. After studying law at Harvard he was admitted to the bar in 1855, and established himself in practice at Augusta. For a time he was editor of *The Age*, a Democratic newspaper of Augusta, and in 1856 he removed to Chicago. In 1863-65 he was a member of the Illinois Legislature, and he was four times (1864, 1872, 1876, and 1880) a delegate to the Democratic national conventions. He was appointed chief justice of the Supreme Court in 1888.

FULLER'S EARTH. The production of fuller's earth in 1900 was 9,698 short tons, valued at \$67,535, as against 12,381 short tons, valued at \$79,644, in 1899. There has been a continued decrease in production since 1897, as well as a reduction in the quantity of imports. The latter in 1900 amounted to 8,173 long tons, valued at \$64,799. During 1901 some deposits were found in South Carolina and Virginia, which seem to be fully equal to the English material for bleaching cotton-seed oil.

FULTON, JUSTIN DEWEY, American Baptist clergyman, died at Somerville, Mass., April 16, 1901. He was born at Sherburne, N. Y., March 1, 1828, and graduated at the University of Rochester (1851) and the theological seminary there. Ordained to the ministry at St. Louis in 1854, he occupied pastorates in various cities of the United States and Canada, notably at the Tremont Temple in Boston, 1863-73, and the First Baptist church of Somerville, Mass., from 1894 until his death. Throughout his career Dr. Fulton was an ardent denominationalist and a tireless opponent of the Roman Catholic faith, against the spread of which he wrote and preached with vigor. Some of his works are: *The Roman Catholic Element in American History* (1857); *Witnessing for the Truth; or the Overthrow of the Papacy* (1879); and *Rome in America* (1884).

FUNSTON, FREDERICK, brigadier-general U. S. A., attracted widespread attention during 1901 by his sensational capture of the Filipino rebel leader, Aguinaldo (q.v.), on March 23. He was born in Ohio, November 9, 1865, and was educated at the Kansas State University. In 1890 he began newspaper work at Kansas City, but left it to join a government expedition to the Death Valley in 1891. After two years' experience as a special commissioner to Alaska, 1893-94, he went in 1896 to Cuba, where he served for a year and a half with the insurgent forces and was wounded in action. Returning to the United States in 1898, he was made colonel of the Twentieth Kansas Volunteers and went to the Philippines. For gallantry in action in an engagement at Calumpit he was made brigadier-general of volunteers, May, 1899. In March, 1901, he intercepted certain letters disclosing the whereabouts of Aguinaldo, who was then at Palanan, in the island of Luzon. He organized a party, made up of seventy-five Macabebe scouts who were loyal to the United States, and four American officers, who accompanied the natives ostensibly as prisoners. Reaching Palanan, General Funston directed the Macabebes to notify Aguinaldo that they brought five American soldiers as captives, and to request the Filipino chief to receive them. When the party gained entrance to Aguinaldo's quarters, General Funston led the attack on the defending Tagalog force, routed it, and captured the leader. Marching Aguinaldo to Palanan Bay, General Funston put him aboard the U. S. gunboat *Vicksburg* and delivered him to the American authorities at Manila. For this service he was, on March 30, made brigadier-general in the regular army. While this exploit undoubtedly has had the effect of decreasing the resistance of the rebel forces in the Philippines, it has subjected General Funston to severe criticism for the method adopted by him.

GALEATI, SEBASTIAN, Roman Catholic cardinal, died at Ravenna, January 25, 1901. He was born at Imola, Italy, February 8, 1822, and was created a cardinal priest and archbishop of Ravenna in 1890.

GALLOWAY, Tenth Earl of, **ALAN PLANTAGENET STEWART**, died at Cumloden, February 7, 1901. He was born in London, October 21, 1835. He served in the Royal Horse Guards (1855-69), resigning with the rank of captain, and was a member of Parliament for Wigtownshire from 1863 to 1873, when he succeeded to the peerage. He was a Conservative in politics, and in 1876 and 1877 was appointed by Lord Beaconsfield high commissioner to the general assembly of the Church of Scotland.

GALT, Sir THOMAS, chief justice of the Canadian court of common pleas, died at Toronto, June 1, 1901. He was born in London, England, August 17, 1815; was educated in England and Scotland; and went to Canada at the age of eighteen. He was admitted to the Toronto bar in 1845, and took high rank as a criminal lawyer

before he was raised to the bench in 1869. He was chosen chief justice of the court of common pleas in 1887 and was knighted in 1888, six years before his retirement from the bench.

GAMBIA, the oldest British colony in Africa, lies on both banks of the Gambia River, extending from the coast into the interior about 200 miles. The original area of the colony proper was about 69 square miles; but in 1901, according to an agreement with the native chief, Mousa Mollah, an addition was made to the British territory, which now extends back to the French frontier. The entire present area of the colony is about 3,550 square miles. The population is estimated at 250,000. The country is governed by an administrator, with executive and legislative councils. The administrator in 1901 was Sir G. C. Duncan. The revenue of 1900 was the largest on record, amounting to £49,160, of which about four-fifths were represented by customs duties. The expenditure was £29,817; there was no public debt and the assets of the colony exceeded the liabilities. The imports in 1899 amounted to £240,906; in 1900, to £194,408. The exports for 1899 were valued at £241,936, and in 1900 at £240,705. The rubber industry has fallen off, and trade now depends almost wholly on the ground-nut crop.

In January, 1901, an expedition under Lieutenant-Colonel Brake set forth to punish the native tribes who had murdered two British traveling commissioners, Messrs. Sitwell and Silva, at Sankandi in the previous June. The expedition took the towns of Dumbutu (January 11) and Kwinella (January 12), and captured the principal leaders; and on May 9 three natives, convicted of complicity in the murder, were hanged. There was also disaffection in other districts, and the turbulent natives fled across the border into Senegal. A combined force of French and English attacked the chief, Fodi Kabbah, at his stronghold, Mandina, and took the town (March 23). The chief was killed, and the explosion of two magazines in the town caused the death of forty of his wives.

GARNETS. See **GEMS**.

GAS, ILLUMINATING AND FUEL. The number of gas works in the United States in 1900, according to Bulletin 123 of the Twelfth Census, was 877, located in 827 different cities and towns. Of the 877 works, 15, located in 15 municipalities, were owned by the city or town, and the remainder by private corporations. The combined capital of these 877 establishments amounts to about \$567,000,000, or an average of about \$646,500 per establishment. The average product in 1900 was 76,503,482 cubic feet of gas against 49,217,670 cubic feet in 1890. In the table given below the location of these plants is summarized by States. The price per thousand cubic feet ranges from \$4.50 in Nevada to 83.2 cents in the coal regions of Pennsylvania, the average price being \$1.035. In 1890 the average price was \$1.42. It is interesting to note that over 27 per cent. of the total amount of gas consumed was used in the city of New York, where the average price during 1900 was \$.905 per thousand cubic feet. Although it has been nearly a century since gas was first used in the United States, the growth of the industry was at first very slow, and as late as 1830 there were not more than a half dozen plants in operation, and for the census of 1850 reports were received from only 30 establishments. In 1860 221 establishments, having a combined capital of \$28,848,726, were reported; in 1870 the number had increased to 390, having a combined capital of \$71,773,694; and in 1890 to 742 plants, with a capital of \$258,771,795. Since 1890 there has been a development of one branch of the industry which is likely to have an important influence upon the future of gas manufacture. This is the coke-oven process, in which gas is a by-product. The increased use of water gas, also, has been far-reaching in its effects upon the gas industry. Water gas is made by a process in which hydrogen and the oxide of carbon, produced by the action of steam upon carbon at a high temperature, are mixed and then combined with richly carburetted gasses, usually from petroleum, thus producing the power of illumination. Water gas was first made in 1873. For many years it was bitterly opposed by the coal-gas manufacturers, but the opposition has gradually died out, and now many coal-gas makers have adopted the water-gas processes. It is estimated that fully 75 per cent. of all the gas now used is water gas. The sanitary aspects of this change from coal gas to water gas are discussed farther on.

Although the use of gas has increased 86.9 per cent. during the last decade of the century, the use of electricity for illuminating purposes has undoubtedly increased at a much more rapid rate, and has not only prevented the erection of new gas plants, but has been one of the causes of the dismantling of nearly 50 establishments during the decade. Of the 877 gas plants reported in the last census, 269, or 31 per cent., were operated in connection with the generation of electricity, and it was reported in many cases that the production of gas was attended with actual loss. The effect of electric lighting in checking the growth of the gas industry has been counteracted in part by the introduction of the Welsbach burner. This burner, or

incandescent mantle—named from its inventor, Auer von Welsbach, of Austria—produces an illuminating power of 20 candles per cubic foot. Other factors which have promoted the growth of the gas industry are the use of gas stoves for cooking and heating purposes, and also the increased popularity of the gas engine.

The names of the municipalities in which the fifteen publicly owned gas plants are located are, unfortunately, not given, but they are located as follows: Kentucky, 1; Massachusetts, 3; Michigan, 1; Minnesota, 1; Missouri, 1; Nebraska, 1; Ohio, 2; Virginia, 4; West Virginia, 1. Four of these plants are in cities having a population of more than 30,000. The following statistics concerning these four plants are taken from the *Bulletin* of the Department of Labor, issued in September, 1901, on statistics of cities:

NAME OF CITY.	Date works were built.	Date works were bought by city.	Miles of mains.	Cost.
Toledo, O.....	1891	(Built by city.)	98	\$1,180,000
Richmond, Va.....	1860	1861	78.8	961,181
Duluth, Minn.....	1896	1898	31.48	389,993
Wheeling, W. Va.....	1860	1875	40	409,716

Comparative summary of gas plants in operation in 1900 and 1890, from bulletin 123 of the twelfth census:

Sanitary Aspects.—Within recent years, and particularly during the last eighteen months, much attention has been given, both by sanitarians and by those interested in gas manufacture, to the sanitary aspects of the use of illuminating gas. The importance of this phase of the subject has been increased by recent changes in methods of gas manufacture and by the substitution of water gas for coal gas in many of our large cities. In water gas the most poisonous agent, carbonic oxide, is thereby increased from 6 or 7 per cent. to about 30 per cent. This change, however, was not necessary to make illuminating gas an active poison to breathe. The danger in the use of illuminating gas arises from two sources: (1) From unburned gas which escapes into the atmosphere through defective mains or fixtures or through burners accidentally open; and (2) from vitiation of the atmosphere by the products of burning gas. The first danger, that from leaking gas, was forcibly explained in a paper read by Dr. Durgin, health officer for Boston, before the New Jersey Association, and published in 1901 in the twenty-seventh annual report of the association. The subject was also discussed by William Paul Gerhard in an article first published in *Cassier's Magazine* and republished in pamphlet form. The National Board of Fire Underwriters, in a circular on *Gas Main Leakage Under Impervious Street Pavements*, furnishes a table of gas losses compiled from data furnished by fifteen companies, which shows that over 14 per cent. of the total product of gas plants leaks into the streets and houses of the cities supplied. Regarding the danger from gas thus lost, the report goes on to say: "Always a serious matter as affecting life and property, the evil is emphasized in many ways by the substitution of impervious pavements for the loose stone pavements of former times. Generally speaking, any pavement which is water-tight is practically gas-tight. The leakage of gas mains, which formerly worked itself to the surface and escaped into the air, too diluted to be dangerous, now follows the path of least resistance, which usually terminates in coal cellars and basements. Some of it gets into sewers and subways, as is shown by the comparatively frequent street explosions due to accidental or electrical firing. Nine such explosions occurred in one day in New York in the winter of 1900-01." The danger to houses from escaping gas is much greater in the winter time, when the street surface is frozen, and when houses, on account of their higher temperature, act as chimneys to draw in the ground air, and with it the gas which has leaked into the soil. Gas thus escaping may follow water or sewer pipes and enter even those houses which have no gas connection. The late Professor von Pettenkoffer relates a great number of instances where entire families have during the night been asphyxiated by gas entering the house in this manner.

The danger from defective gas plumbing within the house was pointed out in Dr. Durgin's paper. He gives several instances which came under his personal observation of whole families stricken with illness which was traced indubitably to defective gas plumbing, and adds: "From like sources I have been gathering material for some time, and shall, in a future report on the subject, be able to give data showing the extent to which tenants are made ill by illuminating gas which escapes in small quantities from faulty pipes and fixtures. I am, however, prepared to state my convictions, in advance of further data, that a faulty and leaky condition of gas pipes and fixtures within our dwellings, counting-rooms, and other inclosed spaces, is extremely common, and is without doubt the cause of much discomfort and illness, and that such ill effects are a hundredfold greater than has ever been caused by so-called sewer gas. If you should examine specimens of gas-pipe and gas fixtures which are to be found in the market and which are being used, you would find piping too thin to bear a respectable thread for connecting purposes, and you would find cocks and other fittings too light and otherwise faulty to be trusted for ordinary use. The cement in use for stopping leaks and sealing joints is readily dissolved in illuminating gas, and should be substituted by white or red lead." Dr. Durgin further states that in 1897 the legislature of Massachusetts passed an act intended to safeguard the people against the danger arising from poor material and workmanship in the matter of gas fitting. The act, among other things, requires gas plumbers to secure a license, which can be obtained only upon certain conditions and is subject to forfeiture. It also authorizes inspection of gas plumbing. Under the provisions of this act an inspection of different blocks in the city of Boston was inaugurated, and it was found that 80 per cent. of the houses inspected, both new and old, showed from 2 to 10 leaks.

In the *Medical Record* for February 24, 1900, it was stated that Dr. Haldane, one of the British departmental committee appointed to inquire into the manufacture and use of water and other gases containing a large proportion of carbon monoxide, pointed out that in the case of Boston, where 90 per cent. of the gas is water gas, about one in every 300 deaths is due to accidental gas poisoning, and the committee resolved that they would not allow in Great Britain more than 12 per cent. of carbon monoxide in illuminating gas. In order to remove the constant menace to life and property, through explosions and asphyxiation, which is afforded by leaky gas mains, the whole matter should be under the strictest public surveillance and control. The introduction, in our large cities, of subways for underground pipes and wires would remedy the evil by rendering gas mains easily accessible for constant inspection. In this way the slightest leak would be detected. There would also be removed the danger of deterioration of the mains through rust, and of their breakage through settlement of the soil. The hygienic aspects of gas consumption, a perfect distribution system being taken for granted, were discussed at the twenty-third annual meeting of the Western Gas Association, in May, 1900, by Thomas D. Miller, and at the twenty-fourth annual meeting of the same association, in May, 1901, by Jos. Ferrier. While it was conceded by both these gentlemen that the consumption of gas does vitiate the atmosphere of a room to a certain extent, it was shown that an ideal system of ventilation is possible to which burning gas is not a hindrance but an essential part. An example of such a system is found in the British House of Parliament, where, by means of flues placed over the jets, the heat or surplus energy of the gas flame assists in producing a pure atmosphere. Mr. Ferrier stated that at Brussels M. Bandsept had shown that a similar system of ventilation could be carried on with a 13-foot ceiling, in conjunction with the chimney of the room, and that Warrington, of England, had demonstrated that the combustion of one cubic foot of gas could be made by a suitable flue to change the atmosphere of a room 15 x 15 x 11 feet once per hour. In this event the 3 feet per hour consumed by an incandescent gas burner could be made abundantly to light and ventilate that space. Mr. Miller further attempted to show that the atmosphere of a room is actually improved by passing through a gas flame, but the contention was not sustained by the discussion which followed his paper. He said: "The dark spot on the ceiling which gradually appears and grows darker over a gas jet is ordinarily attributed to smoke from the gas, but such is not the case. These sooty deposits are nothing less than charred and inert particles of organic matter that have passed through the gas jet, and, rising with the current of hot air, have been deposited on the ceiling; and it is impossible to say how many millions of deadly disease germs are hourly cremated in this way." The character of light best adapted to the human vision was discussed by both gentlemen. Referring to the harm which the eyes suffer from a brilliantly lighted desk or table in an otherwise dark room, Mr. Miller said: "The result is constant contraction and expansion of the eye, which, if persisted in, will eventually result in nervous prostrations of its muscles, with accompanying evils. . . . I believe that nature is the greatest scientist of all, and she has provided every protection and shading of the eyes on the hypothesis that light comes from above; therefore we have longer eyelashes on the upper lid than on the lower, and most of us have heavy eyebrows, so the light shall not come from a level with the eye, but from above it in all cases." See ELECTROLYSIS OF GAS AND WATER PIPES.

GAS, NATURAL. See NATURAL GAS.

GASTERINE. In 1900 Le Gendre, of Paris, first suggested the use of the gastric juice of the dog in therapeutics. Frémont, of Vichy, prepared the drug for actual use, and gave it the name gasterine. In 1901 Le Gendre reported success with it in chronic dyspepsia with apepsia, in ordinary prolonged cases of gastritis, in post-operative indigestion, in vomiting of pregnancy, and in entero-colitis. Sarrade and Daudet employed it successfully in cases of hepatitis, and Rendu and Frémont also testify to its efficacy in various forms of indigestion. Albert Mathieu and Laboulais found gasterine useful in hypochlorhydria, whether neurasthenic or not. They found from 3 to 3.5 grammes of free hydrochloric acid to the thousand in gasterine. They consider that it acts principally by stimulating the pancreatic secretion. The ordinary dose is from 4 to 6 tablespoonfuls daily.

GEMS. The value of the gems produced in the United States in 1900 was \$233,170, as compared with \$185,770 in 1899. Among these may be mentioned: Diamonds, \$150; sapphires, \$75,000; rubies, \$3,000; garnets, \$500; Amazon stone, \$250; emeralds, \$4,000; beryl, \$11,000; quartz crystal, \$10,000; pyrope, \$1,000; turquoise, \$82,000. The imports of diamonds were valued at \$13,561,588, of which \$7,803,066 were unset and \$3,658,545 were rough or uncut. The following particulars are given by the United States Geological Survey, in the *Mineral Resources of the United States* for 1900: The locality of fine blue sapphires in Fergus county, Mont.,

continued to produce, and there was a development of fancy-colored sapphires in the same State. The turquoises, instead of being cut alone, were cut with the rock or matrix in which they occur, and the material sold under the name of "turquoise matrix." The same was done with the emeralds from western North Carolina, which were put on the market under the name of "emerald matrix." Purple garnets were found in Macon county, N. C., and a new locality was discovered for colored tourmalines in California. Two diamonds were found in Tennessee, one of them weighing 1 13-16 carats. Another was found in Indiana of $4\frac{3}{4}$ carats, and one in Shelby county, Ala., weighing $4\frac{1}{4}$ carats. The Boer war in South Africa, however, interfered with the DeBeers mines and stopped their yield for nearly six months. Aside from this, there has been a gradual falling off in the production of these mines for the last few years and a great advance in the price of diamonds a carat. Thus, in 1899 diamonds were sold at 29s. 7.2d., and in 1900 at 35s. 10.2d. The main rock shaft at the Kimberley mine is now down 2,133 feet, and the lowest working level is at 1,840 feet. A number of diamonds were obtained in 1900 from a point about 250 miles south of Bartica, in British Guiana. There was also an increase in the price of carbon diamonds (which are used to set in boring tools), due to a corner in the market on these materials and the interruption of the bort mining in the Transvaal. On this account their cost has risen from \$16 to \$75 a carat, and the expense of diamond drilling from \$1.50 to \$4 a foot. The year 1900 also saw the reopening of the Burma ruby mines, which followed the reorganization of the company operating the same. These mines produce at least one-half of the world's production of rubies.

O. A. Derby (*American Journal of Science*, January, 1901, fourth series, xi., p. 25) gives an account of the mode of occurrence of topaz near Ouro Preto, Brazil. He believes the topaz to be the original constituent of the metamorphosed and decomposed igneous rock in which it is found. According to G. F. Kunz (*Engineering and Mining Journal*), the domestic production and the exports and imports of precious stones in the United States were greater in 1901 than in any other year. W. H. Holmes (*American Anthropologist*, 2, No. 3, July to September, 1900, p. 405) describes the great obsidian mines in the State of Hidalgo, Mexico. These were operated in prehistoric times and furnished employment for the population of the entire southwestern part of this country.

GEOGRAPHICAL PROCESS. See AFRICA; ANTARCTIC EXPLORATION; ARCTIC EXPLORATION; HEDIN; SVEN.

GEOGRAPHICAL SOCIETY, NATIONAL, an organization formed in 1888 by the majority of the active contributors to geographical science assembled at the national capital, having for its object the increase and diffusion of geographical knowledge. The society presents the principal results of geographical exploration and research, and affords writers at Washington opportunities for the publication of information in other than technical reports. The society publishes the *National Geographic Magazine*, an illustrated monthly, and holds an annual course of lectures, which has come to be an important feature of the intellectual life of Washington. It has aided and encouraged various expeditions, and offered prizes for essays on designated appropriate subjects. In 1901 the membership of the society was 2,487. President, Dr. Alexander Graham Bell.

GEOGRAPHIC NAMES, U. S. BOARD ON, created by President Harrison in 1890, is comprised of 12 members, representing the various government departments, bureaus, etc., and is an authority on all questions concerning geographical names. In March, 1901, the board published a second edition of its *Second Annual Report*, which contains all its decisions down to that date. In May, 1900, a special report on Philippine names was issued, and later a dictionary of Alaskan names.

GEOLOGICAL SURVEYS. During the year 1901 a geological survey was started in the State of Texas, under the provisions of an act of the State legislature passed in March. The terms of this act permitted the making of a mineral survey of the lands belonging to the public schools, university, or asylums of the State of Texas. The new survey is under control of the board of regents of the University of Texas, and has begun work in a most active manner. It has already issued a report on the Beaumont oil district of Texas, and is at present engaged in an investigation of the newly developed mercury districts of the same State. During 1901 the U. S. Geological Survey issued portions of its *Twenty-first Annual Report*, and the volume on *Mineral Resources* for 1900. Among other geological reports may be mentioned: Iowa Geological Survey Report (vol. 12), containing county reports; that of the Maryland Geological Survey, with report on the Eocene deposits of that State; New Jersey Geological Survey Report for 1900, with various papers, especially one on the Portland cement deposits of New Jersey; Indiana Department of Geology and Natural Resources, *Twenty-fifth Annual Report*, de-

voted chiefly to the limestones used for cement manufacture and the marl deposits of that State; Arkansas Geological Survey, report on lead and zinc deposits; Wisconsin Geological Survey, *Bulletin on the Clay Deposits of Wisconsin*; Texas Geological Survey, *Bulletin on Beaumont Oil Fields*; New York State Museum, *Bulletin on Geology of Niagara Falls*; Minnesota Geological Survey, geological atlas to accompany final report.

GEOLOGY. At the meeting of the American Association for the Advancement of Science held in Denver in August, 1901, Professor T. C. Chamberlin presented a paper entitled *On Some Studies Relative to Primal Questions in Geology*, in which he expresses the opinion that the nebular hypothesis as formulated by Laplace is inadequate to explain some known phenomena in geology and astronomy, and is led by the consideration of the loss of mass and momentum to the conclusion that "some system may have resulted from a gaseous or nebular mass getting within the attraction of a solid body in such a way as to become torn asunder into separate fragments. Vortical motion would ensue in the different parts of the system and produce the planets. This line of investigation points to the formation of the planets by the slow aggregation and solidification of attenuated matter without the production of the extremely high temperatures which have heretofore been supposed inevitable." Bailey Willis, in a paper on *Individuals of Stratigraphic Classification*, in the *Journal of Geology* (vol. 9, p. 587), discusses the unit to be used in geologic mapping, and concludes that the lithologic characters should be first considered and mapped, but that this should be supplemented by a consideration of the faunal details of the formations plotted and their distribution in stages; for, as he points out, the lithologic characters cannot always be safely used as a basis of classification. J. E. Spurr, in the *Bulletin of the Geological Society of America*, states his belief that the basin ranges owe their external form to long-continued erosion of rocks, which have been folded and faulted by a number of movements, and that it is only in rare cases that the present topography is a direct expression of folding and faulting. G. F. Becker, in a *Report of the Geology of the Philippine Islands* (21st Annual Report, U. S. Geological Survey), gives a résumé of what is known regarding the geology of these islands, and also adds some observations of his own. The following may be mentioned among the papers which have been published during the past year: A. W. Grabau, *Guide to the Geology and Paleontology of Niagara Falls and Vicinity* (*Bulletin* New York State Museum, vol. 9, No. 45, p. 234); L. F. Ward, *Geology of the Little Colorado Valley* (*American Journal of Science*, 4th series, No. 12, p. 401); W. B. Clark and G. C. Martin, *The Eocene Deposits of Maryland* (vol. on Eocene, Maryland Geol. Survey, 1901); C. N. Gould, *Notes on the Geology of Parts of the Seminole, Creek, Cherokee, and Osage Nations* (*American Journal of Science*, 4th series, No. 11, p. 185); *Outline of the Geology of Japan* (published by the Geol. Survey of Japan, Tokio, 1900); G. M. Dawson, *Geological Report on the Rocky Mountains Region in Canada* (*Bulletin of the Geological Society of America*, No. 12, p. 57); S. Weller and H. B. Kummel, *Paleozoic Limestone of the Kittatinny Valley, New Jersey* (*Bulletin of the Geological Society of America*, No. 12, p. 147).

Vertebrate Paleontology.—G. W. Andrews (*Extinct Egyptian Vertebrates*, *Geological Magazine*, p. 400, 1901) describes the discovery of a number of interesting types in the western desert of Egypt. It is claimed that the importance of these discoveries is that they will show that Africa was the home of many families of mammals, such as elephants, hippopotami, giraffes, etc., which suddenly appeared in Europe without known ancestry. H. F. Osborn, in a paper entitled *Reconsideration of the Evidence for the Dinosaur-avian Stem of the Permian* (*American Naturalist*, No. 34, p. 777), discusses evidence bearing on this point. The same author, in a paper on the *Phylogeny of the Rhinoceroses of Europe* (*Bulletin* American Museum Natural History, vol. 13, art. 19, p. 220), divides the rhinocerotidæ into six phyla, having no known relation to each other, and traceable back to their stem forms in the early Cenozoic. Lucas reports the finding, in the Triassic of Arizona, of belodont and dinosaur bones; also fragments of a very large labyrinthodont. Among the other discoveries may be mentioned one by C. H. Sternberg of a fine skeleton of a new plesiosaur in the Kansas chalk, and another skeleton 16 feet long of *Portheus*, a predaceous fish. The paleontological expedition sent out by the Field Columbian Museum (Chicago) has found a number of dinosaur bones which belong probably to an animal of this family larger than any other known. One of the ribs measured more than 9 feet in length, while the femur is 80 inches long, which is 6 inches longer than that of Marsh's *Atlantosaurus*. J. S. Kingsley presents a paper on the *Origin of Mammals in Science* (N. S., August 9, 1901).

Paleontology.—G. Lindström, in a paper on the *Researches on the Visual Organs of the Trilobites*, points out that many species are lacking in eyes which were considered to have them, and announces that he has found true eyes on the hypostomes of many species. C. E. Beecher, in a paper on the *Discovery of Eurypterid Remains*

in the Cambrian of Missouri (*American Journal of Science*, 4th series, No. 12, p. 365), in announcing the discovery of a new genus from this formation, extends the known range in time of these crustaceans. Until recently the eurypterids have hitherto been confined almost exclusively to the Waterlime rock, but recently J. M. Clarke has also found them at the base of the Salina. Among other paleontological papers which have been recently published may be mentioned the following: F. Huehne, *Beiträge zur Beurtheilung der Brachiopoden* (Centralblatt für Mineralogie, 1901).

Petrography.—Weed and Pirsson have examined a very interesting group of laccoliths in the Highwood Mountains of Montana (*Geology of the Shonkin Sag Palisade Butte, Laccoliths in the Highwood Mountains of Montana, American Journal of Science*, 4th series, vol. 12, p. 1). It was found by these investigators that during intrusion there was a curious concentration and differentiation in the magma, so that the laccoliths are made up of shells of different rock types. A. A. Julien, in a paper on the *Study of Structure of Fulgurites* (*Journal of Geology*, No. 9, p. 673), shows that considerable variation appears in these structures, and that this difference is probably due to variations in the volume, intensity, and duration of the electric currents which pass through the rock. H. S. Washington finds, in studying Glaucophane schists from different localities (*A Chemical Study of the Glaucophane Schists, American Journal of Science*, 4th series, vol. 11, p. 35), that they belong to a basic or main group and an acid group which is of secondary importance. Among the other papers on petrography which have been issued during 1901 may be mentioned: J. E. Spurr, *Variations in the Texture of Certain Tertiary Igneous Rocks of the Great Basin* (*Journal of Geology*, vol. 9, p. 587); W. O. Crosby, *Geology of the Boston Basin* (vol. 1, part 3), Boston Society Natural History, *Occasional Papers* (iv., 289-694); W. G. Miller, on *Some Newly Discovered Areas of Nepheline Syenite of Central Canada* (*American Geologist*, vol. 27, p. 21); T. L. Watson, *Granitic Rocks of Georgia and their Relationships* (*American Geologist*, No. 27, p. 199); A. N. Winchell, *Study of the Gabbroid Rocks of Minnesota* (*American Geologist*, 1901); E. Ordenez, *The Rhyolites of Mexico*, 1st part (*Bulletin of the Mexico Geol. Institute*, No. 4, p. 175). This is the first part of the detailed study of the Mexican volcanic rocks.

•**Physical Geology.**—O. Fischer, in a paper on *The Rival Theories of Cosmology* (*American Journal of Science*, 4th series, vol. 11, p. 414), compares the nebular hypothesis of the origin of the earth and the accretionary theory recently advanced by Chamberlin. Hill believes that the Texas coastal plain from the Trinity River to the mouth of the Colorado is rising. The effect of this is to form very slight valleys or wrinkles in the strata of this area. One of these is Danon's Mound in Brazoria County, which Hill believes to have a quaquaversal dip. Fairchild points out that the Medina sandstone is a shallow-water deposit, and certain structures found in it are not giant ripples formed in the deep ocean, as put forth by Gilbert in the *Bulletin of the Geological Society of America*. Shattuck, in studying the coastal plain of America (*The Pleistocene Problem of the North Atlantic Coastal Plain, American Geologist*, No. 28, p. 87), finds that there are five different shore lines representing different levels of the ocean during an earlier depression of the coastal region, and that these are accompanied by wave-cut and wave-built terraces, bars, etc.; the uppermost terrace is 300-500 feet above the present sea level, while the lowest is the present shore line. J. E. Tallmadge (*Science*, new series, vol. 13, p. 550) records the occurrence of a recent movement along a minor fault plane at the mouth of Ogden Canyon, Utah. A crack was opened in the mass of gneiss, through which a water-power tunnel had been cut, fracturing the walls of the tunnel and allowing the water to escape on the mountain side at depths of 50 to 150 feet below the tunnel floor. During the retreat of the ice sheet from the Lake Superior and Red River districts, a number of glacial lakes were formed. N. H. Winchell, in the *Bulletin of the Geological Society of America*, has described 26 of these from Minnesota. Lake Agassiz is the best known, and was much larger than any of the others. H. Arctowski, in an account of the Antarctic voyage of the Belgica, during 1897-99, shows that in Tierra del Fuego, there are well-marked traces of the former extension of glaciers. Moraines were seen at various points along Belgica Strait, between Dando Land and outlying islands. One of these, at Cape Reclus, indicated a former mer-de-glacé ten miles wide and 342 fathoms deep. An immense glacier must also have flowed westward through Belgica Strait toward the Pacific Ocean. (*Journal of Geology*, vol. 17, No. 353.) Glacial geologists have often sought in the eastern States for good evidence of the existence of more than one advance of the ice during the glacial period, and during the past year M. Fuller has found evidences of the older till underlying one of later age in the region around Dedham, south of Boston. (*Probable Representatives of Upper Wisconsin Till in Southeastern Massachusetts, Journal of Geology*, vol. 9, p. 311.) Among other papers in physical geology may be mentioned: W. H. Hobbs, *The River System of Connecti-*

cut (Journal of Geology, September to October, 1901); W. T. Smith, *A Topographic Study of the Islands of Southern California* (Bulletin, Department of Geology, University of California, Vol. 2, p. 179); R. A. Daly, *The Physiography of Acadia* (Bulletin, Museum of Comparative Zoology, xxxviii., Geology Series, Vol. 5, No. 5, p. 73). The following books on geology appeared during 1901: Sir A. Geikie, *The Founders of Geology*, Baltimore; A. P. Brigham, *A Text-book of Geology*, New York; H. G. Seeley, *Dragons of the Air: An Account of Extinct Flying Reptiles*, London; G. H. Barton, *Outline of Elementary Lithology*, Boston; C. R. Dryer, *Lessons in Physical Geography*, New York; R. E. Dodge, *A Reader in Physical Geography*, New York; G. Walther, *Das Gesetz der Wustenbildung in Gegenwart und Vorzeit*.

GEORGETOWN UNIVERSITY, a Jesuit institution, Washington, D. C., founded 1789, consists of the college, school of medicine (which, beginning 1901, includes a school of dental surgery), and school of law. In 1901 the faculty consisted of 109 professors and instructors, and the student-body of 546, deducting 19 duplicated, matriculated, as follows: College, 166, of whom 142 were undergraduates and 24 graduates; medical, 123; law, 276. Connected with the university is the Georgetown Preparatory School, which prepares students for the college. Their class rooms are situated in the main building of the college, but the students are kept apart from the college men and their dormitories, study hall, play-ground, etc., are entirely separate. A site has already been secured, and it is hoped that the preparatory school will soon possess a building of its own. The system of discipline is one of the features of the university. The college is considered a large family. The professors live with the students, mingle with them constantly, and personally direct their studies. The chief needs are a gymnasium and swimming pool; the completion of the equipment of the observatory; endowments for scholarships, and liquidation of the debt of the university free hospital.

GEORGIA, a southeastern State of the United States, has an area of 59,475 square miles. The capital is Atlanta. Georgia is one of the original thirteen States. The population in 1900 was 2,216,331, while in June, 1901, as estimated by the government actuary, it was 2,258,000. The populations of the three larger cities in 1900 were: Atlanta, 89,872; Savannah, 54,244, and Augusta, 39,441.

Finances.—At the beginning of the fiscal year ended September 30, 1901, the balance in the treasury was \$416,146.30. The receipts during the year 1900-1901 were \$3,804,195.73, making a total of \$4,220,342.03. Expenditures during the year amounted to \$3,489,619.93, leaving a balance on hand October 1, 1901, of \$730,722.10. The total State debt on the same date was \$7,826,202, of which \$7,736,000 was bonded. The difference (\$90,202) is known as the "land script fund," on which the State pays the university trustees annually 7 per cent. interest. A novelty for Georgia was the placing of a loan of \$200,000 with State banks only. It was obtained at the lowest rate of interest ever paid by this or any other State—2 per cent.

Industries.—Although Georgia is an agricultural State, there has been a rapid growth in its manufacturing and mechanical industries during the last half century, and especially during the last decade. It appears from the census returns that while from 1850 to 1900 the population increased from 906,185 to 2,216,331, or 144.6 per cent., the average number of industrial employees during the same period increased from 8,368 to 83,842, or 901.9 per cent. In 1850 the gross value of manufactured products was \$7,082,075; in 1890 it was \$68,917,020, and in 1900 it was \$106,645,527. If from the gross value of all manufactured products is subtracted the value of those re-used in manufacture, the true net value of products manufactured in Georgia in 1900 is found to be \$78,154,611. At the same time the amount of money invested in manufacturing industries, exclusive of capital stock, was \$89,789,656, 7,504 establishments reporting. As cotton is the principal crop of the State, so manufactures depending on it have the greatest value, aggregating \$26,609,022 in 1900. Of this total the cotton goods industry gave \$18,544,910, and the manufacture of cottonseed oil and cake, \$8,064,112. Products from the extensive pine forests of Georgia rank next in value to the cotton manufactures, having in 1900 a value of \$21,815,391, including rosin and turpentine products. By a proper system of forest preservation it is stated that this industry might be largely increased in value. But the destructive methods employed would seem to destine it to early extinction. Of other industries, may be mentioned flour and grist milling, whose products were valued in 1900 at \$8,330,439, as against \$5,190,311 in 1890; planing manufactures, valued at \$4,302,976; foundry and machine shop products, valued at \$3,506,427; railroad repairing and construction, valued at \$3,062,283, and the manufacture of fertilizers, valued at \$3,367,353. Atlanta, Augusta, Macon, and Savannah are the leading manufacturing cities. Atlanta, holding first place, increased the value of her products during the decade by 27.9 per cent., having in 1900 a production valued at \$16,721,899.

State Officers.—Governor, Allen D. Chandler, Democrat, elected for two years, term expires November 1, 1902; secretary of state, Philip Cook; comptroller, William A. Wright; treasurer, Robert E. Park; attorney-general, J. M. Terrell; adjutant-general, P. G. Bird; commissioner of agriculture, O. B. Stevens; superintendent of education, G. R. Glenn; insurance commissioner, W. A. Wright; chief justice of the Supreme Court, Thomas J. Simmons, term six years, expires in October 1904; associate justices, Samuel Lumpkin, Henry T. Lewis, Andrew J. Cobb, William A. Little, and William H. Fish—all Democrats.

Congressional Representatives (57th Congress).—In the House: Rufus E. Lester, of Savannah; James M. Griggs, of Dawson; Elijah B. Lewis, of Montezuma; William C. Adamson, of Carrollton; Leonidas F. Livingston, of Kings; Charles L. Bartlett, of Macon; John W. Maddox, of Rome; William M. Howard, of Lexington; Farish C. Tate, of Jasper; William H. Fleming, of Augusta; William G. Brantley, of Brunswick—all Democrats. In the Senate: Alexander S. Clay (until 1903), of Marietta, and Augustus O. Bacon (until 1907), of Macon—both Democrats.

GERMAN BAPTISTS. See DUNKARDS.

GERMAN EAST AFRICA. See EAST AFRICA, GERMAN.

GERMAN EVANGELICAL SYNOD OF NORTH AMERICA, organized in 1840, a result of a union of Lutheran and Reformed elements, is a type of the State Church of Prussia. It has (1901) in its 17 districts, 203,281 members, with 922 ministers and 1,153 churches; and 964 Sunday schools, with 10,202 officers and teachers and 100,649 scholars. The church numbers among its activities a progressive educational work; home missions, a feature of this department being an emigrant and harbor mission in Baltimore, Md.; foreign missionary work, including, in India, 4 stations and 8 missionaries; and a publishing house at St. Louis, Mo. The report of the treasurer of the synod shows for the years 1899-1901 total receipts of \$205,485 and expenditures of \$182,101, the balance, when applied to the existing debt, leaving one of only about \$16,500. Besides this account, to the specialized departments of work certain sums were devoted. These include about \$75,000 for educational work, \$36,000 for charitable enterprises, \$45,000 for home missions, and nearly \$60,000 for foreign missions. Officers of the German Evangelical Synod: President, Rev. J. Pister; secretary, Rev. E. Fuhrmann, 404 Lafayette Street, Newark, N. J.; treasurer, Rev. L. Kohlmann.

GERMAN LITERATURE. *History and Biography.*—As a general rule, the historical works which emanate from Germany share to so large an extent the ponderous dullness of their legal, theological, or scientific treatise, and possess so little of that vital quality which makes a volume readable, that it is difficult to decide just where the line should be drawn in a survey of the year's progress in literature. It is at least clear that the works of this class stand too far outside of the current literary movement to be significant, in the sense that the new fiction and drama are significant, of the prevailing intellectual tendencies in literature. Now and then, however, we find a historian who plainly seeks to combine a high degree of scholarship with a style which shall be attractive to the general public. A good example of this is Otto Seeck's *Geschichte des Untergangs der antiken Welt*, the second volume of which has just appeared, after an interval of four years. The distinguishing attitude of the work is its tendency to disparage Hellenism and to hold that the only products of that period which had enduring worth were the outcome of the Semitic spirit. An interesting contrast in more ways than one is offered by a comprehensive work by Julius Kaerst, *Geschichte des Hellenistischen Zeitalters*, the first volume of which has recently appeared. Of documentary history, *Quellen, Forschungen, and Untersuchungen*, issued from official sources or published by the various historical societies, there seems to be no end. There appeared in 1901, among others, the third volume of *Quellen zur Geschichte des Hauses Hohenzollern*; the fourth volume of *Quellen zur Geschichte der Stadt Wien*; Vol. VIII. of the *Quellen zur Geschichte, Litteratur und Sprache Oesterreichs und seiner Kronländer*; Vol. XX of the *Quellen zur Schweizer Geschichte*, and other similar series too numerous to chronicle. Of a somewhat analogous character is the history of *Die Kriege Friedrichs des Grossen*, the latest volumes of which cover the Seven Years' War. Of mingled historical and biographical interest are *Kaiser Friedrichs Tagebücher*, edited by M. von Poschinger, and covering the wars of 1866 and 1870-71, and the emperor's travels in the East and in Spain. Another volume of war-time memoirs of considerable importance bears the title, *Im Hauptquartier der II. Armee, 1866*, and is written by the Prussian general, Julius von Verdy du Vernois, who is well qualified to speak with authority, since he took an active part in all the campaigns from 1863 to 1871, with the exception of 1864, and was one of the principal writers of the authoritative *Geschichte des Kriegs von 1866* and other government publications.

Among biographical works, Bismarck literature still holds a prominent place. The well-known *Gedanken und Erinnerungen* have been augmented by two supplementary volumes, containing in all upward of 1,000 pages, the first dealing with the

relations between the Emperor William I. and Bismarck, the second containing selections from the latter's correspondence. *Fürst Bismarck und der Bundesrat*, by Heinrich von Poschinger, has at last been completed by the appearance of the fifth volume, which covers the years 1881-1900. Still another work which deserves emphasis is *Fürst und Fürstin Bismarck*, by the veteran statesman, Robert von Keudell, who for many years was closely associated with the chancellor, both politically and socially, and who here adds to his title-page the explanatory sub-title, "Recollections of the years 1846 to 1872."

Biographies of a literary and critical interest include a serious study of Mme. de Staël, by Mathias Friedwagner. While recognizing her intellectual strength, this biographer holds that on the whole the author of *Corinne* has been too far exalted, and that to a large extent she shone in the reflected light of her predecessors, who have been unjustly forgotten. Richard Ackermann is the author of a brief but suggestive monograph upon Lord Byron, *Sein Leben, seine Werke, sein Einfluss auf die Deutsche Litteratur*. Benno Diederich, who has already proved his intelligent appreciation of the French realists in a brief but clever sketch of Zola, has recently published *Alfonse Daudet, sein Leben und seine Werke*, which is receiving cordial praise for its impartial treatment of the author of *Sapho*. A notable contribution to literary autobiography is *Jugenderinnerungen und Bekenntnisse*, by the veteran novelist, Paul Heyse. There is a pervading tone of melancholy in these memoirs, which clearly betray the author's chagrin that the public has failed to appreciate his efforts as a dramatist to the same degree that they have his works of fiction.

Fiction.—Among the older generation of novelists, none is better known than Friedrich Spielhagen and Marie von Ebner-Eschenbach, each of whom has published a volume of uncommon significance. *Freiebornen* is the title of Spielhagen's novel, a sombre, gloomy tale of an unhappy woman's life, from her school days to the loneliness of a convent, through irksome years as companion in a Jewish family, down to the disillusion of an unfortunate marriage, and her final fate as a confirmed invalid. Nevertheless, this "freeborn lady," in spite of her bitter experiences, ends by finding a philosophy of life, and works out for herself the freedom of soul for which she has so long striven. Marie von Ebner-Eschenbach's new volume is not a novel, but a collection of short stories, *Aus Spätherbsttagen*, all of which have this in common with Spielhagen's romance, that they deal primarily with the sorrows and sufferings of women. Typical of the volume is the brief but powerful sketch called "Maslan's Wife," depicting a much-wronged woman who has repeatedly pardoned her faithless husband up to the day when her patience is tried beyond endurance. And then she takes an oath never again to seek him out unless expressly summoned by him—an oath that she keeps even when he is on his death-bed. In similar vein is "To be Burned Unopened," which also deals with a husband who is openly unfaithful, regarding infidelity as a prerogative of his sex. But when, in the course of time, the wronged wife dies and he finds among her papers a packet of letters "to be burnt unopened," he obeys the instruction, but, judging her by his own standard, is seized by a doubt of her loyalty, and thus is led into killing his best friend before his eyes are opened to the truth. Another story which has attracted some attention is *Die Geschichte der jungen Renate Fuchs*, by Jacob Wassermann. The general tone of this book is strongly symbolic, and the central thesis is that a young woman may pass through a series of trying vicissitudes and improbable adventures, and yet preserve her original honesty and purity of thought. Two North German novelists, whose names have hitherto been identified with the realistic school, Wilhelm von Polenz and Georg von Omteda, both show a tendency in their latest volumes to devote themselves more and more to depicting the inner life of the soul. Omteda's new stories are *Monte Carlo* and *Cäcilie von Sarryn*, forming a continuation of his history of a "Deutscher Adel um 1900," begun last year by his much-praised *Eysen*. Von Polenz's new story, *Liebe ist ewig*, though full of psychological interest, is criticised for its vagueness. Another writer who has earned a fair degree of recognition is Clara Viebig, whose latest volumes are a collection of short sketches, called *Die Rosenkranzjungfer*, and a novel, *Das tägliche Brot*, depicting the fate of two servant girls who come to Berlin and there seek employment. Among the younger generation of writers who have lately sprung up in Vienna, Arthur Schnitzler is the one who has best proved his claim to be a leader. Since he first came into notice five or six years ago with a volume of powerful sketches called *Sterben*, his most decided successes have been won in the field of the drama, his latest achievement in that line being *Das Verächtniss*, in which the sudden death of a dissipated young army officer reveals to his family the existence of an illegitimate child, and forces upon them the problem of determining what shall be the status of that child's mother. Schnitzler's latest novel, *Frau Bertha Garlan*, is strongly psychological. It is a study of a young widow's gradual reawakening to the demands of the senses, her yielding to temptation, and her subsequent remorse. Other novels of the year which deserve at last a cursory mention are: *Ma*, by Lou

Andreas-Salome, dealing with the tragedy of a mother's renunciation; *Eine Schuld*, by Wilhelm Jensen, the chief charm of which, as in his earlier novels, lies in the beauty of his descriptions of nature and scenery; *Die Overbecks Mädchen*, by Max Grad, a study of twin sisters, who have respectively the qualities of a Martha and a Mary; and lastly, a volume of characteristic sketches by Paul Heyse, entitled *Ninon und Andere*.

GERMAN REFORMED CHURCH. See REFORMED CHURCH IN THE UNITED STATES.

GERMAN SOUTHWEST AFRICA, a German protectorate with an Atlantic coast line of 930 miles, interrupted, however, about in the middle by Walfisch Bay, a British possession comprising about 430 square miles. German Southwest Africa is bounded on the north by Angola and on the east and south by British possessions. The estimated area is 322,450 square miles, and the population is estimated at about 200,000. On January 1, 1900, there were 3,388 white persons in the colony, of whom 2,146 were men. Of these men 1,658 were Germans, 128 were English, and 801, of whom 799 were Germans, were connected with the army; there were 150 merchants (139 German), 41 clergymen and missionaries, 422 planters, and 674 laborers. The colony is administered by an imperial commissioner stationed at Windhoek, 180 miles inland from Walfisch Bay. There is a local police force in the principal towns. The coast lands and the southern part of the protectorate are barren, and although large areas of the interior are fit for cultivation, the region is by no means productive. The budget for 1900 balanced at 10,727,000 marks, of which 9,378,000 marks were contributed by Germany. (The mark is worth 23.8 cents.) The exports in 1899 were 1,399,478 marks, of which the main items were guano, valued at 1,095,000 marks, and live-stock, valued at 120,200 marks. Ostrich feathers also form an important part of the exports. The imports in 1899 were valued at 8,941,154 marks, consisting of canned goods, iron, building materials, textiles, tobacco, liquors, beer, and coffee. Of these commodities, by far the greater part came from Germany. Communication with the coast is difficult, and therefore the chief route of trade from the interior is over the mountains to Cape Town.

The government is doing its utmost to develop this territory. It has given concessions to the German Colonial Company for Southwest Africa; and in Damara-land the Southwest African Company has a mining concession. There are eleven companies formed to induce colonists to settle, for the development of mineral resources or other industries. It is reported that both gold and copper exist in paying quantities, but the facilities of transportation from the mines to the coast are so meagre that little attempt has been made at exploitation. In the neighborhood of Bersaba, the German Mining Syndicate has found diamonds, and a great marble quarry has been discovered between Otjimbingue and Ubib. This stone is said to be as fine as that of Carrara. The rinderpest, which has depleted the herds of cattle ever since 1897, is apparently yielding to treatment with Koch's lymph. Sheep, Angora goats, camels, and swine are raised with some success. The government has improved the roads from the coast to the interior, and over the pass of the Auas Mountains, which had been impracticable for freight wagons, a road six metres wide has been built. The roads along the coast have been improved, and a great highway from Luderitzbucht to Keetmanshoof is being laid out. The railway, the route of which has been surveyed from Swakopmund through several important towns to the capital city, Windhoek, was on July 1, 1901, in operation as far as Karibib, 112 miles from the coast terminal. At this terminal, the harbor has been improved and is said to be almost as commodious as that of Walfisch Bay. Swakopmund is connected by cable with Cape Town, and a telegraph line follows the railway inland. There are post-offices at Windhoek, Keetmanshoof, Otjimbingue, and Swakopmund, together with 24 subordinate postal agencies.

GERMANY, a European empire consisting of twenty-five states and the imperial provinces of Alsace and Lorraine. The capital is Berlin.

Area and Population.—The total area of Germany is 208,830 square miles, and the population, according to the census of December 1, 1900, 56,345,014. The table on the next page shows the states comprising the empire, their area, their population on December 1, 1890, on December 2, 1895, and on December 1, 1900, and the percentage of increase between the last two dates.

According to the last census there were 27,731,067 males and 28,613,947 females. The density of population in 1895 was 250.5 to the square mile, and in 1900, 269.3. The population of the territory now included in the empire (without Heligoland) was 24,831,396 in 1816, 31,589,547 in 1837, 41,058,792 in 1871, and 45,234,061 in 1880. In 1900 the populations of cities with over 200,000 inhabitants were as follows: Berlin, 1,884,151; Hamburg, 705,738; Munich, 499,959; Leipzig, 455,089; Breslau, 422,738; Dresden, 395,349; Cologne, 372,229; Frankfort-on-Main, 288,489; Nurem-

burg, 261,022; Hanover, 235,666; Magdeburg, 229,663; Düsseldorf, 213,767; Stettin, 210,680; Chemnitz, 206,584. In 1901 there was a very noticeable increase in the number of emigrants from Germany. There was an increased emigration to Argentina and Uruguay but a decline in that to Brazil.

Government.—The chief executive authority rests with the emperor, William II., of the House of Hohenzollern, who is also king of Prussia; he was enthroned in 1888. The heir apparent is Prince Frederick William, who was born in 1882. The first minister of the empire is the imperial chancellor, who has charge of the department of foreign affairs; he is appointed by the emperor and, unlike the other ministers, is responsible to the imperial legislature. This is a bicameral body consisting of an upper house, or *Bundesrath*, the members (58) of which represent the individual German states, and a lower house, or *Reichstag*, whose members (397) represent, and are elected by, the people. The emperor convokes these bodies annually and has no veto on the laws enacted by them. The imperial chancellor (and president of the Prussian ministry) since October, 1900, has been Count Bernard von Bülow.

Army and Navy.—All Germans capable of bearing arms are liable to service in the army or navy for at least six years. Pursuant to the law of 1899 the peace strength of the imperial army in 1903 will be 495,000. The army on a peace footing in 1900 numbered 23,850 officers and 576,666 men. The infantry comprised 13,314 officers and 386,865 men, and the cavalry, exclusive of about 800 in special service, 2,406 officers and 66,229 men. The estimated strength of the German army on a war footing is over 3,000,000 trained men.

A law dated June 14, 1900, provides that by 1916 the navy, exclusive of torpedo boats, special service vessels, gunboats, and training ships, shall comprise 34 battleships, 11 large and 34 small cruisers and, as a reserve, 4 battleships and 3 large and 4 small cruisers. It seems not unlikely that the new navy will be completed before 1916. All of the new battleships excepting one will be laid down by 1905 and all the new cruisers by 1909; after the latter date, accordingly, the construction will be merely to replace older vessels. Exclusive of transports and old and non-effective vessels, the navy in February, 1901, consisted of 1 first-class battleship (and 6 building), 10 second-class battleships, 1 armored cruiser, 8 third-class battleships (and 1 building), 19 coast defense vessels, 15 protected cruisers, 8 torpedo gunboats, 11 destroyers (and 8 building), 35 first-class torpedo boats, and 103 second and third class torpedo boats. There were laid down in 1901 2 battleships of 13,000 tons; 1 armored cruiser of 8,870 tons, to replace the *König Wilhelm*; 3 small cruisers of 2,800

tons, and 6 destroyers of 350 tons. The new battleships will have 15,000 indicated horse-power and a speed of about 19.5 knots. The naval complement for 1900-01 consisted of 1,305 officers, 24,727 petty officers and seamen, and about 2,300 others. The enthusiasm that for a number of years has led the emperor and his ministers to strive for the construction of a navy commensurate in strength with the German army has, it appears, taken possession of the German people; excepting, of course, the Socialists and Agrarians. The naval budget for the fiscal year 1901 was 196,734,172 marks (\$46,822,733), of which 74,983,000 marks (\$17,845,954) were devoted to ship-building and 25,003,000 marks (\$6,093,514) to armament. This budget provided for the construction of new vessels, the conversion of the coast-defense vessels of the old *Siegfried* type into sea-going warships, the building of arsenals, the increasing of armament, and the laying of submarine cables. The supplementary budget for the Chinese expedition of 1900-01 contained appropriations for the establishment of a naval base at Kiao-Chau. The reported estimates adopted by the federal council for 1902 amounted to 209,000,000 marks (\$49,742,000), a decrease of 3,400,000 marks (\$809,200) from the amount named in the Navy Bill for 1902.

Finance.—The monetary standard is gold and the unit of value is the mark, worth 23.8 cents in United States money. The imperial revenue is derived mainly from customs duties, excise, posts, telegraphs, stamps, and state railways. Deficits are made up by assessments on the several states, levied in proportion to population. The largest imperial expenditures are for the departments of war and finance; according to the budget for the year ending March 31, 1901, the expenditure for the former amounted to 541,758,000 marks and for the latter 520,295,000 marks. The total revenue and expenditure, according to the budget estimates, have been as follows for fiscal years ending March 31: 1900, revenue, 1,921,062,000 marks and expenditure, 1,946,583,000 marks; 1901, revenue, 2,025,770,000 marks, and expenditure, 2,056,497,000 marks; 1902, the revenue and expenditure balance at 2,354,121,046 marks. For the last year the largest items of estimated revenue were, in marks: Customs and excise, 810,330,850; federal contributions, 570,933,000; posts and telegraphs, 420,162,950; stamps, 114,020,000; railways, 93,676,000. Similar figures for estimated expenditure were: Imperial army, 673,124,600; imperial treasury, 578,296,260; posts and telegraphs, 382,394,633; navy, 207,484,172; imperial debt, 88,967,500; pension fund, 70,994,638. The reported amount of the total funded debt at the end of March, 1899, was 2,222,950,700 marks; the unfunded debt, represented by imperial treasury bills, on the same date amounted to 120,000,000 marks. In September, 1900, a new loan was issued for 80,000,000 marks, and in March, 1901, the government arranged for still another loan of 300,000,000 marks.

Industries.—Formerly Germany was a distinctively agricultural country; cultivation, both extensive and intensive, almost reached its limit. A reaction set in and large numbers of the working classes left the farms for the factories. This movement is clearly seen in the returns of the last census, which show a remarkable increase in the urban population. The farm lands now actually suffer from a lack of laborers, and as a result the Agrarian party has increased its efforts toward the enactment of higher tariffs on agricultural products. On the other hand the rapid development of German manufactures received a check in 1901, when the economic situation, both agricultural and industrial, was inauspicious.

The following figures are the official returns in metric tons (2,204.6 pounds) for some of the principal German crops in 1899 and 1900:

Crop.	1899.	1900.	Crop.	1899.	1900.
Potatoes	38,486,202	40,585,317	Oats	6,882,687	7,091,930
Hay	23,767,790	23,116,276	Wheat	3,847,447	3,841,165
Rye	8,675,792	8,550,659	Barley	2,983,876	3,002,182
Clover	8,277,273	6,781,284	Alfalfa	1,351,104	1,316,441

The average yield a hectare (2.471 acres) in 1900 of wheat, barley, oats, potatoes, and hay slightly exceeded the mean annual average for the preceding eight years, while the average of clover and alfalfa was considerably below the mean average. Estimates in tons for 1901 were: Rye, 8,145,500; oats, 7,105,000; wheat, 2,470,000; barley, 3,021,860. The estimated import of wheat in the latter year was 3,000,000 tons and of rye 1,000,000 tons. The falling off in the wheat and rye crops in 1901 led to serious discussions concerning the food supply of the empire, and in order to avoid threatened disaster, a memorial was addressed to Count von Bülow, minister-president of Prussia, asking that the government adopt certain measures of relief. Among these proposed measures were loans at a low rate of interest to farmers, a reduction of freight rates on agricultural produce, and the postponement of the payment of agricultural rents. These conditions led the Agrarians to demand higher tariffs on agricultural products, while to all others the same conditions obviously suggested lower tariffs. The live-stock in Germany on December 1, 1900,

numbered 4,180,000 horses, 19,011,631 cattle, 16,693,135 swine, 9,682,262 sheep, 3,207,688 goats.

It was generally recognized in 1901 that a crisis in the beet sugar industry was impending in central Europe. The sugar production of Germany, Austria-Hungary, France, and Russia has continued to increase and in Germany far exceeds the local consumption. In that country the short grain crops of 1901 indicated a reduction in the purchasing capacity of the poorer classes, so that it was thought the consumption of sugar would decline by 75,000 tons in the fiscal year 1902. The prospects of the German sugar industry are rendered still worse by the threatening competition of Cuban sugar in the United States, as well as by the rapid increase of the beet sugar industry in that country.

The following figures compare in estimated amount and value the principal minerals raised in 1898 and 1899:

	1898.		1899.	
	Metric tons.	Marks.	Metric tons.	Marks.
Coal	96,309,652	710,233,000	101,639,753	789,449,000
Lignite	31,648,898	73,380,000	34,204,666	78,450,000
Iron ore	10,552,312	49,678,000	11,975,241	57,180,000
Zinc ore	641,706	22,047,000	664,536	35,420,000
Kainite and other potassium minerals	2,208,855	29,651,000	2,493,131	32,161,000
Copper ore	702,781	19,685,000	733,619	20,868,000
Lead ore	149,311	13,113,000	144,370	14,112,000
Rock salt	807,792	3,389,000	861,123	3,828,000

The total reported value of foundry products in 1898 was about 541,500,000 marks and in 1899 about 656,500,000 marks. In the latter year the values in marks of the most important foundry products were as follows: Pig iron, 411,300,000; zinc, 73,000,000; copper, 50,100,000; silver, 37,800,000; lead, 37,300,000; sulphuric acid, 22,000,000; gold, 7,300,000; nickel, 6,200,000. Besides metal manufactures the important industrial products include textiles, beer, and sugar.

The industrial situation in Germany during 1901 was not satisfactory. By the middle of the year there was a serious depression in many of the most important industries, including machinery and the metal industries in general, coal, textiles, chemicals, cement, glassware, and furniture. The cause of this depression was believed to be overproduction in Germany and other manufacturing countries. The manufacturers hoped that some relief would be afforded by the commercial treaties then under discussion. In general the long-time commercial treaties were favored; largely to treaties, it is stated, is due the increase of German commerce by about \$1,000,000,000 in the last decade. It was reported in November that the industrial and commercial depression was assuming a very serious aspect, especially since the number of unemployed was increasing daily, while the condition of imperial and Prussian finances was beginning to appear unfavorable. At the end of the year the number of unemployed in Berlin was estimated as high as 80,000.

During 1901 the effect of American importations upon European industries, especially those of Germany and Austria-Hungary, was widely discussed, and various proposals were made for a general European customs union against American products. In writing upon this question, Dr. Alexander von Peez said in the *Allgemeine Zeitung*: "Not China and not the Transvaal War, but the race between the great industrial countries—England, Germany, and the United States—forms to coolly calculating politicians the foremost, weightiest, and most enduring interest of the future. England's commercial growth has been slow. Germany has risen more rapidly after gaining political unity and establishing the protective system, but like a storm is the forward movement of the United States." Dr. von Peez reviewed the various tariff systems and commercial treaties of the European countries, and suggested that the relations of the European nations to the United States should be carefully studied with a view to the establishment of reciprocity treaties. In these, he believes, lies the greatest safety of European industries. Under present conditions—that is, since 1890—American foreign products have well-nigh shattered the agricultural industries of Germany; while already the German production of coal, iron, steel, and machinery is threatened by the American products. In the three years preceding 1901, the cash balance against Europe in favor of the United States was \$1,600,000,000.

Commerce.—The customs territory (*Zollebiet*) embraces practically all of Germany. The special trade of this territory has been reported in marks as follows:

Years.	Imports.	Exports.	Years.	Imports.	Exports.
1897	4,864,644,000	3,786,241,000	1899	5,783,628,000	4,368,409,000
1898	5,439,676,000	4,010,565,000	1900	6,042,992,000	4,752,601,000

Included in these figures are specie and bullion, the imports of which in 1900 amounted to 277,000,000 marks and the exports 141,000,000 marks. The trade in 1900 exceeded that of any previous year; compared with the commerce of 1884, when the present commercial treaties went into effect, the imports show an increase of 41 per cent. and the exports an increase of 56 per cent.

The trade with countries of greatest commercial importance for 1899 and 1900 is stated in marks as follows:

Countries	1899.		1900.	
	Imports from	Exports to	Imports from	Exports to
United States	907,200,000	377,600,000	1,020,764,000	439,653,000
Great Britain	777,769,000	852,972,000	840,661,000	912,219,000
Austria-Hungary	730,364,000	466,010,000	724,332,000	510,730,000
Russia	701,700,000	396,600,000	716,535,000	324,889,000
France	303,100,000	216,700,000	305,500,000	277,600,000
Argentina	194,500,000	234,600,000
Belgium	240,085,000	207,073,000	220,500,000	253,100,000
Netherlands	203,291,000	327,711,000	215,400,000	359,900,000
British India	230,480,000	65,255,000	204,900,000
Switzerland	176,307,000	284,666,000	292,100,000

The total trade of Germany with the first four countries given in the foregoing table exceeded her trade with all the rest of the world, but the value of her exports to these countries was less than half of the total exports. It should be noted that the exports to Russia in 1900 fell considerably short of those for the preceding year and were exceeded in value by those sent to the Netherlands. Germany's trade with Mexico and the South American countries (except Chile) and with the Philippine Islands substantially increased in 1900.

The leading imports, with their values in marks, in 1899 and 1900 respectively include the following: Cotton and cotton goods, 331,700,000 and 419,900,000; wool and woollen goods, 559,600,000 and 410,800,000; silk, 177,900,000 and 200,600,000; coffee, 128,000,000 and 131,900,000; iron and iron wares, 100,600,000 and 121,300,000. The total agricultural imports in 1899 and 1900 amounted to 857,300,000 marks and 853,400,000 marks respectively. In the latter year the wheat import was valued in marks at 172,800,000; corn, 128,800,000; rye, 100,000,000; barley, 92,800,000; oats, 48,400,000. The coal export in the same year amounted to 114,600,000 marks. The value of the machinery export rose from 81,500,000 marks in 1899 to 92,400,000 marks in 1900. Among the principal exports in 1899 and 1900 respectively were: Iron and iron wares, 409,800,000 marks and 473,400,000 marks; wool and woollen goods, 359,300,000 and 354,900,000; cotton and cotton goods, 263,400,000 and 309,900,000; sugar, 204,100,000 and 227,600,000; agricultural produce, 122,300,000 and 137,700,000. The exports of machinery in the two years were valued at 250,500,000 marks and 281,700,000 marks respectively, and of rails, 13,200,000 marks and 18,700,000 marks respectively. The coal export in 1900 was valued at 209,300,000 marks. Trade statistics for the first half of 1901 show a falling off in German commerce, as compared with the same months of the preceding year. The value of the imports was 2,884,500,000 marks, or 106,700,000 marks less than during the first six months of 1900; and that of the exports was 2,253,200,000 marks, which shows a decrease of 73,000,000 marks.

The sale of American cereals has increased of late over that of Russian in the German markets. For 1897, Russian barley, oats, maize, rye, and wheat imported into Germany, amounted to 2,336,688 tons, valued at \$58,636,616; while the importation of the same cereals from the United States amounted to 1,541,229 tons, valued at \$31,334,206. In 1900, however, the Russian cereals had decreased to 1,943,063 tons, valued at \$47,944,340; while the American had advanced to 1,725,959 tons, valued at \$42,997,090. It must be pointed out, however, that in the near future American cereals will have greater difficulty in competing with the Russian products in the markets of Germany; for the construction of new railways and canals in Russia will make easier and cheaper the transportation of her crops toward the German border. It is not unlikely, moreover, that American grain will encounter sharp competition in Germany with that of Austria-Hungary; for the projected railways and canals in that monarchy will have the same effect on the transportation of grain crops as the railways and canals of Russia will have.

Communications.—On April 15, 1900, the total length of the German railways was 50,961 kilometres, of which 45,969 kilometres belonged to the imperial or state governments and 4,992 kilometres to private companies. On April 15, 1901, the total length was 51,850 kilometres, of which 46,784 kilometres were public and 5,066 private lines. On the latter date the length in kilometres of the railways owned by the government in the most important states was as follows: Prussia and Hesse, 30,918; Bavaria, 5,883; Saxony, 3,036; Württemberg, 1,843; Alsace-Lorraine, 1,661; Baden,

1,552; Mecklenburg, 1,106. The capital stock of the standard-gauge lines, 49,331 kilometres on April 15, 1900, and 50,046 kilometres on April 15, 1901, amounted on the former date to 12,134,000,000 marks; the working receipts for the year then ending were 1,840,000,000 marks and the working expenses 1,117,000,000 marks. A notable electric tramway was projected in 1901. This line, which is to be constructed at an estimated cost of \$33,000,000, will connect Berlin with Hamburg, 156 miles distant, and the trains are expected to have a speed of 125 miles an hour.

At the beginning of 1899 the waterways navigable for vessels of a 3-foot 3-inch draught aggregated 7,652 miles. This mileage was divided as follows: Navigable rivers, 4,913; canalized rivers, 1,317; canals, 1,422.

In 1899 there were reported 77,910 miles of telegraph lines, 23,729 telegraph offices, and 36,464 post offices. In that year the receipts from posts, telegraphs, and telephones amounted to 423,440,638 marks and the expenditures 374,888,392 marks.

Religion and Education.—The principle of religious liberty prevails, though most of the religious orders, particularly the order of the Jesuits, have been suppressed. In 1895 the reported number of Protestants was 32,827,841; Catholics, 18,578,285; other Christians, 167,183; Jews, 561,323. Primary education is compulsory throughout Germany. For secondary and higher education there are numerous high schools, gymnasia, etc., and technical schools and universities. The presence of large numbers of foreigners in the universities is causing some dissatisfaction in Germany. In the summer of 1901 it was reported that these foreigners numbered 2,606, of whom 855 were at Berlin, 370 at Leipzig, 232 at Munich, 159 at Heidelberg, 141 at Halle, 140 at Freiburg, 102 at Göttingen. The principal nationalities were represented as follows: 717 Russians, 507 Austrians, 323 Americans (mostly from the United States), 256 Swiss, 157 Englishmen, 154 Asiatics (mostly from Japan), 68 Bulgarians, 50 Dutchmen, 47 Frenchmen, 35 Turks. At the universities 7.3 per cent. of the student enrollment is foreign. The foregoing figures do not include the numerous foreigners at the technical high schools. In some quarters "it is felt to be unjust that so many strangers should reap the benefit of the sacrifices made by the German states for the higher education of their youth." An appropriation bill adopted in the spring of 1901 authorized subventions for 125 German schools in foreign countries. Of prime importance among these is a school at Constantinople, one each at Galatz, Antwerp, Brussels, Pretoria, Johannesburg, three schools at Buenos Ayres, and four at Bucharest.

HISTORY.

The Reichstag.—The *Reichstag* convened on November 14, 1900, and adjourned on May 15, 1901. The proposed appropriations for the Chinese expedition of 1900, which was carried on under imperial authority and without legislative sanction, called forth considerable criticism of the emperor from the Radicals and Socialists. The appropriations, however, were finally sanctioned on February 15, 1901. The measure known as the Clerical Toleration Bill, which was introduced in the *Reichstag* on December 10, 1900, failed of enactment. The Federal Council held that the plan removing religious limitations imposed by the individual states would violate the constitutional autonomy of such states. The Army Pensions Bill, introduced in the *Reichstag* on April 16, 1901, made certain provisions for men, military and naval invalided in wars carried on by Germany since the establishment of the empire or by the German states before 1871, and for the families of soldiers or sailors killed in such wars. The measure became law on May 31. In May, also, a bill was passed consolidating and amplifying the laws of copyright dealing with literary and musical works. Other measures enacted also in May were as follows: A law regulating the purity of spirituous liquors; providing accident insurance for soldiers and civil officials and strengthening state control over insurance companies; and giving to the decisions of industrial courts a more compulsory character. In the same month the *Reichstag* passed a bill authorizing the government to continue to its "most favored nation" treatment to imports from Great Britain and her colonies (excepting Canada) until December 31, 1903. At that time the commercial treaties with Austria-Hungary, Russia, Italy, and other European states will expire. The *Reichstag*, which adjourned on May 15, reconvened on November 26, 1901.

The Proposed Tariff.—The proposed revision of the German tariff laws, and in connection therewith the renewal of the commercial treaties mentioned above, and the question of Prussian canals, treated in a succeeding paragraph, were the two questions that called forth the greatest amount of discussion, parliamentary and popular, in 1901. For some two years the government had had under discussion a revision of the tariff and the proposed bill, as finally completed, was published on July 26. It evidently was designed primarily to attract the Agrarian vote, which is necessary to carry into effect the emperor's plans for canals. The new bill provided for a general tariff increase and in particular for an increase in customs on agricultural products; and it established minimum rates on cereals, below which

commercial treaties might not be concluded by the government. Provisions, however, were made for reciprocity treaties, and also for retaliatory duties against countries not according "most favored nation" privileges to Germany. The government intended the bill, if enacted, to go into effect upon the expiration of the existing treaties of commerce—that is, on January 1, 1904.

So comprehensive were the concessions of the bill to the Agrarians, showing a general advance of from 50 per cent. to 300 per cent. on food stuffs, that a storm of protest was immediately called forth from the entire liberal, industrial, and commercial press. The most important advances over the old tariff schedule were in cereals, meats, and live animals. The advance on wheat will affect most directly the United States, Argentina, Russia, and the Balkan states, while that on rye will chiefly affect Russia. The public discussion of the bill was directed principally to what German manufacturers regarded as its inadequacy in protecting their industries, and to the large advances in the duties on food products, which advances would be most keenly felt by the non-agricultural classes. So serious seemed the prospect of the increased values in food materials that the Berlin *Tageblatt* said the new tariff would "revolutionize the whole economic, industrial, and commercial status of the German people, drive a large proportion of the laboring classes back to a diet of black bread and potatoes, diminish the productive strength of the nation, and its consequent power of competition, and by provoking reprisals from agricultural nations, like Argentina, Austria, and Russia—to say nothing of the United States—imperil the foreign markets for German manufactures, which have been to so large an extent the mainstay of the empire's export trade."

The uncompromising attitude of the Agrarians in their struggle for high tariffs on agricultural products has doubtless in many instances been caused by actual need. The landlords have suffered severely by falling prices and a rising rate of farm wages. Upon the impetus toward industrialism and the general movement of population to the cities many of the landlords mortgaged their estates and bought shares in the new industrial companies. Manufacturing interests were encouraged by the emperor, who, in the expectation of large returns from this new development of German enterprise, proposed the construction of great canals and large expenditures on the navy "to protect our growing commerce." When the inevitable overproduction and reaction came—in 1900-01—the landlords, as well as those directly engaged in industrial enterprises, suffered severely. But since German agriculture is on the decline and the real hope of German prosperity seems to lie in manufacturing industries, the position taken by the government for a tariff distinctively favoring agricultural produce to the detriment, indirectly at least, of manufactures, is, according to the *New York Journal of Commerce*, "remarkable as anything ever presented in the history of national economy." It was pointed out that as soon as England realized that progress depended on her manufactures she took the taxes off food-stuffs, and that the United States, already having cheap food, had fostered industries by the protective tariff; but "Germany is undertaking to make food dear when the great national development has been in the line of manufacturing; when all the gain in population for twenty or thirty years has been in the towns; when great efforts are being made to get foreign business for the manufacturers; . . . when the industries of the country are prostrated; when wages have been reduced and great numbers of persons have been thrown out of employment, and manufacturing corporations that paid 30 per cent. dividends last year are passing their dividends this year. It would have been impossible to take action, which in its character and its inopportune-ness would be a greater blow to the industrial, and in general the urban, population of Germany."

The London *Speaker* declared that the proposed tariff would not only "force Russia and the United States to retaliatory measures, but would shake to its very foundations the Triple Alliance;" it would drive Austria, as well as Russia and the United States, to seek new markets. On the announcement of the bill the Austro-Hungarian minister in Berlin advised the German government that its enactment would doubtless have a prejudicial effect on the Triple Alliance, while later both M. Szell, the Hungarian premier, and Count Goluchowski, the Austro-Hungarian foreign minister, declared that no treaty of commerce could be concluded with Germany on the basis of the proposed bill. M. Szell added that by adopting the tariff Germany "would raise the whole world in opposition to her." The semi-official Vienna *Fremdenblatt* went so far as to say, "If Germany wishes a tariff war, Austria, Russia, and the United States will be ready to accommodate her."

In introducing the tariff bill in the *Reichstag* on December 2, 1901, Count von Bülow, the imperial chancellor, attempted with little success to reconcile the opposing agricultural and industrial interests. "Possibly," said the London *Spectator*, "if he could have arranged so that each party could be present during one-half of his speech and absent during the other, he might have achieved some success." The chancellor said that Germany was exclusively neither an industrial nor an

agrarian state, but both at once, and that while the purpose of the tariff was to "meet the wishes expressed by the agricultural interest in favor of increased protection," the bill furnished the basis on which a good system of protection and a "fair compromise" might be founded. This "fair compromise," however, was not obvious. The chancellor seemed unconscious of the distress existing in many branches of German industry, and the argument that high prices for farm products mean an increase in the cost of living seemed to have little weight with him. It seemed, indeed, that his position was due not so much to a desire for the amelioration of economic conditions as to his wish to secure parliamentary approval of the ministry. Even this, however, did not seem absolutely certain, since some of the Agrarian extremists announced that though the proposed tariffs on foreign products were high they would not vote for the bill unless these tariffs were made practically prohibitive. When the *Reichstag* adjourned for the Christmas recess, the debate on the first reading of the tariff bill had been concluded and the bill referred to a committee. At the close of 1901 opposition, both in the *Reichstag* and among the people, had become so keen that the bill seemed to have small chance of enactment in its existing form.

The Meat Inspection Law.—The meat inspection law, which was enacted in May, 1900, does not seem to be popular. Although the government insisted that the bill was essentially a sanitary measure, and although in its final form it was not generally approved by the Agrarians, still in 1901 it was regarded in some quarters as "a cloak, faded and worn, hung over the Agrarian idol." Since the law went into effect the prices of meat have risen materially, and as foreign canned meats, corned beef, sausages, etc., are entirely excluded, fresh meats considerably more expensive are forced on the market. Such a condition is burdensome to the industrial population.

Strikes.—During 1900 there were begun in Germany 1,492 strikes and 1,433 strikes were brought to an end. These strikes affected 7,740 different business concerns and 298,819 persons, while the greatest number of persons on strike at one time was 122,803. In proportion the number of lockouts was exceedingly small.

Early in 1901 the German supreme court handed down a decision, which though involving an insignificant amount of money was of great importance in establishing a principle touching strikes. The case arose from the refusal of twenty molders employed in an iron foundry to finish some models sent from a foundry where a strike was on. They were finally discharged without the usual notice and were sued for damages by the employer. Judgment was rendered in favor of the plaintiff, holding the defendants jointly and separately for the entire damage, and the superior court, to which appeal was taken, affirmed the verdict. The court held that the law does not expect an employer to yield to the unlawful refusal of his employees to do certain work, although the latter may be willing to do other work; while the immediate discharge of the defendants did not exclude the claim for damages, since the premature dissolution of the labor relation was caused through the defendants' own fault, for the detrimental consequences of which they were responsible.

Colonies.—During the debates in the *Reichstag* on the colonial estimates in March, 1901, Dr. Stuebel, the director of the colonial department of the foreign office, admitted that the commercial development of the German colonies had been disappointing—a fact he attributed to difficulties of internal communication. He denied the accusations of Herr Bebel that recent revolts in German colonies were due to the hut tax, and stated that efforts were being made to ameliorate as far as possible the abuses accompanying domestic slavery in German East Africa. In the last few years the colonial budget has greatly increased, while so insignificant are the German customs receipts on products imported from German colonies that it is thought both the mother country and the dependencies would benefit by the abolition of such duties.

German Anglophobia.—During 1901 the spirit of the German people, if correctly reflected by the German press, was distinctively anti-British. The Anglo-German agreement of October 16, 1900, concerning China was coldly received by the people, and the unusually friendly attitude of Emperor William on his visit to England at the time of Queen Victoria's funeral called forth little applause, while soon after the conferring by the king of the Prussian Order of the Black Eagle upon Earl Roberts was widely disapproved. Great Britain's war against the Boers was extremely unpopular in Germany, although the government maintained strict neutrality. In November, 1901, popular feeling against the British became intense through a speech on the war, in part misunderstood, made in Edinburgh by Mr. Chamberlain, the British colonial secretary. At the close of the year the German press was very bitter against Great Britain.

Prussia. The Bicentenary.—The two-hundredth anniversary of the founding of the Prussian monarchy, that is, the coronation of Frederick I., was celebrated throughout the kingdom on January 17 and 18, 1901. King William issued a decree, signed by all the Prussian ministers, founding a new order to be called the Order of Merit of the Prussian Crown, and to rank immediately after the Order of

the Black Eagle. The king also distributed 3,772 decorations and honors and appointed fifteen new peers to the *Herrenhaus*.

A New Prussian Canal Bill.—It will be remembered that in August, 1899, the lower chamber of the Prussian *Landtag* rejected the canal bill introduced by the government, providing for the construction of waterways, navigable for vessels of considerable tonnage, between the Rhine and the Elbe, by way of Dortmund and Minden, and for the canalization of the Weser from Bremen to Minden. At that time a canal had just been opened from Dortmund to the Ems. The stoppage of further progress to the canal plan, which for some time has been one of the king's favorite measures, was due in large part to the Agrarian and Conservative influence that is suspicious of Germany's new industrial progress and her increasing foreign commerce, since these developments, it holds, are inimical to German agriculture. Especial opposition was brought against the bill by the poorer agricultural provinces east of the Elbe; these provinces urged that while the entire kingdom would bear the canal expenditure, only the western half would in any way benefit thereby, and that they, moreover, would particularly suffer from the more active competition of foreign agricultural produce in the Berlin and other important markets. Consequently the new canal bill, which was communicated by the government to the *Landtag* on January 12, 1901, endeavored to remove the favoritism of the west at the expense of the east. The bill provided for the extension of the canal system practically to all parts of Prussia, and accordingly involved a much greater expenditure than that contemplated by the defeated measure of 1899. The total outlay proposed amounted to 389,010,700 marks. This sum was designed to cover the cost of construction of the following waterways: A Rhine-Elbe canal (260,784,700 marks); a ship canal between Berlin and Stettin on the Oder (41,500,000 marks); a canal connecting the Oder and the Vistula, and a channel rendering navigable for ships the Warthe from its confluence with the Netze to Posen (the two works to cost 22,631,000 marks); participation in the improvements in the Lower Oder and Upper Havel (40,989,000 marks and 9,670,000 marks respectively); the canalization of the Spree (9,336,000 marks); a canal effecting communication between the province of Silesia and the waterway now connecting the Oder and the Spree. The opposition to the bill became so strong that in April the Agrarians indulged persistently in obstructive tactics, and by the end of the month the government clearly realized that the measure could not be put through. Accordingly it was disinclined to continue a useless discussion, and on May 3, 1901, Count von Bülow, the minister-president, prorogued the *Landtag*. The ministers of finance, agriculture, and commerce, Dr. Johannes von Miquel, Baron von Hammerstein-Loxton, and Herr Brefeld, respectively, who were suspected of being hostile to the bill, were called upon to resign. They were succeeded by Baron von Rheinbaben (who was transferred from the ministry of the interior) as minister of finance, General von Podbielski, as minister of agriculture, and Herr Möller, as minister of commerce. Baron von Hammerstein, who held an administrative position in Lorraine, became minister of the interior. Aside from the royal determination to retain a ministry favorable to the canal scheme, for the enactment of which the king is still persistent, the change in ministry had little political significance.

The Department Store Law.—The law enacted by the Prussian *Landtag* in July, 1900, and taking effect on January 1, 1901, which authorized special taxes on department stores, did not seem during 1901 to correct the abuses against which it was aimed. The fact that during the second half of 1900 there was a dull market for German manufactures enabled the department store managers to contract for supplies at prices that practically nullified the effect of the new taxation. But more serious than this temporary condition is the unforeseen application of the law to various merchants, for whose protection it was especially enacted. Indeed, a number of these middlemen have been compelled to give up their business, either wholly or in part, or to pay the tax, while increasing power and success have attended the department stores.

The Polish Question.—During 1901 a considerable amount of discontent developed among the Poles of eastern Prussia, which was formerly a part of the Polish kingdom. For a number of years the Poles have striven against "Germanization," and of late, not only in German Poland, but in Russian and Austrian, their aspiration for racial entity has become more and more apparent. The Germans have attempted unsuccessfully to wrest from the Poles economic supremacy in eastern Prussia; at present the most important landholders are largely Polish, and attempts have been made to boycott German commerce. German is the official language, and is used in the schools, but up to 1901 religious instruction was given in Polish. Upon the extension of the German language to religious education the Poles showed intense disapproval, and in the fall of 1901 certain Polish children at Wreschen, in Posen, acting on the advice of their parents or the priests, refused to receive such instruction. The children were publicly flogged and disturbances in which the parents took

part ensued; as a result a number of Poles were imprisoned for terms extending from a few weeks up to two years. The affair created much excitement not only in Posen, but in Russian Poland and Galicia; in Warsaw, Lemberg, and Cracow violent anti-German demonstrations took place. So strong was the anti-German feeling in eastern Prussia at the close of the year that it seemed likely the authorities would adopt a more conciliatory attitude.

GETTY, General GEORGE WASHINGTON, brevet major-general, U. S. A. (retired), died at Forest Glen, Md., October 3, 1901. He was born at Georgetown, D. C., October 2, 1819, and graduated at West Point in 1840, entering the army in the artillery service. After serving through the Canadian border war, the Seminole Indian War, and the Mexican War, and attaining the rank of captain, he entered the Union army in the Civil War with the Army of the Potomac. He fought in the engagements at Yorktown, Gaines' Mill, Malvern Hill, South Mountain, and Antietam, and in the course of the war was brevetted lieutenant-colonel, colonel, brigadier-general, and major-general in the regular army. In 1866 he became colonel of the 37th infantry, was transferred to the 3d artillery in 1871, was in command of the troops along the Baltimore and Ohio Railroad in 1877, and in 1888 retired from active service.

GIBB, ELIAS JOHN WILKINSON, British Orientalist, died in London, December 4, 1901. He was born in Glasgow in 1857, and was educated at the university in that city. Upon his graduation he took up the study of the Turkish language and literature, and in 1879 brought out his first translation, *The Capture of Constantinople*, from the Turkish of Sa'd-ud-dun. Following this came, in 1883, *Ottoman Poems*, the first to be translated into English. Others of Mr. Gibb's translations were: *The Story of Jewad* (1884); *The History of the Forty Vezirs* (1886); *Aucassin and Nicolette*, translated from the French of the twelfth century (1887). He wrote the articles on Ottoman literature in the *Encyclopædia Britannica*. During the last thirteen years of his life Mr. Gibb was engaged upon a *History of Ottoman Poetry*, which, projected as a five volume work, would have been an encyclopædia of Moslem literature; but only the first volume was published.

GIBRALTAR, a British crown colony commanding the entrance to the Mediterranean, has an area of only 1.9 square miles, and its population in March, 1901, was 27,460, of which 6,475 belonged to the military. The governor and commander-in-chief (General Sir George Stewart White in 1901) exercises all the functions of government, both legislative and executive, without the aid of councils. The revenues, for the most part derived from port dues, land rentals, and excise, amounted in 1900 to £61,418, and the expenditures to £61,812. The public debt is £19,253. The tonnage of the vessels entering and clearing at the port during 1900 was 8,750,000, being much above the average of the past five years. Almost three-fourths of this was British. The port is free and the transit trade is extensive. During 1900 rain-water reservoirs with a capacity of 5,200,000 gallons were constructed in the rock. More than usual interest attaches to the dock and harbor improvements, upon which the government is expending over £4,800,000, by reason of a report circulated during the summer of 1901 that it had been found that both dry-docks and coaling moles are directly under the fire of the Spanish guns at Algeciras.

GILBERT, Sir JOSEPH HENRY, English agricultural chemist, died at St. Albans, England, December 23, 1901. He was born at Hull, August 1, 1817, and was educated at the University of Glasgow, at University College, London, and in chemistry under Liebig at Giessen. After a short experience as a teacher he went, in 1843, to the chemical laboratory at the Rothamsted agricultural experiment station to become associate to J. B. Lawes. He remained here for fifty-seven years; Lawes died in 1892. The results of the joint labors of these two men are of the greatest value to agriculturalists. In 1884 Gilbert was appointed professor of rural economy at Oxford, a chair he filled for six years, while retaining his connection with the Rothamsted station. In recognition of his services he was awarded a medal by the Royal Society (1867), and in 1893 he gave a series of lectures in the United States, the provision for which was made by the Lawes Agricultural Trust. The results of the Rothamsted experiments have been published from time to time in the *Journals* of the Royal Agricultural Society of England, in the *Reports* of the British Association for the Advancement of Science, in the *Proceedings* and *Transactions* of the Royal Society of London, and in the *Journal* of the Horticultural Society of London.

GILLE, PHILIPPE EMILE FRANÇOIS, French journalist and playwright, died in Paris, March 19, 1901. He was born in Paris, December 18, 1831, and was trained as a stone-cutter. Later he entered the government service, and in 1861 was made secretary of the Théâtre Lyrique. After some years of journalism, on the staff of the *Petit Journal*, *l'Histoire*, *le Soleil*, and *le Figaro*, in which he wrote under the pseudonym of *le Masque de Fer*, he devoted himself to dramatic writing. As librettist he worked with Bizet on *la Prêtresse* (1854); with Offenbach on *le Docteur Oxy*

(1877); with M. Leo Delibes on *l'Ecossois de Chaiou, la Cour du Roi Pétaud* (1869); and with Jules Costé on *les Horreurs de la Guerre* (1869). Alone he wrote a one-act comedy, *Camille*, which was presented at the Théâtre Français in 1890. He also published a volume of poems, *l'Herbier* (1887), and a collection of articles from *le Figaro* under the title *le Bataille Littéraire* (1889).

GILLESPIE, ELIZABETH DUANE, American organizer of women's societies, died in Philadelphia, October 13, 1901. She was born in Philadelphia, January 15, 1821, the great-granddaughter of Benjamin Franklin, and in 1849 married Lieutenant Gillespie of the U. S. Marine Corps. During the Civil War she was in charge of one of the hospitals for wounded soldiers, and later was a member of the committee formed to raise funds for the Philadelphia Centennial, and had a large share in erecting and furnishing the Woman's Building. She was one of the founders of the Colonial Dames (1881), and was prominent in other Revolutionary associations. Mrs. Gillespie unveiled the tablet to Benjamin Franklin in the New York University Hall of Fame in 1901.

GILMAN, DANIEL C. G., president of the Johns Hopkins University since 1875, resigned this position September 1, 1901, and was enrolled by the trustees as president emeritus. He was succeeded by Ira Remsen, the professor of chemistry in the same institution. In the January following Mr. Gilman was chosen president of the Carnegie Institution of Washington, D. C. He holds some other important stations, among them that of president of the American Oriental Society, vice-president of the Archaeological Institute of America, president of the National Civil Service Reform League, president of the Slater Fund for the Education of Freedmen, and vice-president of the Peabody Education Board for Promoting Education in the South.

GIRLS' FRIENDLY SOCIETY was founded in England in 1875. Its purpose is to bring young women and girls together for social intercourse, to promote purity, uprightness, thrift, and faithfulness to duty. It was organized under the auspices of the Church of England. The movement has not been confined to England, however, but has extended, until now the society is established throughout the English-speaking world. The American society was organized two years after the inception of the movement and now has 370 branches, with a membership of about 20,000. Although the society is under the auspices of the Protestant Episcopal Church, no question of religious views is involved in membership. It is open to girls of all denominations. Associates, however, must be of the Protestant Episcopal Church. The American branch publishes the *Girls' Friendly Magazine*. The president is Miss Elizabeth H. Wisner, of New York; and the secretary, Miss Agnes D. Abbat, of Westchester, N. Y. The central office is at 281 Fourth Avenue, New York.

GLACIERS. H. F. Reid has, during the year 1901, published a paper on *The Variation of Glaciers*, in No. 6 of the *Journal of Geology* (vol. 9, page 250), in which he gives the records of a number of glaciers for 1899, and summarizes the *Fifth Annual Report* of the International Committee on Glaciers. The condition of the United States glaciers is also treated. He notes the discovery of a small one on Mount Arapahoe, in Colorado, which makes the second existing glacier known in that State. All of the other glaciers, including those in Alaska, show signs of retreat. On September 3, 1899, an earthquake shock on the Alaskan coast caused a large quantity of icebergs to break loose from ice extending down to the tide water. Muret and Finstewalde, in the *Sixth Annual Report* of the International Commission on Glaciers, give a summary of the condition of the glaciers of the Northern Hemisphere in 1900. Those of Switzerland are still retreating, there being but one exception, that of Boveyre, in the Val de Entremont. C. Rabot has published a paper entitled *Les Variations de Longueur des Glaciers dans les Régions Arctiques et Boréales*. (Archives de Sci. Phys. et Nat. Geneva, 1897-99.)

GLASGOW INTERNATIONAL EXPOSITION. This exhibition, which had for its object the presentation of the manufactures, products, industries, and material resources of all nations, and of the machinery and appliances relative thereto, and also of articles illustrative of science and art, including ethnology and archaeology, was held in Glasgow, Scotland, from May 1, 1901, to October 1, 1901. The site, which covered ninety-seven acres, was granted by the city corporation, and comprised the western portion of Kelvin Park and the Bunhouse grounds. The river Kelvin, which flowed through the grounds, was used for the exhibition of naval shipbuilding and life-saving apparatus, both in motion and stationary. The principal buildings were built from designs prepared by Mr. James Miller, and were four in number, as follows: a Fine Arts Gallery, an Industrial Building, a Machinery Building, and a Grand Hall for entertainments. The Art Gallery, which was a permanent building, cost about £250,000, and was built from the surplus and accumulated interest from the Exhibition of 1898, together with subscriptions from private citizens. The buildings, in which were shown the industrial and the machinery exhibits, were in the Spanish Renaissance style of architecture. The Industrial

Building was 700 feet long by 360 feet in width, and was crowned by a huge dome 80 feet in diameter. A wide avenue 92 feet in width and 150 feet in height extended longitudinally through this building, under a massive circular arched roof. The building had four towers, reaching a height of 180 feet above the ground level. Around the exterior of the dome, at a height of 100 feet above the ground, was a large balcony, from which an excellent view of the grounds could be obtained. The Machinery Building was 500 feet in length by 320 feet broad, and consisted of one central bay 100 feet wide, and four other bays, each 53 feet in width. The height of the central span was 41 feet, and that of the side spans 29 feet. The central bay was flanked on each side by an overhead gallery 15 feet wide. The exhibits were distributed among eight classes, as follows: Electricity, Fine Arts, History and Archaeology, Labor-Saving Machinery, Locomotion and Transportation, Marine Engineering, Sports, and Women's Industries. Among the foreign governments participating were Austria, France, Denmark, Japan, Mexico, Morocco, Persia, and the United States, and the various colonies of Great Britain, including Australia, Rhodesia, South Africa, and Canada, several of which had special buildings. During the time of the Exhibition numerous scientific organizations held their meetings in Glasgow, among which were the British Association for the Advancement of Science, the Institute of Mechanical Engineers, the Society of Chemical Industry, the Society of Engineers and Shipbuilders, and the Institute of Naval Architects. The University of Glasgow also celebrated the 450th anniversary of its foundation during the summer.

GLEASON, PATRICK JEROME, American politician, died at Long Island City, N. Y., May 20, 1901. He was born in Ireland in 1844, and came to the United States in 1859. After serving with credit through the Civil War in the Union Army, he settled in Long Island City and engaged in municipal politics. He was elected mayor in 1887, and while holding this office earned the title of "Battle-Axe" Gleason, by going out at the head of the city's police force armed with a huge axe and cutting away obstructing gates and sheds that a railroad company had erected in the streets. He served four strenuous terms as mayor of Long Island City, during which time he was the subject of many newspaper stories dealing with the unconventional methods of his administrative procedure.

GOETHALS, PAUL, head of the Roman Catholic Church in India, died at Calcutta, July 4, 1901. He was born in Belgium in 1833, and had a long and distinguished career in the church of that country before being sent to India. In 1878 he was nominated to the bishopric of Calcutta, and in 1886 was made archbishop of the same diocese, the most important in India, under the direct jurisdiction of the Propaganda at Rome.

GOLD. The production of gold in the United States in 1900 was valued at \$78,159,674, and its value in 1901 will probably exceed \$81,000,000. The following table, prepared from the estimate of the director of the mint, indicates the gold production by States for 1900 and 1901:

	1900.	1901.	Increase.
Colorado	\$29,500,000	\$29,000,000	*\$500,000
California	14,377,200	15,730,700	1,353,000
Alaska	7,771,000	6,904,400	*866,600
South Dakota.....	6,617,674	6,601,800	*15,874
Montana	5,126,615	5,023,300	*103,315
Arizona	3,500,000	4,193,400	693,400
Utah	4,237,726	3,824,300	*413,426

*Decrease.			

In 1900 the value of the gold production of the United States exceeded that of all minerals except pig iron and copper. The latter in this year had an unusually high value; consequently gold production should occupy normally the second place. The world's production of gold in 1900 was very nearly \$256,000,000, an amount which was exceeded in 1901. The United States leads in the production of gold, with Australia second, and Canada third. Most of the production of the last-mentioned country comes from the Yukon district and in part from southwestern British Columbia, with smaller quantities from western Ontario and Nova Scotia. Gold

GLASGOW EXPOSITION.—Opening of the Exposition by the Duke and Duchess of Fife.

mining in the Transvaal has naturally been almost at a standstill, but in spite of the war the production is likely to reach \$4,700,000, an amount which makes an interesting comparison with the output of 1898, which was valued at \$78,070,761. A moderate quantity of gold was produced in 1901 by Mexico and Central America, while the Dutch East Indies showed new developments that appeared very promising. There is a continued improvement in the sale of lower grades of ore as methods suitable for this treatment are being developed. The Cripple Creek region of Colorado and that of Leadville in the same State, doubtless had an increased production in 1901, but definite returns are not yet available. Along the Pacific coast the method of dredging gold from river gravels is growing in favor. In some cases these dredges are located on the rivers, while in others the dredge may be more than a mile from the stream. In such instances the dredge has often been built in an excavation which has been dug over the line of some buried river gravel and water is then let into the excavation to float the dredge. The gravel dredged is brought on board where it is discharged onto a coarse screen which separates the large stones, while the finer material, such as pebbles and sand, with the flakes of gold passes through the meshes and is washed over amalgamated plates and felt for the purpose of catching the gold. At the present time in the United States gold is being dredged in California, Washington, Idaho, Montana, Colorado, Utah, and Northern Georgia, while in foreign countries dredges are in operation in New Zealand, Australia, and more recently in the Urals. In the Black Hills of the South Dakota region the enlarging use of the cyanide process for treating gold ores has caused a considerable increase in the output of the district, but in Washington and Utah there has been a slight decrease in 1901. The Cape Nome gold deposits are now being worked more systematically and the output of gold from the American side of the Yukon is on the increase. In the eastern United States the same is true of North Carolina, but the reverse is found the case in Georgia. C. J. Alford, in a paper on *Gold Mining in Egypt (Mining and Metallurgy, 1901)*, describes the discovery of some ancient gold mines and milling plants in that country. An interesting article on gold-dredging in eastern Russia, by C. W. Purington and J. B. Lanfield, has been published in the *Engineering Magazine*, xxii, p. 399.

GOLD COAST, an English colony on the west coast of Africa, with sea front of about 350 miles on the Gulf of Guinea. Extending inland from the gold coast proper to a distance of about 300 miles from the sea is a protectorate comprising Ashanti and Adansi; the entire territory is bounded on the west and north by the Ivory Coast and the French Soudan, and on the east by Togoland, a German possession. The area of the colony proper (exclusive of Ashanti and Adansi) is about 40,000 square miles; the population is estimated at 1,500,000. The climate is malarial and very unhealthful for Europeans, and the white inhabitants number only about 500. The administration of the colony is in the hands of a governor, who is assisted by an executive and legislative council of six members with three other unofficial members. The governor in 1901 was Major Matthew Nathan. There is a commissioner and commandant of the northern territory of the Gold Coast resident at Kumassi, which is the main city of Ashanti. In 1901 Major A. H. Morris, who had commanded the garrison at Kumassi during the insurrection of 1900, held this position. The country is self-supporting; the receipts in 1900 were £585,583, an increase of £162,788 over the previous year. The expenditures were £515,567, an increase of £205,999 over 1899. The imports and exports, however, fell off in 1900, partially because of the trouble with the natives. The imports amounted to £1,294,963 and the exports £895,446. The chief articles of export in 1900 were rubber, £328,156; palm oil, £238,812; timber, £67,747; palm kernels, £96,936; cacao, £27,280. Gold is produced in considerable quantities. Most of the trade is with Great Britain. There are government schools at Accra, Cape Coast Castle, and Insein, but most of the education is in the hands of the Roman Catholic, Wesleyan, and German Reformed Missions, which direct schools comprising about 11,000 pupils. The principal towns are Accra (population, 16,276), Elmina (10,530), and Cape Coast Castle (11,614). These towns are lighted and policed. The government has built 700 miles of telegraph in the colony and has begun a railway from Sekondi harbor on the coast to Tarkwa, which is the centre of the gold-mining district. This road is to be pushed on to Kumassi, a distance of 180 miles beyond Tarkwa. In 1901 there was a considerable increase in mining activity in the Gold Coast. At Sekondi the number of prospectors, engineers, etc., that came on the steamers during the early part of the year was so great as to strain the accommodations. Considerable quantities of supplies and mining machinery also came to this port. There is a natural harbor at Sekondi, where landing can be made in keel boats. The *London Times* published a statement in May, 1901, that the plan for the removal of the government from Accra to Sekondi was being considered. A new steamship service is promised from Liverpool direct to the Gold Coast. This will place the region within thirteen days of England.

In 1901 the British government issued a blue-book upon the subject of the Ashanti war of the previous year, which threw new light on the causes of the uprising. It appears that the Ashantis, who by inheritance are a distinctively warlike people, had never become reconciled to the overthrow of their king, Prempeh, in January, 1896, and that subsequently they had continually chafed under the British yoke. They seem especially to have blamed themselves for permitting the submission of Prempeh without striking a blow in his defense. The evidences of British authority particularly disagreeable to them were the abolition of slavery and human sacrifices, compulsory labor on public works, fines for disobedience, and the increase of foreign traders. So great was the discontent that when in the latter part of March, 1900, a British force was dispatched to investigate conditions in the Atchima district, and also to capture, if possible, the "golden stool," the symbol of Ashanti royalty and power, rebellion broke out and the siege of Kumassi began. It appeared then, as had already been suspected, that the Ashantis for some time had been collecting military supplies and weapons. Early in 1901, 300 men of the West African Regiment, stationed at Kumassi, deserted and went to Cape Coast Castle. On March 31, 1900, troops left Accra for this place, and easily captured the mutineers; the ringleaders were shot and the others were shipped to Sherbro Island.

GOLF. Other than the extension of the restriction of the term amateur, which now disqualifies any person who "receives free transportation and free board, or whose club dues are either remitted by the club or not paid by himself," no alteration of importance was made in the rules in 1901. In the implements of the game a new ball, which differs from the old patterns by reason of having a small solid core of guttapercha, round which is wound lengths of thin thread-like india rubber, while over this is a guttapercha cover, was introduced in 1901. Travis used it in his championship match, and may have owed his success to it, for it doubtless drives farther than the old patterns. On the other hand, in inexperienced hands, it is over lively, and likely to be more detrimental than helpful. The men's amateur championship of the United States was held over the Atlantic City course September 9-14, 1901, and 124 started in the medal play round. On the third day the number of contestants was reduced to four: W. Egan, of Chicago; C. H. Seeley, of Weeburn; Findlay S. Douglas, of Nassau (L. I.); and Walter J. Travis, of Garden City. The final match between Travis and Egan, postponed on account of the death of President McKinley, was won by Travis, 5 up and 4 to play. The women's championship was played over the Baltusrol (N. J.) course October 8-12. The surprise of the medal play round was the failure of both Miss Griscom, the champion of 1900, and Miss Ruth Underhill, champion of 1899, to qualify. There were 82 entries, reduced to 16 by the medal test round. The final contest lay between West and East, Miss Genevieve Hecker, of Essex, N. J., defeating Miss Lucy Herron, of Cincinnati, 5 up and 3 to play. The general quality of the play was distinctly higher than that of any previous year. The open championship (i.e., open to professionals) was played over the Myopia course, and won by Willie Anderson, professional of the Pittsfield Club.

The following local and divisional championships were played: All Florida championship, won by Dr. L. H. Harban (Columbia); the Southern Florida championship, won by C. L. Tappin; the Southern California championship, Walter Fairbanks (Overland Park); Interscholastic, St. Paul's School team (L. I.); the Metropolitan championship, Findlay S. Douglas (Nassau Club); the New Jersey State championship, Allan Kennaday (Montclair); the Connecticut State League championship, C. H. Seeley (Weeburn); Colorado State championship, Frank L. Woodward (Overland Park); Western Golf Association championship, Philip B. Hoyt (Glen View); Maine State championship, Harris B. Fenn (Poland Springs); Massachusetts State championship, L. P. Myers (Yale); Pacific Coast championship, H. M. Sears (Los Angeles); Wisconsin State championship, Hamilton Vose (Milwaukee); the Intercollegiate Team championship, Harvard. The open championship of Great Britain (in which W. H. H. Hilton, the amateur champion played) was won by James Braid, Vardon was second, Taylor third, and Hilton fourth.

GORE, ALBERT AUGUSTUS, C. B., British surgeon-general, died at Whitchurch, Shropshire, March 11, 1901. He was born at Limerick, Ireland, December 1, 1839, and was educated in London, Paris, and Dublin. Joining the medical staff of the army in 1860, he served in the Sierra Leone operations, 1862-63, and distinguished himself in the yellow fever epidemic there in 1868, served in the Ashanti War, 1873-74, and afterwards as chief medical officer at various base hospitals in Egypt and central India. He became principal medical officer of the British army after the Indian campaigns of 1896-97, was retired in 1898, and created a commander of the Bath in 1899. He wrote a number of books, among which are: *The Story of Our Services Under the Crown* and *A Medical History of Our West African Campaigns*.

GORKY, MAXIM (Alexey Maximovich Pyeshkoff), a Russian novelist, whose studies of tramp life have been for some years familiar to the readers of his own country, and whose *Foma Gordyeyef* was translated into English in 1901, was born at Nijni-Novogorod, March 14, 1868 (or 1869). When still a young child he was left an orphan and was apprenticed to a shoemaker. In rapid succession the boy tried the life of an engraver's assistant, of a student of religious painting, of a scullery boy, and of a gardener's assistant, and at fifteen was assistant cook on a steamboat. While there he became interested in French romance, and he left the ship to try for an education in the schools. But failing to obtain free tuition, he took to the road as a tramp, and from that time, with occasional interruptions, he lived with tramps, going on foot over nearly the whole of Russia and living by turning his energy to whatever offered. In 1893 he first attracted attention by the publication of a short story called *Chelkash*, the success of which was immediate. Thereafter he devoted himself to writing, and has produced altogether more than thirty stories, dealing generally with tramps and the haunts of vagabondia. Gorky writes with sympathy and great realistic detail, depending more upon character drawing than plot for his effects. His stories are far from being cheerful, and the pen-name, "Gorky," which he adopted, translating into "bitter," suggests the tone of his most characteristic work.

GOT, FRANÇOIS JULES EDMOND, French actor, died in Paris, March 20, 1901. He was born October 1, 1822, at Lignerolles, in the department of Orne, and was educated at the Lycée Charlemagne. After holding a clerkship in the government service he entered the Conservatoire in 1841, where he studied under Provost and won second and first honors in 1842 and 1843 respectively. He served a year in the army, and then (1844) made his debut at the Comédie Française, of which he became a member in 1850. There he sprang into immediate fame as a comic actor. In his subsequent connection with the theatre, he enacted more than 150 rôles in the classical and modern drama. His connection with the Comédie was almost continuous until 1895, when he retired from the stage. M. Got wrote libretti for *François Villon* (1857), and *l'Esclave* (1874), and was made a knight of the Legion of Honor in 1881, being the first actor to be thus honored.

GOURKO, Count JOSEPH VASILYEVICH, Russian field-marshal, died at Tver, January 29, 1901. He was born in Lithuania, November 15, 1828. Entering the army in 1846 as cornet, he served through the Crimean War and the Polish insurrection of 1863, winning distinction in both conflicts, and in 1876 had risen to the rank of major-general with the command of a division. During the Russo-Turkish War (1877-78), General Gourko astonished the military experts of Europe by conducting a detachment of the army across the Balkan Mountains in the middle of winter,—a feat which had been deemed impossible,—took Sofia, Philippopolis, and Adrianople, and rendered signal assistance at the siege of Plevna in command of the Roumanian cavalry. In recognition of his services he was made a count, adjutant-general of the army, and in 1879, governor-general of St. Petersburg. In the following year, for not foreseeing and preventing an attack made on the life of Alexander II. he was exiled, but was recalled shortly afterward and appointed governor-general of the Polish provinces by Alexander III. in 1883. After a rigorous administration he resigned his office in 1894, and retired from public life with the rank of field-marshal.

GRAMME, ZÉNOBE THEOPHILE, inventor of the armature bearing his name, died in Paris, January 20, 1901. He was born in Belgium in 1826, and after working as a carpenter became connected with the "Alliance" factory in the capacity of mechanic and was engaged in the construction of dynamos and arc lamps, at that time used only for lighthouses or experimentally. He was also employed by Ruhmkorff, the celebrated Parisian instrument maker, and gained a knowledge of the principles involved in electrical machinery. His invention of the ring armature (1870) came a few years after Wild had discovered that the current from the revolving coils can be used to excite the field magnets. The principle of the ring armature had already been invented by Pacinotti, but it had not been brought to general notice or constructed in a practical form, so that when Gramme made his independent discovery of the same device he received the credit of the invention. He constructed successful dynamos which he exhibited at the international expositions of Vienna (1873), Philadelphia (1876), and Paris (1876 and 1888), and which, by showing their practical value, did much to make electric lighting general. For his work in electrical science Gramme received many honors.

GRAPHITE. The production of graphite in the United States in 1900 amounted to 5,507,855 pounds of refined graphite, and 611 short tons of crude graphite, having a total value of \$197,579. The production of 1899 was 2,900,732 pounds of refined and 2,324 short tons of crude, valued at \$167,106. There was also produced in 1900, 860,750 pounds of artificial graphite. The 1900 output came from New York, Pennsylvania, Michigan, and Rhode Island, and the great increase was due to Chester County, Pa.

In spite of the greatly increased output of the domestic mines the quantity produced was by no means sufficient to supply the demand and the imports continued to be large. In 1900 they were valued at \$1,390,141, which was seven times that of the domestic product. A review of the last few years shows that in 1897 the value of the imports was four times, in 1898 ten times, and in 1899 twelve times the domestic product. Most of the imported material comes from Ceylon and Bohemia, and Canada may become an important producer in the future.

GRAS, General BASILE, French soldier and inventor, died at Auxerre, France, April 15, 1901. He was born at Saint-Amans-de-Pellegrin, Tarn-et-Garonne, January 2, 1836, and entered the Polytechnic School in 1854. He became first lieutenant of artillery in the army in 1858, captain in 1864, and instructor of artillery officers. In 1871 the French War Department wished to change the system of armament, and Gras submitted a model of a rifle which was adopted and used until replaced by the Lebel model in 1886. In 1882 he became inspector of arms at Paris with rank of colonel, and was made brigadier-general in 1888.

GRAY, ELISHA, American electrician and inventor, died at Newtonville, Mass., January 21, 1901. He was born at Barnesville, O., August 2, 1835, and in his early life worked at carpentry and blacksmithing. At the same time he pursued scientific studies and attended Oberlin College. His first inventions included an automatic self-adjusting relay, a private line printer, a repeater, and a telegraphic switch and annunciator for hotels, but his most important discoveries were in the development of his system of electro-harmonic telegraphy for transmitting sounds over telegraph wires. He found that a sound produced near a magnet will cause a magnet with a similar adjustment to respond to its tone. On the basis of this discovery Gray filed a caveat at the patent office in Washington, with the ultimate idea of perfecting "the art of transmitting vocal sounds telegraphically." A month later the famous patent for the Bell telephone was granted to Professors Dolbear and Bell, and gave rise to almost endless litigation and controversy between these inventors and Gray. The claims of Bell as the inventor of the telephone were subsequently upheld by the Supreme Court, and the rights of the Gray invention, which were acquired by the Western Union Telegraph Company, were not utilized by this corporation, which, in return for a monetary consideration, conceded the claims of the Bell company. Gray invented the telautograph, and at the time of his death was interested in a new system for the transmission of fog signals. Shortly before his death he published *Nature's Miracles; or, Familiar Talks on Science, Vol. III., Electricity and Magnetism*.

GRAY, WILLIAM C., American religious editor, died in Chicago, September 29, 1901. He was born in Butler County, O., October 17, 1830, and graduated at Belmont College in 1849. He was admitted to the bar but did not practice, and in 1851 became editor of the *Miami Democrat*. Two years later he established the *Tiffin (Ohio) Tribune*; subsequently he was connected with the *Cleveland Herald*, and *Newark (N. J.) American*, and in 1871 he took the editorship of the *Interior*, an organ of the Presbyterian Church.

GREAT BRITAIN. The United Kingdom of Great Britain and Ireland has an area of 120,979 square miles, and a population in 1901 (see paragraph Census) of 41,454,578, of whom 30,805,466 were in England, 1,720,609 in Wales, 4,471,957 in Scotland, and 4,456,546 in Ireland. The executive power of Great Britain is vested in the king acting under the advice of a ministry nominated by him from the political party in power in Parliament. The main officers of the present Unionist ministry, which has held power since 1895 and was reelected in 1900, are as follows: Prime Minister, Marquis of Salisbury; Lord High Chancellor, Earl of Halsbury; Lord President of Council, Duke of Devonshire; Chancellor of the Exchequer, Sir Michael E. Hicks-Beach, Bart.; Secretary of State, Home Department, Charles Thomson Ritchie; Secretary of State, Foreign Department, Marquis of Lansdowne; Secretary of State, Colonial Department, Joseph Chamberlain; Secretary of State, War Department, Hon. St. John Brodrick; Secretary for Scotland, Lord Balfour of Burleigh; First Lord of the Admiralty, Earl of Selborne; First Lord of the Treasury, Arthur James Balfour; Lord Lieutenant of Ireland, Earl Cadogan; President Board of Agriculture, Robert William Hanbury; Postmaster-General, Marquis of Londonderry. The Church of England is the established church, but all other sects are tolerated.

Census.—By acts of Parliament approved on March 27 and April 9, 1900, the regular decennial census of the United Kingdom was ordered to be taken on March 31, 1901, and it was further directed that the preliminary reports of this census should be completed by August 27, 1901. As stated by the Census Commissioners, these preliminary reports, though not corrected, would probably differ from the corrected reports by so slight a margin as to be entirely negligible, and the preliminary reports are therefore here presented as if final. It appears from them that the total popula-

tion of the United Kingdom on March 31, 1901, was 41,454,578, an increase of 9.9 per cent. since 1801, when the population was 37,732,922. In both cases, however, this population is exclusive of the population of the islands of the British seas, and of sailors, soldiers, and merchantmen abroad. These additional categories amounted in 1891 to about 350,000, but the number was doubtless much larger in 1901, owing to the service of troops in the South African War. The following table shows the population, by decennial periods since 1821, of England, Scotland, Ireland, and Wales, and also of the United Kingdom:

Census Years.	England.	Wales.	Scotland.	Ireland.	United Kingdom.
1821	11,281,883	718,353	2,091,521	6,801,827	20,893,584
1831	13,090,523	806,274	2,364,386	7,767,401	24,028,584
1841	15,002,443	911,705	2,620,184	8,196,597	26,730,929
1851	16,921,888	1,005,721	2,888,742	6,574,278	27,390,629
1861	18,954,444	1,111,780	3,062,294	5,798,967	28,927,485
1871	21,495,131	1,217,135	3,360,018	5,412,377	31,484,661
1881	24,613,926	1,360,513	3,735,573	5,174,836	34,884,848
1891	27,483,490	1,519,035	4,025,647	4,704,750	37,732,922
1901	30,805,466	1,720,609	4,471,957	4,456,546	41,454,578

From this table it is shown that the population of the United Kingdom has doubled since 1821, and that the decennial rate of increase has been fairly constant. But if the rate of increase in each of the four countries is considered separately, it will be seen that the population of England and Wales has increased proportionately more rapidly than that of Scotland, while the population of Ireland shows a large positive decrease in every decade since 1841, when the great famine occurred, the total population amounting in 1901 to hardly more than one-half of the population sixty years previous. The following table shows by per cents. the increase in the population of the United Kingdom since 1821, and also the increase or decrease in each of the four countries, England, Ireland, Scotland, and Wales:

	1821-31	1831-41	1841-51	1851-61	1861-71	1871-81	1881-91	1891-1901
United Kingdom.....	15.0	11.2	2.5	5.6	8.8	10.8	8.2	9.9
England	16.0	14.6	12.8	12.0	13.4	14.5	11.7	12.1
Wales	12.2	13.1	10.3	10.5	9.5	11.8	11.6	13.3
Scotland.....	13.0	10.8	10.2	6.0	9.7	11.2	7.8	11.1
Ireland	14.2	5.5	-19.8	-11.8	-6.7	-4.4	-9.1	-5.3

The decrease in the population of Ireland is seen to be the smallest since 1841, amounting numerically to 248,204. This decrease was almost entirely in the rural districts, the large towns showing on the whole considerable increase. The population of Belfast, for example, increased from 273,079 to 348,965, or 27.8 per cent.; that of Dublin from 269,716 to 286,328, or 6.2 per cent.; that of Cork, from 97,281 to 99,693, or 2.5 per cent.; that of Rathmines and Rathgar from 27,796 to 32,472, or 16.8 per cent., and that of Pembroke from 23,992 to 25,524, or 6.4 per cent. Many of the smaller towns on the other hand reported a considerable loss of population. Of the total population, 74.3 per cent were returned as Roman Catholics; 13.0 per cent as Protestant Episcopalians; 10.0 per cent as Presbyterians, and 1.4 per cent as Methodists. In comparison with the numbers reported under these religions in 1891, there was a decrease among the Catholics of 6.7 per cent.; a decrease of 3.5 among Episcopalians, of 0.3 among Presbyterians, and an increase of 10.4 per cent among Methodists.

As was shown by the previous census, the urban population of England and Wales continues to increase more rapidly than the rural, the increase conforming roughly to the rule that the more populous the city, the higher the rate of growth. In the ten years ending in 1901 the proportionate increase was greatest, not among towns of from 20,000 to 100,000 inhabitants, as was the case in 1881-91, but among cities of from 100,000 to 250,000 inhabitants. By the earlier census towns of more than 250,000 inhabitants showed an increase of 9.28 per cent., but by the census of 1901 the per cent. was 12.48. At the same time towns of from 20,000 to 50,000 showed a lessening increase in population, while among the towns of less than 10,000 there was "on the average a somewhat serious decrease." All told there were in England and Wales, as shown by the census of 1901, 75 towns each containing more than 50,000 inhabitants. The largest twenty of these, their population at the census of 1891 and 1901 and their rate of increase, is as follows:

URBAN DISTRICTS OR TOWNS.	ENUMERATED POPULATION.		Increase per cent.	URBAN DISTRICTS OR TOWNS.	Enumer- ated.	Popula- tion.	Increase per cent.
	1891.	1901.			1891.	1901.

* The areas of these towns were extended in the decennial 1891-1901, but in every case the population given for 1891 relates to the population of the town as it would have been if constituted as in 1901.

With the exception of the figures returned for Ireland, the report of the census was in general satisfactory. For the total population, at least of England and Wales, was larger by over 150,000 than had been estimated on the basis of previous decennial increases, and besides this a considerable increase should be allowed over the census figures on account of the troops in South Africa. In general then, the returns showed that the country had not yet reached the "saturation point" as to population, and this alone gave satisfaction in view of the many discussions that had appeared of recent years in the English press as to the increases in wealth and population which could be expected alone of countries of immense area such as the United States and Russia. While again the census returns show that there has been an influx of population to the towns, the figures show also that this tendency has not been so marked as was believed. "Few even of the purely agricultural counties have actually declined. Bedfordshire, Berks, Bucks, Dorset, Somerset, Wilts, and Worcestershire show increases, some of them considerable." Taken broadly, few large areas of the country show any considerable decline in population; the total increase of the country being on the whole uniformly distributed. "Active progress of population has been restricted to little more than four millions of acres out of thirty-seven, and in a measure the face of the country is little changed." It should be noted, however, that one of the most pronounced tendencies shown by the census is the increase of suburban districts. Around many large towns a sort of suburban or semi-rural ring has been formed, whose people are dependent upon the town and yet apart from it. This tendency is shown in the marked growth of several counties. "That of Essex has risen from 578,471 to 816,524; Kent, a little less favored, shows an increase from 807,328 to 936,003; Middlesex which had in 1891 a population of 542,894, returned 792,225; and Surrey shows a rise from 409,115 to 519,522." As shown by the census, the increase in population resulted not from an especially high birth-rate but from a rather low birth-rate, and also a low death-rate. From this fact various deductions were made reaching very different conclusions. The returns of the census in Ireland, while not surprising, were nevertheless distinctly disappointing. While it was well enough to say that the decennial decrease there was the smallest for fifty years, it nevertheless remained true that the more a population in the country had declined, the less it could afford to decline.

Finance.—The revenue for the year ending March 31, 1900, excluding the local taxation accounts, amounted to £119,000,840. The ordinary expenditure amounted to £110,505,000, and the expenditure including war charges aggregated £133,722,000, leaving a deficit for the year of £13,882,000. For the year ending March 31, 1901, the revenue was £130,385,000. The ordinary expenditure for that year amounted to £114,972,000, leaving a surplus of £15,413,000. But the total war charges for the year were £68,620,000, leaving a net deficit of £53,207,000, which was met by the issuing of loans. For the fiscal year ending March, 1902, the total estimates of expenditure were placed by the chancellor of the exchequer at £184,212,000, providing that payments on the sinking fund amounting to £4,640,000 were suspended. The total estimates of ordinary revenue were placed at £132,255,000, or together with other duties which it was proposed to levy, at £143,255,000, thus leaving a deficit of £40,957,000. To supply this deficit, Parliament authorized the issue of loans up to £60,000,000. The total cost of the wars in South Africa and China for the years 1899-1902 were estimated by the chancellor to be £153,317,000. Of this amount, £142,807,000 was for operations in South Africa, £5,660,000 was for operations in China, and £4,850,000 represented interest on the war debt. Of this total amount, £45,271,000 had been or would be provided for by previous surplus, suspension of

the sinking fund, and additional taxation, while loans would aggregate £108,046,000. (See paragraph Customs and Excise Law.)

The National Debt.—On March 31, 1901, the total gross liabilities of Great Britain amounted to £705,723,878, divided as follows: Funded debt, or debt which the government is not obliged to pay within any fixed period, £551,182,153; unfunded debt, representing money borrowed on short time, £67,000,000; terminable annuities, being the present cash value of debt in process of extinction through the payment of annuities, £61,677,469; other capital liabilities, £14,731,256. But from the sum total as thus made up, must be deducted assets amounting to £32,115,676, of which the main items are: Bank balances, £5,596,918, and Suez Canal shares, £25,806,000, leaving the net total debt at £673,608,200. The debt of Great Britain is of long standing, the first loan having been made by Charles II., though this was partially repudiated. The debt was never large, however, until the American Revolutionary War, which cost £121,000,000, and made the debt nearly £250,000,000. This was reduced somewhat up to 1793, when the Napoleonic wars added £600,000,000, and left the total debt in 1816 over £900,000,000. Since then a regular system of repayments has been adopted, and the debt has not been allowed to rise to its former size. During the reign of Queen Victoria, and up to March 31, 1899, the debt was reduced in the sum of £153,000,000; but this amount was almost precisely the cost—£153,317,000—of the South African War and the army operations in China for the three years ending March 31, 1902. Of this cost, £45,271,000 was charged to current revenue, and £108,046,000 raised by loans, neutralizing over two-thirds of all the payments made on the national debt since 1837.

Army.—The total army budget for the last four years has been as follows: For the year ending March 31, 1899, £19,220,500, of which £16,139,800 was for the effective service; for the year 1900, £20,617,200, of which £17,553,000 was for the effective service; for the year 1901, £61,499,400, of which £58,323,400 was for the effective service, and for the year ending March 31, 1902, £87,915,000, of which £83,970,500 was for the effective service.

The following figures show the normal distribution of all ranks of the actual effective service: In Great Britain, 154,333; in Egypt, 5,312; in the Colonies, 43,709, excluding 14,435 native and Colonial troops; and 73,518 in India. (See paragraph Army Reorganization).

Navy.—The total naval estimates of Great Britain for the last four years have been as follows: For the year ending March 31, 1899 (effective service, £21,549,800, non-effective, £2,228,600), £23,778,400; for the year 1900 (effective service, £24,302,000, non-effective, £2,292,500), £26,594,500; for the year 1901 (effective service, £26,476,800, non-effective, £2,315,400), £28,791,900; and for the year ending March 31, 1902 (effective service, £28,603,900, non-effective, £2,271,600), £30,875,500. This steady increase in the naval appropriations was stated by Mr. Arnold Foster, Secretary of the Admiralty, to be necessary in order to maintain the superiority of England's naval force over that of any two foreign powers. There had, the secretary stated, been deplorable delay in the building of ships ordered, but after inquiry it was found that other countries had suffered practically the same delay. It was questioned in the House by the opposition whether the statement still held good that the English naval force was superior to that of any other two countries. France, it was asserted, had 40 battleships completed, or nearly completed, while Russia and Germany had 29 each, and Great Britain had only 66, thus giving to France when combined with Russia or Germany a superiority over Great Britain of three battleships. The secretary, however, declined to change the year's programme for the construction of new vessels, and it was adopted by the House as presented. This programme called for three battleships, six armored cruisers, two third-class cruisers, ten torpedo boat destroyers, five torpedo boats, two sloops and five submarine boats. The personnel of the navy under the new estimates was to consist of a total of 118,635, being an increase of 3,745 over the previous year. With regard to the efficiency of the navy, the secretary stated that there had been struck off from the list of so-called effective ships sixteen vessels, but there still remained on the list a number of ships armed or partially armed with muzzle-loading guns, and that these must remain there until replaced. An excited discussion as to the efficiency of the navy arose from a statement of the Navy League on June 26, 1901, reiterating their statement of October 20, 1900, and showing that (1) the naval programme of late years had been insufficient for England's safety, that (2) these insufficient programmes had been only partially carried out, and that (3) the relative naval strength of Great Britain was being steadily diminished by increase in the naval construction of other nations. "No more dramatic contrast exists," said the League, "than that presented by the actual conditions of the main fighting fleet of Britain and the belief held by the public at large as to their sufficiency and efficiency." "In the Mediterranean, where the battle for empire will probably be fought out," there is a deficiency in all classes of vessels, and a complete absence of fleet auxiliaries of all kinds. So far as the

personnel of the navy is concerned, "the spirit of duty and sacrifice reigns from the top to the bottom of the service." "The defects of the navy are due solely to civilian neglect ashore." And of these defects the chief, according to the Spectator's résumé of the League report, was that "the Lords of the Admiralty are overworked, overwhelmed with detail, have no time to think, and that there is no department corresponding to the German General Staff, where the quality prevision is exercised at leisure and while England is at peace." In the discussion on this manifesto which took place in the House of Commons, the government took the position that although there were only ten British war ships at present in the Mediterranean squadron, of which one was always on the retired list, yet it was absurd to state that in times of peace the British vessels in the Mediterranean should always be equal to the war vessels of any other two European powers. On mobilizing for war, the British Mediterranean fleet could be largely increased, and in any event it was untenable to take the point of view that the Mediterranean constituted a strategical unit by itself. On the first of April, 1901, the effective fighting fleet of Great Britain as compared to the other principal nations was as follows: Great Britain, 45 battleships built and 14 building; Germany, 19 battleships built and 9 building; France, 30 built and 4 building, and Russia, 17 built and 8 building. Cruisers, Great Britain, 129 built and 20 building; Germany, 23 built and 8 building; France, 40 built and 15 building, and Russia, 14 built and 11 building. Besides these, Great Britain had built 17 coast defense vessels, Germany 19, France 14, and Russia 15.

Agriculture.—The general average of production of the staple cereal crops in Great Britain for 1901, except in the case of wheat, was lower than in 1900, and below the average of the ten years preceding. This reduction was shown both in acreage and in average yield per acre, except in the case of wheat, and even in this staple there was a falling off in the number of acres planted. Weather conditions were unfavorable. Scotland maintained a better average in per-acre returns than either England or Wales. The following table shows the officially estimated production of the principal cereals in 1901, as compared to 1900, with a comparison of the yield per acre to the average for the ten years preceding:

WHEAT.	TOTAL AMOUNT PRODUCED.		ACREAGE.		YIELD PER ACRE.		Average Yield— 1891-1900.

In contrast to the decline of acreage in cereal crops, the areas under orchards have steadily increased from 224,116 acres in 1897 to 234,660 in 1901. The number of acres under clover and rotation grasses for 1901 was 4,856,387, and under permanent pasturage 16,827,249, as compared with 4,759,158 and 16,729,035 for 1900.

Mineral Production.—Definite statistics as to the production of coal in Great Britain in 1901 are not available owing to the difficulty of obtaining figures on the home consumption. But the most reliable official estimate stated the total as nearly 225,000,000 tons, the figure for 1900. The export in 1901 was 43,766,552 tons, as against 46,098,228 tons in 1900. Of the 1901 total of exports, 808,061 tons were in the form of coke, 1,080,146 tons briquettes, and 41,878,345 tons ordinary export coal. The falling off in the amount of export was due to the imposition of a coal export tax of a shilling a ton, and the relative smallness of the decrease is explained by the fact that certain concessions were made to the shippers. In December, 1901, the government appointed a royal commission to investigate the coal supply of Great

Britain. Mining wages declined considerably during 1901, in sympathy with the fall in the price of the mined product. In Wales, where the automatic sliding scale prevails, wages fell 8 per cent. with every fall in price of one shilling a ton. Taking this as a basis, and considering that the price of export coal fell from 16.51 shillings per ton in 1900, to 13.91 shillings in 1901, it would be fair to say that there was a reduction of 20 per cent. from the scale of 1900.

Speaking broadly, the iron and steel trade of Great Britain in 1901 suffered in imports of ore, in exports of iron and steel, and in the amount of finished product. The imports of ore, which came from twenty different countries, amounted to 5,546,845 tons, being a decrease from 1900 of 751,118 tons, or 12 per cent. The price of ore in November was 15.25 shillings per ton, against last year's average of 14.67 shillings per ton. The value and amount of the finished iron and steel and machinery imported into Great Britain was £10,259,056 for 923,677 tons, against £9,284,436 for 799,674 tons in 1900. The early part of the year saw a revival in the manufacture, due to the decline of wages, railway charges, and the price of coke, but it fell off again. The exports of iron and steel of every kind amounted to 2,900,100 tons, of a total value of £25,305,673, a decrease from 1900 of 640,589 tons, of a value of £1,687,002. These exports were made up of 839,223 tons of pig iron, 574,656 tons of rails, and 1,486,221 of machinery and other forms. The total production of iron and steel was 8,200,000 tons, representing a decrease from 1900 of 708,570 tons. Most of the decrease was in steel. The iron ore lifted was about the same in quantity as in 1900, that is, slightly over 14,000,000 tons. One significant fact in connection with the export trade in iron and steel is that in 1901 practically nothing was sent to Germany, one of Great Britain's best customer before. On the other hand, Germany actually shipped some thousands of tons of iron ore to Great Britain.

Ship-Building.—The total number of steamships and sailing vessels of the world of 100 tons register and over was estimated by Lloyd's Register for 1901 at 29,091, and their total tonnage at about 30,600,510. Of this total the United Kingdom had 13,656,161 tons, and the colonies, 1,052,045, giving a total British tonnage of 14,708,206. The United States came next to Great Britain in the aggregate amount of their shipping tonnage, having 3,077,344 tons, and Germany followed with 2,905,782 tons. But if the steamships alone of the world were considered, the United States fell to third place; the total estimated steam tonnage in the world being 24,008,883 tons, of which the United Kingdom, together with her colonies possesses 12,739,180, Germany 2,417,410, and the United States, 1,704,156. During 1900, 692 ships with a tonnage of 1,442,471 were launched in the United Kingdom, of which 28 were sailing vessels with a tonnage of 9,871. In addition to this, there were launched 29 warships with 68,364 tons displacement, of which 20 vessels with a tonnage of 35,050 were for the British government. Of the total construction in the United Kingdom in 1900, 1,109,165 tons, or nearly 77 per cent. were intended for the trade of the United Kingdom. Of the remaining vessels, Germany supplied the largest number of orders, aggregating 103,625 tons; Austria-Hungary followed with orders for 80,426 tons; Holland, for 24,403 tons; France, for 21,034 tons, and Spain for 19,038 tons. The net increase in the tonnage constructed in Great Britain in 1900 over that of 1899 was about 220,000. According to a writer in the *Financial Review*, there were 680 vessels built in 1901 with an aggregate tonnage of 1,736,708 tons, of which 41 vessels with a displacement of 211,969 tons were warships. On the other hand, it is expected that shipbuilding for the year 1902 will show a large decrease, and an indication of this and of the present glut in the shipping market is shown by the fact that freights had fallen by the end of the year so that they were hardly more than half what they had been in 1900.

Trade and Commerce.—The trade of Great Britain for the year 1901 was on the whole satisfactory, especially when it is considered that industrial conditions in Europe were gravely disturbed, thus tending to reduce England's export trade, while the continuance of the South African War and the large government loans necessitated by it reduced the amount of capital in the country available for mercantile transactions. The exports for the year were £280,498,889, a decline of £10,673,107 from 1900. The imports also showed a slight decrease, their total value in 1901 being £522,238,986, a decline during the year of £836,177. The largest declines in exports were in raw materials, principally coal, the total decline in raw materials being £8,501,365. Manufactures of metals also showed the large decrease of £5,933,147 from the preceding year. On the other hand, articles of food and drink were exported to a value exceeding by £1,263,160 the total values of 1900. Probably the most interesting feature of the year in manufactures was that connected with the coal situation. Owing largely doubtless to the South African War and the extraordinary demand for coal both for the transports in the government service and for domestic industries manufacturing materials of war, the price of coal rose so high in the latter part of 1899 and in 1900 as seriously to handicap general manufactures. It was also alleged that the coal dealers were taking advantage of the necessities of the

government to coin excessive profits at the expense of the country. For this season, the shilling export tax on coal advocated by the chancellor of the exchequer and sanctioned by Parliament (see paragraph Customs and Excise Taxes) met with very general approval throughout the country, although the coal dealers complained bitterly that they could not export coal at a profit under it. Nevertheless events proved that the export tax did not seriously interfere with coal exports, the lessened exports for 1901 being readily accounted for by the lessened ability of Europe to buy coal during the year. On the other hand, the fall in domestic prices of coal caused by the export tax tended to stimulate increased production in industries where the price of the products depended largely upon the cost of fuel. The iron and steel industries during the year were hardly satisfactory. Exports of iron and steel of every kind for the year amounted to 2,900,100 tons, showing a falling off from the previous year of 640,589 tons, with a decline of value of £6,687,002. As regards finance, the great interest of the year in Great Britain centred around the borrowings of the British government for purposes of the South African War. In February, £11,000,000 of 3 per cent. bonds were negotiated and in April, an issue of £60,000,000 was made. These bonds were all heavily over-subscribed, although the price of consols fell to 92, whereas it had been 114 before the war. At the same time that the British consols fell, the stocks of several of the largest British railways fell also. This was partially owing no doubt to the fact that so much of the country's capital was being tied up directly or indirectly in industries connected with the war, and partly also to the fact that on account of the increase in the price of coal and materials, the British railways were forced to cut their dividends heavily. How heavily some of the largest railway stocks declined may be seen from the fact that London and North Western fell from 180 to 158, North Eastern, from 172 to 149, Great Western, from 169 to 131, and Lancashire and Yorkshire, from 132 to 104. Notwithstanding these declines, however, both in consols and in railway stocks, which have habitually been looked upon as most stable investments, financial conditions in England were very little disturbed throughout the year, and there was no stringency in the money market.

In the following table are given the total exports and imports of Great Britain for the calendar year 1901 and also the decrease or increase of each class of exports or imports from the preceding year. This table has been compiled from the returns made by the British Board of Trade.

IMPORTS FROM FOREIGN COUNTRIES AND BRITISH POSSESSIONS, 1901.

	Value.	Increase over 1900.	Decrease from 1900.
I. Animals, living, for food.....	£ 9,400,083		£222,286
II. A—Articles of food and drink, duty free.....	162,949,666	£8,869,578

EXPORTS OF FOREIGN AND COLONIAL MERCHANDISE, 1901.

Total	667,846,843
Increase	4,665,085

The following table shows for ten years the imports, exports, and total commerce of Great Britain and the United States:

YEAR.	*Imports of Great Britain	Imports of the United States	†Exports of Great Britain	†Exports of the United States	‡Total Commerce of Great Britain	‡Total Commerce of the United States
1891 ..	\$1,000,122,000	\$84 186	\$1,105,888,000	\$220,297,315	\$2,421,302,079	\$1,779,351,615
1892 ..	1,000,212,000	77 184	1,083,043,000	224,739,454	2,317,787,496	1,842,387,708
1893 ..	1,007,007,000	87 141	1,061,086,000	227,116,116	2,319,247,874	1,801,418,169
1894 ..	1,007,614,000	80 147	1,110,339,000	1 115	2,418,472,300	1,020,629,483
1895 ..	1,148,842,000	88 166	1,108,660,000	1 180	2,601,802,702	1,007,416,797
1897 ..	2,104,707,000	74 189	1,139,715,000	1,1 190	2,620,156,174	1,042,304,274
1898 ..	2,100,000,000	88 146	1,138,828,000	1,1 140	2,719,634,280	1,000,610,784
1899 ..	2,380,380,000	79 110	1,207,640,000	1,1 144	2,964,601,264	2,074,436,381
1900 ..	2,448,288,000	82 197	1,418,198,000	1,1 189	2,904,648,579	2,308,900,000
1901 ..	2,541,476,025	88 206	1,808,047,848	1,1 119	2,008,829,889	2,346,801,976

*The figures given for the imports and exports of Great Britain are calculated only in round numbers and may each vary from the correct amount to a maximum of \$2,000, but the variation is usually considerably less. The figures for the total commerce of Great Britain are believed to be exact.

†The figures given for exports do not include the exports of merchandise produced outside of the country, that is, merchandise which has been imported to the country and is then re-shipped and exported. In the case of Great Britain the amount of merchandise so re-shipped has averaged yearly since 1880 nearly \$300,000,000. In the case of the United States re-shipped merchandise has increased by fairly equal amounts from \$12,000,000 in 1880 to \$25,000,000 in 1900.

‡The figures given for total commerce are found by adding together the figures for imports and exports, but the exports are here taken to include both the exports of merchandise of domestic production and the exports of merchandise of foreign production, that is, both true exports and re-shipments.

The question of German, and more especially, of American competition with British manufactures which was first seriously considered in 1900 was discussed with no less interest in 1901. Notwithstanding the fact that the total commerce of Great Britain, with a population hardly more than half that of the United States, and a country incomparably inferior to the United States in natural resources, enjoys nearly double the total commerce of the United States, there were loud complaints in the English press during the year to the effect, not merely that Great Britain's commercial supremacy would be taken from her, but that it had already been taken from her, and that Great Britain must henceforth follow the industrial lead of other nations. That Great Britain can no longer produce either coal or steel and iron manufactures to the extent of those produced in the United States and that her exports of these articles must fall behind those of the United States may be readily admitted; but that any marked decadence is shown in British industries taken as a whole was seriously questioned by many. On the other hand, it was nowhere denied that both British employers and employees might in several particulars copy American patterns with great advantage to themselves; for from a long array of undisputed facts, it appears that labor in England is sadly lacking in mobility, and capital in initiative. Owing largely to the fact that workmen in Great Britain are minutely subdivided in trades and trade unions and that each trade union has very strict regulations for the admission of apprentices and the government of journeymen, English laborers find it very difficult to shift from one kind of work to another. A sort of caste system appears to be the foundation of the whole industrial situation; so that each man, finding it of extreme difficulty to force an entrance into any other trade than that in which he has been bred, demands that his particular kind of work in any trade shall not be curtailed. Therefore, the laborer bitterly resents the introduction of labor-saving machines which tend to destroy any subdivision of manual labor in a particular trade or to diminish the number of workmen required in that particular subdivision. Acting upon the principle that there is just about so much work to do and so many men to do it, the laborer opposes any addition to production per capita. That is to say, while in the United States the unions insist only that wages shall not be cut below a certain point, but concede that more work will be done if the wages are correspondingly raised, the British workman only demands a minimum wage and will not allow his fellow workmen to receive more money for more work done. Similarly, there seems to be no doubt that while the workmen have in many cases dissuaded employers from introducing labor-saving machines, the British employer himself looks with a certain fondness upon the antiquated instruments of production which his father or grandfather used, and is loth to throw them away. The

principle adopted in all large American industrial establishments that no matter how expensive the present machinery is, other machinery must at once be substituted if it will pay a higher return on the capital invested, is not readily conceded in Great Britain. All told, however, there is stated by many writers to be something ridiculous both in the complaints made by Great Britain that its commercial victories have departed from it, as well as in the boasts of some American writers that Great Britain may no longer be considered as a serious obstacle to the progress of American industries abroad.

As in previous years, much comment was excited in the United States by the fact that British imports were so vastly in excess of British exports. How could a nation, it was asked, continually buy when it does not sell without eventually going into bankruptcy? While this question was not satisfactorily answered, it might be stated as a partial explanation to which measure many similar facts could be added that the capital in London alone employed in foreign banking enterprises in the East approximates £200,000,000.

HISTORY.

Parliament.—The first session of the 27th Parliament (an extra session) met on December 3, 1900, in order to vote the government further supplies for the prosecution of the war. It then adjourned on December 14 until February 14, 1901, but was reconvened on January 23, 1901, on the demise of the Queen, in pursuance of the law requiring Parliament to meet immediately on the death of the sovereign. Members of both Houses took the oath of allegiance to the new sovereign on January 24, and on January 25, a message having been received from King Edward announcing the Queen's death, a message of condolence was voted by Parliament. Adjournment was then taken until February 14, when the King, accompanied by Queen Alexandra, journeyed in pageant form from Buckingham Palace to Westminster and opened Parliament in person. In the message from the throne, the King stated that the cessation by the Boers of the guerrilla warfare which they were maintaining would be as much to their own interests as to Great Britain's, as until that time it would be impossible to establish in the South African colonies institutions securing equal rights to all the white inhabitants and protection and justice to the native population. The King stated that, notwithstanding the death of the Queen, the establishment of the Australian Commonwealth would be commemorated by the opening of its first Parliament by the Duke of Cornwall and York. With regard to new legislation, the Crown stated that bills would be laid before Parliament for regulating the voluntary sale of land to tenants in Ireland, for amending and consolidating the factory and workshop acts, for amending the law relating to education, and the public health acts, and for the prevention of drunkenness. With reference to the new civil list which the demise of the Crown made necessary, the King announced that he unreservedly relinquished his hereditary revenues as had his predecessor, Queen Victoria. The session of 1901 was very similar to that of 1900, in that it consisted largely of discussions upon the Boer War and of collateral questions arising therefrom, including the question of the best means of defraying the war expenses. In so far, however, as concerned measures of domestic reform, the session was disappointing, few acts of importance being passed. The opposition as a party showed even less coherence than in the previous session. On the other hand, the Conservatives showed such extraordinary negligence that on several occasions their majority was unpleasantly reduced, and on the voting of an amendment to the consolidated factory law, they were openly defeated. Besides the civil list act, the voting of supplies for the army and navy and the army reorganization bill, which are treated in separate paragraphs, the measures which appeared to occupy the greatest amount of time were those connected with royalty and the approaching coronation. After the opening of Parliament, a letter signed by thirty Catholic peers was presented, praying that the King's declaration, in which he was required, by existing law, to stigmatize as "idolatrous and superstitious" the belief of his twelve million Catholic subjects might be in some way modified. Committees were appointed to this end by both Houses, and various amendments were proposed in order that the King, while still unequivocally asserting his position as head of the established church, might yet not give offense to those of a contrary belief. But to the proposed amendments the established church objected that they did not sufficiently safeguard the Protestants, while at the same time the Catholics maintained that the offensiveness of the declaration was not removed. And in the end the declaration was allowed to remain as before. An act receiving royal approval on August 17 permitted the King to alter his royal title in his own discretion, so as to give recognition to his British possessions beyond the seas. In accordance with this act, King Edward adopted a complete title, as follows: "Edward VII., by the Grace of God of the United Kingdom of Great Britain and Ireland, and the British Dominions beyond the Seas, King, Defender of the Faith, Emperor of India." Other events of the

EDWARD VII.

QUEEN ALEXANDRA.

session were the trial of Lord Russell in the House of Lords on a charge of bigamy; the heaping of honors upon Alfred Milner (*q.v.*), and the donation to Lord Roberts, the commander-in-chief of the army, of £100,000 for his services during the South African War, although the South African War showed no symptoms of completion. The discussions rising out of the session as regards the Irish and Liberal parties, as well as the measures passed, will be found in succeeding paragraphs. In proroguing Parliament on August 17, the King regretted the continuance of the South African War; stated that the enthusiastic reception that had been accorded the Duke and Duchess of York in every colony they had visited was an additional proof of the patriotism, loyalty and devotion of the people of his dominions over the sea, and felicitated Parliament on its liberal provision for the naval and military service, for the maintenance of the dignity of the Crown, and for authorizing the King to make such additions to his title as he deemed proper. See EDWARD VII. and VICTORIA.

The Liberal Party.—The Parliamentary session of 1901 (see paragraph Parliament) was admitted even by its friends to have been exceptionally lame in results, and at least a partial cause of this was ascribed to the fact that the Liberal opposition had shown itself during the session to be powerless either in forcing the government to initiate new measures or to amend measures that had once been proposed. In fact, as was commonly stated, the basis of government by Parliament required an effective opposition, and lacking this, no party in power could be held to its duty. While the Liberals did not agree that their present disunited and disorganized condition was responsible for the small amount of effective legislation enacted by Parliament, they did generally agree that some means should be taken to draw the Liberal party into a more effective union and to enunciate some principle upon which the various segments of the party could stand upon a common footing. At a meeting of the Reform Club on June 14, conciliatory speeches were made by the leaders of the party, and a vote of confidence was passed in Sir Henry Campbell-Bannerman, the Liberal leader. But in a letter on July 16 and in a speech on July 19, Lord Rosebery (*q.v.*), premier of the Liberal government in 1895, derided the conciliatory efforts made at the Reform Club and termed the whole meeting a manifestation of "organized hypocrisy." There could be no peace, he said, within the party, and no effective action by it until an agreement was reached in the matter of the war and the maintenance of the empire. The Liberal leaders had concluded that this was a transient subject on which they might agree to disagree. Fox also had thought the issue unessential when he opposed the great war with France. "But in spite of his vast abilities and uncreditable charm, he split his party and excluded it from power for nearly forty years." The truth was that statesmen who disassociated themselves from the nation in such a national question as war, where all strove and suffered together, disassociated themselves for much longer than they thought. The issue was in fact supremacy calculated to create new parties, much more to destroy an old one. For himself, Lord Rosebery said, he equally approved the purpose and condemned the methods of the war. No impartial observer remembered any government which had carried into its administration such a frightful assemblage of error, weakness, and wholesale blunderings as had the present Conservative one. But until the Liberals determined definitely for or against the empire, of which there seemed no immediate prospect, a weak government was likely to be confronted by a weaker opposition.

This manifesto of Lord Rosebery's, for it could not be considered less, met with an immediate approval from the stronger portion of the press in so far at least as the speech purported to give an accurate description of the existing status of the two parties. But it was pointed out that if Lord Rosebery himself had never said a foolish thing, he had rarely done a wise one, and that his baiting of his own party without at the same time offering any cure for the disease he had diagnosed, would do not the slightest good. Nevertheless, the speech produced a strong impression in English political circles, and its effect was heightened by a supplementary speech delivered by Lord Rosebery on December 16 at Chesterfield. Lord Rosebery there said that the truth of the remarks he had made in July had been pretty well proven in the intervening months. For there had been no diminution in the meantime, but rather an accentuation throughout the British Isles of the sentiment comprehended by the one word "empire"; and whoever now disassociated himself from this sentiment should not be surprised if the nation disassociated itself from him. As to the minor pieces of advice which he had given the Liberals in July, time had also dealt gently with them. The hope persisted in by some Liberals that they might continue the nominal alliance initiated by Mr. Gladstone with the Irish Nationalists, had been finally dissipated by the action of the Irish themselves who had repeatedly that year in Parliament repudiated any connection with the Liberals, and had indeed ranged themselves definitely with the enemies of the empire. (See paragraph Irish Representation in Parliament.) And finally the brilliant opportunity which Lord Rosebery said, in July, was offered to the Liberal party, of espousing the present foreign policy of the Conservatives, but at the same time, freeing that policy from its gross mis-

management, had also been proven true in so far at least as the Conservatives had done nothing to increase their efficiency. Finally, the Conservative Parliament which adjourned in August had put hardly one useful domestic measure upon the statute books, and the great problems of temperance, housing the poor, and instituting a coherent national system of education remained still to be solved.

In commenting upon this speech of Lord Rosebery's, as well as upon his previous one, the press was inclined to take the attitude that while in the main Lord Rosebery's statements were correct, he had not yet offered to do the only thing of practical use, which was to offer himself as leader of his party. The present leader, Sir Henry Campbell-Bannerman, showed no inclination to resign, and Lord Rosebery apparently showed an even less inclination to attract a personal following. Moreover, as the press pointed out, a party in power always considered itself to be singularly efficient in administration, while naturally, and indeed necessarily, a party out of power claimed that it alone could save the country. As for Lord Rosebery's idea of solving the educational problem, housing the poor, and reforming the liquor trade, those things, remarked the *London Times*, were all very well in their time and season, but the main business on hand was the termination of the South African War. At the end of the year, the various divisions of the Liberals; those opposed to the war, led by Mr. James Bryce and Mr. John Morley; those more or less divided on the subject, led by Sir Henry Campbell-Bannerman; and those in favor of the war, led by Lord Rosebery, were still at odds; and the Irish Nationalists were definitely pressing disparate ends of their own. The one fact upon which all agreed was that the continuance of the war seriously weakened Great Britain's financial and commercial strength, guaranteed a more embittered final settlement in South Africa, and forced Great Britain to take an inferior position in international politics very different from that which she had been accustomed to occupy.

Irish Measures and Representatives.—One of the most pronounced features of the 1901 session of Parliament was the reappearance of a united Irish party under the leadership of Mr. John Redmond, intent upon gaining what they considered necessary reforms for Ireland, or, failing in that, of obstructing the legislative measures of the government. The active campaign of this party appeared to begin with the accession of King Edward to the throne; the Irish leaders maintaining that while they had owed a limited amount of allegiance to the Queen in her personal capacity, they owed no allegiance whatsoever to the King personally or officially, and did not intend to give it. As far as the acts of the Irish party in Parliament were concerned, critics of the government seemed to think that the exercise of a little more tact by Mr. Balfour, leader of the House, would have avoided much consequent trouble; but Mr. Balfour, it appeared, was extraordinarily fond of the closure, and whenever the Irish insisted on what they called their rights, they were at once blanketed by the ordering of the vote. As a matter of fact, as pointed out in December, 1901, by Lord Rosebery, 76 per cent. of all the supplies voted during the session were voted for under the closure, and this alone signified it was stated an improper tendency to restrict free speech on the part of the government. On the ordering of one of these closures on March 5, when a member of the Irish party arose to speak, a scene was raised that caused widespread excitement as well as the subsequent arrest of several of the Irish representatives. On this occasion several of the Irish members refused to go to their division lobby to vote as required under the rules. And when the deputy sergeant-at-arms endeavored to compel them to do so, they still resisted and the police were called in to arrest them. On March 7, the Ministerialists retaliated for this disturbance by changing the standing rules of the House so that members who refused to obey the speaker might be suspended from the service of the House for the remainder of the session. It was scarcely two months after this, on May 9, that by order of the Imperial government, the *Irish People* was seized in Dublin for printing what was described as a "gross, outrageous, scandalous, false and loathsome" libel upon his Majesty the King. In objecting to the seizure, Mr. John Redmond stated that the action of the Imperial government was inspired from the fact that the *Irish People* was the organ of the united Irish League, and that much stronger personal attacks had frequently been made by English papers upon the late Queen and the royal family without any unfavorable comment by the government. But upon a division as to the propriety of the seizure, the Irish party were defeated by 252 to 64 votes.

The reasons for the hostile attitude of the Irish in Parliament may perhaps be best shown by the measures on behalf of Ireland which they endeavored to have passed. The first was a motion to the effect that taxation in Ireland was steadily increasing, notwithstanding that the population was steadily decreasing, and that reductions in the taxes should therefore be made. (See paragraph Census.) To this the administration replied that out of every 21 shillings in taxes raised in the United Kingdom, Ireland contributed only 1 shilling 5 pence. Another motion was for the institution of a system of compulsory sale of lands by English landlords to their Irish

tenants instead of, as at present, a voluntary system of sale and purchase. To this the government answered that while land purchase by tenants should be encouraged in every way possible, it must be kept voluntary, as otherwise the Irish might repudiate their obligations on the recommendation of the Irish leaders. Another Irish motion was for the establishment of a Roman Catholic University in Ireland, so that the Irish would be given facilities for university education without having violence done to their religious feeling. To this proposal, Mr. Balfour said he was willing to give his personal assent, but the matter nevertheless was left pending. The final proposal of the Irish party was that the existing railway rates in Ireland constituted an intolerable grievance, and that the railroads should be either managed or purchased by the state so as to reduce the tariffs, and that certain waterways and rivers should be made navigable so as to increase facilities of transportation. As against this motion an amendment was carried, stating as the sense of the House "that while admitting the importance of developing the facilities of transit in Ireland, the time is not opportune for taking any steps which might act as a check to private enterprises and place a burden upon the public funds." Besides the really important measures which the Irish proposed there were others of less moment, but which were perhaps even more vexing to Englishmen. For example, on August 13, Mr. William Redmond objected to the historical title of the sovereign as "defender of the faith" on the ground that these words had applied originally to the Roman Catholic faith and that they were now "obsolete and absurd." But Mr. Balfour, as stated by an English paper, "met this ridiculous contention with some observations which were quite conclusive." In summing up all the trouble which the Irish had given Parliament during the session, the *London Times* on August 14 found, however, one consolatory fact, though it was probably not consolatory to the Irish League; and that was that "though the Irish members were peculiarly active and aggressive during the session, they extorted no legislation from the government."

After the session adjourned, the campaign of the Irish party still continued. Mr. John Redmond sailed for the United States with the apparent aim of enlisting money in the Irish cause, and in the fall there was elected to Parliament from the constituency of Galway in Ireland a Mr. Arthur Lynch who, if he had not been actually enlisted in the Boer army, as he claimed prior to his election, was at least an avowed sympathizer of the Boer cause. All these things tended to keep the question of the attitude of the Irish prominent and to destroy at least for the present any hope of a larger measure of home rule for Ireland. For as Lord Salisbury remarked, "If home rule had passed in 1893, what would England's position . . . have been to-day? We know now from our South African experience the danger of letting Ireland have a measure of independence. We know now that if we allowed those who are leading Irish politics unlimited power of making preparations against us, we should have to begin by conquering Ireland, if we ever had to fight any other Power."

Irish Representation in Parliament.—The pronounced, if acrid, ability to annoy the government displayed by the group of Irish nationalists in Parliament gave rise to the demand on the part of the English press that Ireland's representation in Parliament should be reduced proportionately to her population. From statistics brought forward by the *London Times*, it appeared that English representatives in Parliament were returned by an average of 10,897 electors each, Scotch representatives of 9,678, and Irish by only 7,144. Or, if the whole number of electors in the United Kingdom was divided by the total number of representatives and an average struck of electors to each representative, it would be found that England had 34 too few electors, Scotland 3 too many and Ireland 31 too many. While it was admitted that there were also anomalies in parliamentary representation as based on population in some of the constituencies of England and Scotland as well as in Ireland, it was alleged that the most glaring instances of over-representation were found in Ireland, and that the action of the Irish members themselves had proven that it was time to curtail the privileges they abused and to reduce Irish members to a just proportion with the population, intelligence, and wealth they represented. Moreover, as the *Spectator* pointed out, since two wrongs never made a right, the existing state of affairs could not be excused by saying that formerly Ireland had been as much under-represented as she was at present over-represented. In further advocacy of the reduction of the number of Irish members it was alleged that the Irish members were simply playing the part of obstructionists, and that the small parliamentary legislative record for the year was largely due to their persistent perversity. Mr. John Redmond, however, who objected to this statement, said that the truth was that as Parliament virtually acted as a local legislature for the counties and parishes of England, Ireland, Scotland, and Wales, attending to their petitions and composing their village frets, it had as a matter of course but little time left in which to enact legislation affecting the Empire as a whole. And Mr. Redmond added that Irish obstructionism was clearly fictitious, as Mr. Balfour on behalf of the English made immediate use of the closure when the Irish entered into the parliamentary debates.

Tour of Heir Apparent.—The tour of the Duke and Duchess of Cornwall and York to the principal colonies of the British Empire, extending from March 16 to November 1, 1901, excited much attention in England and served to reassure Englishmen as to the solidarity of the Empire at a time when such assurance was especially grateful to them. For all during the year unfavorable comments in Europe, and more especially in Germany, were continued, condemning both the initiation and the method of prosecution of the Boer War and expressing a pleasure at the many if not serious reverses to the British arms. As offsetting these sentiments expressed in unwearied Continental editorials and cartoons, Englishmen learned with pleasure that the Duke and Duchess of Cornwall had been received everywhere with lavish official hospitality, and assurances of the continued loyalty of the colonies. The Duke's trip was made ostensibly to open the first Parliament of Australia in accordance with arrangements made by Queen Victoria before her death. After having performed this duty on May 9 at Melbourne and having previously stopped at Malta, the Island of Ceylon, the Straits Settlements, and other British possessions, the Prince visited New Zealand, the island of Tasmania, and Cape Town, and from there sailed to Canada, arriving at Quebec on September 16, and journeying through the Dominion to Victoria and Vancouver on the Pacific Ocean. The Duke reached Portsmouth on November 1, after having traveled over 45,000 miles without having once set foot, except at Port Said, on any land where the Union Jack did not fly. In commenting upon his trip at a dinner given him by the London Corporation at the Guildhall on December 5, the Duke stated that the most impressive lesson of his tour was the loyalty everywhere manifested by the colonies and brought about both by the personal devotion everywhere felt for the late Queen and to the wise colonial policy which England had pursued for the last half century. Mr. Chamberlain, following out the same thought as to the importance of the loyalty of the colonies, stated that it was a matter of extreme significance that during the war, the Dominion of Canada and the states of Australia had between them sent an army of 18,000 men to South Africa and 50,000 more had been raised in South Africa itself. The underlying suggestion of Mr. Chamberlain that the military forces of Great Britain united with those of the colonies would allow Great Britain to be independent of the criticisms and animosities of the Continent, was generally approved by the English press. Certain critics, however, pointed out that the South African War was intrinsically a small affair, and that judged by modern armaments 18,000 men was an essentially small contingent. Australia and Canada were the principal, if not the only, colonies upon whom Great Britain could make levies for troops in case of a really serious war. But in such event not 18,000 troops, but ten times that number, would be required to compensate Great Britain for the loss of even an insignificant Continental ally.

Customs and Excise Law.—In presenting the budget proposals to the House of Commons on April 18, 1901, Sir Michael Hicks-Beach stated that the South African war taken in conjunction with the operations in China had already cost £153,000,000, or twice what the Crimean war cost (see paragraph Finance). For the fiscal year ending March 31, 1902, he estimated the expenditures at £184,212,000, providing that payments on the sinking funds were suspended, and the revenue at £132,255,000, thus leaving a deficit of £50,707,000. To raise the entire amount of this deficit by loans and so shunt the present burdens of the Empire upon the future generation, the chancellor would not agree to, and instead he proposed additional taxation to the amount of £11,000,000 annually. Of this £11,000,000 he estimated that an increase in the income tax from 1s. to 1s. 2d. on the £ would produce £4,700,000; duties on sugar, molasses and glucose would bring the amount up to £8,900,000, and an export duty of 1s. a ton on coal would add the remaining £2,100,000 required. Of the chancellor's proposals, that laying an expert duty on coal met with special opposition. It was argued that owing to the narrow differences of prices in the coal trade of the world, this duty would allow German and American coal to compete in Europe and other countries with English coal; and that thereby, through lessened exports, both the mining industry and the shipping industry which depended to a considerable extent upon it would be seriously affected. The amount of the injury, it was added, might be estimated from the fact that in 1900 the total value of the export coal was about £67,600,000. Notwithstanding these protests, however, the ministry adhered to their proposals. Sir Michael Hicks-Beach intimated that he would sooner resign his office than relinquish them, and the ministry in general contended that inasmuch as Germany imported twice as much coal as she exported, and as the United States in 1900 exported only 7,917,000 tons of coal, of which two-thirds went to British North America, the English foreign trade was in no immediate danger, and in any event if the shilling export duty lowered the price of domestic coal and reduced somewhat the extravagant profits of mine owners, at least manufacturing industries at home would be benefited through the possibility of producing more cheaply.

As approved on July 26, the Customs and Excise Bill provided that the 6d. import

duty on tea per pound should be continued; that an import duty should be laid on sugar of from 4s. 2d. to 2s. per hundredweight, depending upon the polarization test; that an import duty should be laid on molasses of from 2s. 9d. to 1s. per hundredweight, depending on quality, and also a duty on glucose of from 2s. 9d. to 2s. The bill further provided that the additional custom duties on tobacco, beer and spirits imposed by the act of 1900 should be continued; that an excise duty on glucose should be imposed; that the suspension of the new sinking fund and the suspension of payments on account of terminable annuities should be continued; that an income tax of 1s. 2d. on the pound sterling should be levied, to date from April 6; and that there should be an export duty of 1s. a ton on coal, to date back from April 19; provided, however, that the treasury might in its discretion remit the duty on coal exported before January, 1902, but contracted for before April 19, 1901.

Civil List Act.—The death of the Queen having rendered it necessary to make new provisions for the Civil List, King Edward relinquished, as did Queen Victoria at the beginning of her reign, the hereditary revenues of the Crown, now part of the consolidated fund, and Parliament made the following provisions for the royal family by an act approved July 2, 1901: The Duke of Cornwall and York was allotted £20,000 annually; the Duchess, £10,000, with a provision for £30,000 in event of the death of the Duke; each of the King's daughters were allotted £18,000 annually, and the Queen was allotted £70,000 in the event of the death of the King. The total payments and schedules under the civil list as passed amounted to £470,000 annually, distributed as follows: Their Majesties' privy purse, £110,000; his Majesty's household and retired allowances, £125,800; expenses of his Majesty's household, £193,000; works, £20,000; royal bounty, £13,200; unappropriated, £8,000.

Government Cordite Contracts.—The vehement criticisms directed against Mr. Joseph Chamberlain at the extraordinary session of Parliament which convened on December 5, 1900, on the ground that Mr. Chamberlain for himself and his relatives had interested himself in government contracts, especially in those given to the Kynochs' of Birmingham for cordite, resulted on March 20, 1901, in a trial for damages brought by Arthur Chamberlain, brother of Joseph Chamberlain, and manager of the Kynochs Company, against the *Star* and *Morning Leader* for comments published by those papers with reference to the munitions of war supplied by Kynochs' to the government. Both papers had charged that several large firms, and especially Kynochs', unwarrantably obtained admiralty contracts through Arthur Chamberlain's efforts, and by aid of the prestige of Joseph Chamberlain, who was interested in the contracts either on his own account, or through holdings of his wife, brothers, sons and daughters. At the trial a letter intended to invite business was put in evidence from the London manager of Kynochs' saying, "No doubt you are aware that we are largely contractors to the War Office, and we may say that our chairman, Mr. Arthur Chamberlain, is a brother of the colonial secretary." On cross-examination, Arthur Chamberlain admitted that the Kynochs' secured government orders for cordite when their tenders were higher than those of others. It was also brought out that Kynochs' had been allowed to revise their bids while other concerns had not, and that Arthur Chamberlain had endeavored to bring pressure to bear on various Irish members of Parliament with a view to securing for his firm government contracts. The sum of £200 awarded by the court to Mr. Chamberlain on March 26 hardly tended to allay the impression that the papers decided against had not been very far wrong in their statements, except in so far as they had made implications against Mr. Joseph Chamberlain.

Army Reorganization.—The endless criticisms upon the efficiency of the army, caused by events rising out of the South African War, and more especially by the difficulty experienced in raising an adequate number of troops within a short time, and by the inefficiency of the troops when finally recruited, resulted in 1901 in an army reorganization law intended to systematize the existing formations of the army, to increase efficiency and to make the army prepared for any future emergency. The law enacted in brief that the home army should be divided into six army corps, situated respectively in Aldershot, Salisbury Plain, Ireland, Colchester, York, and Scotland; the first three corps of the army were to consist entirely of regulars ready at any time for foreign service, and the other three were to include sixty battalions of specially trained militia and volunteers. In the first three corps was to reside the main aggressive military power of the Empire in case of war, and nothing was to be left undone to bring each corps as a unit complete in itself up to the highest state of efficiency. All the corps, but especially the three corps of regulars, were to be kept fully equipped and were to be commanded by those officers who would take them to the front in event of war. The total of new troops under this scheme was to be 680,000, an increase over the home force as previously constituted of 125,500. The total force of 680,000 was to be divided as follows: Regulars, 155,000; reserves, 90,000; militia, 150,000; yeomanry, 35,000; and volunteers, 250,000. That the plan of army reorganization as thus outlined promised well on the surface was not gain-

said; but it was feared that much difficulty would be experienced in recruiting troops up to the requisite number, and that as the payment for troops had not been materially increased the same difficulty would be experienced as previously of inducing men to enter the service. Heretofore England had not had sufficient regular troops in England to constitute one whole army corps fit for immediate service abroad, and it was thought that a jump from one to three fit army corps could not be easily made unless some more drastic measures were employed, as for example, the employment of the draft or the raising of the soldier's wage up to a point that would make it a distinct inducement for him to enlist.

The appointments made in the fall of 1901 by Mr. Brodrick, secretary of state for war, under the new scheme for army reform raised much dissatisfaction in the English press. For to the only three fully officered and equipped army corps, there were appointed as commanders, in the order of their importance: Sir Redvers Buller, Sir Evelyn Wood, and the Duke of Connaught. The Duke of Connaught could not, for obvious reasons, it was said, go to the front in case of war; Sir Evelyn Wood was physically incapacitated from doing so; and no one, according to the English papers, supposed that, in view of his war record, Sir Redvers Buller would again be given a command. Notwithstanding, then, the distinct assertion of the war office that "no general should henceforth be appointed on the peace establishment who would not be fit and capable to undertake his command in war time," and notwithstanding the fact that it was exceedingly important that the only three effective corps in the army should be commanded by actual generals, the whole principle at stake in the long-discussed army reform bill had been thrown away in the first appointments made under it. Against the appointment of Sir Redvers Buller, the press was especially clamorous, both because the first army corps was the most important of the several commands, and because Sir Redvers had, among other things, doubted the advisability of relieving Ladysmith early in the Boer War. The press indeed demanded point blank that Sir Redvers Buller should be dismissed, and this demand so angered the general that in a speech on October 10 he at once admitted the various charges brought against him, and at the same time claimed that there was no officer, his junior in the army, so well fitted as himself for the command he had been given. The press thereupon vociferated the more loudly for Sir Redvers Buller's retirement, and on October 22, the war office so ordered it, and substituted General French as commander of the first army corps. While this last appointment was regarded everywhere as an excellent one, it only served to increase the criticism against the war office. For, it was said, obviously the war office was in full possession of all the facts regarding Sir Redvers Buller's military career before his appointment was made. If, then, the appointment was a proper one, and if Sir Redvers Buller was the most efficient man who could be chosen for the position, the war office should not have dismissed Sir Redvers Buller merely because he had made an indiscreet speech, which in no wise affected his military ability. In brief, the press alleged that it was the especial business of the war office to appoint the most efficient man available for active service, and either the original appointment of Sir Redvers Buller or else his retirement showed incapacity on the part of the war office.

GREECE, a constitutional monarchy lying south of the Ottoman Empire. The capital is Athens.

Area and Population.—The area of the 26 nomarchies (provinces) comprising Greece is 25,014 square miles. The population rose from 2,187,208 in 1889 to 2,433,806 in 1896. Including the Greeks in Turkey, Asia Minor, and the islands of the Ægean and Mediterranean, the Greek nationality numbers over 8,700,000. In 1896 Athens had 111,486 inhabitants. Religious toleration prevails, but the state church is the Greek Orthodox, of which the great majority of the inhabitants are adherents. Primary instruction is nominally compulsory.

Government.—The executive authority is vested in the king, who is assisted by a ministry of seven members appointed by him and responsible to the legislature. This body, the *Boulé*, or Chamber, consists of one house of 207 members elected by popular vote. The reigning king is George I., second son of Prince, now King, Christian of Denmark, who was chosen to his present position by the Greek national assembly in 1863. The heir apparent is Prince Constantine, who was born in 1868.

Army and Navy.—Able-bodied men of over 21 years of age are liable to military service. The regular army in 1900 numbered 25,180 men, of whom 1,894 were officers. The war footing is placed at 82,000. Besides a number of torpedo boats and unprotected vessels, the navy consists of five armored vessels. The government has ordered the construction of 2 new cruisers, 4 torpedo-boat destroyers, and 6 torpedo boats.

Finance.—To insure payment of interest on the foreign debt Greek finance is in great measure controlled by a commission established after the Græco-Turkish war, comprising representatives of the six mediating Powers—Great Britain, Germany, France, Austria-Hungary, Russia, and Italy. Greek finance is on a gold and silver

basis; the monetary unit is the drachma, worth 19.3 cents. The value of the paper drachma, though variable, may be placed at slightly over 12 cents. Revenue and expenditure in currency drachmai have been estimated as follows respectively: 1899, 107,085,658 and 103,418,273; 1900, 112,206,849 and 114,088,468; 1901, 115,734,159 and 113,646,301. The largest items of revenue in drachmai, in the estimate for 1900, were: Duties and excise, 40,482,000; direct taxes, 22,856,000; stamps and dues, 20,327,400; state monopolies, 12,710,750. The largest estimated expenditures in drachmai for the same year were as follows: public debt, 32,609,650; department of war, 18,398,586; of the interior, 16,266,061. Exclusive of the debt of 1833, the gold debt at the end of 1899 amounted to 701,967,000 drachmai, and the charges 15,035,057 drachmai; at the same date the paper debt amounted to 173,690,760 drachmai and the charges 5,083,500 drachmai.

Industries and Commerce.—The chief industry is agriculture, though even this is hardly in a progressive condition. Industrial improvement, however, was noted in 1899 and 1900. The most important crop is currants. Mining is carried on to some extent; in 1899 the manganese iron ore produced amounted to 306,625 tons, hematite, 134,384 tons; zinc ore, 23,710 tons; lead ore and galena, 15,749 tons. The imports and exports in 1898 amounted to 153,219,038 drachmai and 88,221,601 drachmai respectively; in 1899, 128,085,906 and 94,665,611; in 1900, 129,986,066 and 102,080,518. The values in drachmai of the leading imports in 1899 were: cereals, 35,081,749; yarn and textiles, 20,827,756; wood and timber, 9,141,698; coal and other minerals, 8,910,480; raw hides, 8,715,618. Similar figures for exports were: currants, 38,007,954; ores, 23,860,014; wines, 6,480,924; tobacco, 2,826,871; figs, 2,438,772; silk and cocoons, 1,790,402; cognac, 1,448,889; sponges, 1,320,040. The imports come chiefly from Great Britain, Russia, Turkey (including Egypt), Austria-Hungary, France, and Germany, named in order of importance; the exports go principally to Great Britain, Turkey (including Egypt), France, Austria-Hungary, Belgium, Netherlands, and Germany.

At the beginning of 1900 there were 641 miles of railway; at the beginning of 1899 the total length of the telegraph lines, land and submarine, was 5,300 miles. It was reported in September, 1901, that the government had granted a concession to a British company for building a new railway between the Piræus and the Turkish frontier, connecting the Greek railway system with the international Orient roads.

HISTORY.

Parliamentary Affairs.—At the session of the Chamber which began on October 30, 1900, the cabinet of M. Theotokis, the premier, was supported by a somewhat reduced but effective majority. The opposition, however, by adopting filibustering methods was enabled to impede legislation, and the early months of 1901 were occupied with fruitless efforts to secure the passage of a number of measures which the Theotokis ministry had fostered, but upon which they were unable to force a vote in spite of the fact that the opposition was not sufficiently numerous to record an adverse majority. The deadlock did not extend to all legislation, but only to the ministry's measures for the reform of internal taxation and the law courts. On every question of national defense or of foreign relations the government majority became effective. The most important measure passed by the Chamber was that establishing a fund for rebuilding the national fleet. Such a fund was established by private donations some years ago, and had been receiving a government subvention. The fund is now regularly established as a national institution, the intention being to supersede, little by little, the old-fashioned navy with modern ships of war. The passage by the Chamber of an act providing accident insurance for miners was heralded as an entirely new departure in Greek legislation; being the first law of a socialistic sort to be placed upon the statute books. The act was a government measure, and its passage was not due to any social pressure, Greece having been particularly free from labor agitation. The only other legislation of importance was a series of acts relating to agriculture, establishing a government agricultural college at Larissa and providing for forest preservation. A movement for the reform of the constitution, begun during the year, was favorably looked upon by the ministry, it being recognized that parliamentary government in Greece is artificial and does not run smoothly.

The Bible Riots.—In the fall of 1901 an agitation begun by students in the university at Athens led to serious riots, and resulted finally in the retirement of the Theotokis ministry. The causes of the disturbance were complex, being of a mingled linguistic, religious, and political character. For a number of years a school of writers have been attempting to raise the present Greek vernacular to the rank of a literary language—a movement which has met with strenuous opposition from the educated upper classes, among whom the language spoken more nearly conforms to classical Greek. The quarrel assumed a religious aspect when the Gospels were translated into modern Greek by M. Ralli. The translation was intended only for

private use and was not designed to supersede the ordinary Greek Testament in the use of the church. Although the Holy Synod apparently disapproved of the enterprise, the Metropolitan, Mgr. Procope defended the Synod's point of view rather weakly, while it became known that Queen Olga, whom it will be remembered is a Russian grand duchess, was decidedly favorable to the translation. When a part of this translation was published in the *Akropolis* at Athens, the university students, especially those of the theological school, took up the matter seriously. Some opposed the translation on purely literary grounds, others on religious grounds, while still others, pointing to Queen Olga's attitude, thought they saw in it a movement toward Pan-Slavism. The discontent culminated November 19-21 in riots, in the course of which there was a demonstration against the Metropolitan, attacks on the newspaper offices, and finally a serious fight with the police, in which seven persons were killed and a large number wounded. In order to calm the rioters the government effected the resignation of Mgr. Procope. The feeling was so intense, however, that it seemed advisable to place the adjustment of the difficulties in new hands; so although the Theotokis ministry still maintained its majority in the Chamber, its members handed in their resignation, it being understood that they would lend their support to any new ministry constituted in the settlement of the question involved. M. Thrasybulus Zaïmis formed a new ministry. M. Zaïmis, who is a moderate conservative, and who was premier before the Græco-Turkish War, was looked upon by all parties as the man who could best be depended upon to end the unfortunate crisis.

Foreign Relations.—A treaty with Roumania was ratified early in the year. The treaty touched upon questions not only of commerce, but of religion, education, and law, and was looked upon as a drawing together of the two nations that might have in it an important bearing upon the politics of the Balkan peninsula. An interpellation in the Chamber as to the massacre of Greeks in Macedonia drew from the Theotokis ministry a statement of the relations of Greece with Bulgaria. Bulgaria had been disposed to shirk responsibility for the affair, but the Greek government had acted promptly, with the result that Bulgaria had agreed to punish the offenders if possible, and had given a half promise of other reparation. All parties supported the government warmly in its declaration that Greek interests in Macedonia were of the utmost importance, and that it should be a cardinal point of Greek policy to insist upon proper protection of the lives and property of the large Greek population in that region. A number of differences with Turkey remaining unsettled since the Græco-Turkish War were, in the fall of 1900, submitted for arbitration to the representatives of the six great Powers at Constantinople. Their decision, announced in April, 1901, was favorable to Greece on almost every point in dispute. The questions were mostly as to the standing of Greek subjects in Turkey, and the settlement resulted practically in a restoration of the privileges accorded them previous to the war of 1897, which Turkey had withheld. The most important points decided were the restoration of the extraterritorial jurisdiction of Greek consuls in Turkey, and the exemption of Greek citizens from taxation. See *ARCHÆOLOGY* (paragraph Greece) and *CRETE*.

GREEK CHURCH, comprising the Orthodox Greek Church and the Russian Orthodox Church, has an established constituency of nearly 100,000,000; in this country, of about 45,000, of which 40,000 are communicants of the Russian branch. See *TOLSTOY*, *LYOF*.

GREEN, EDMUND FISKE. See *FISKE*, JOHN.

GREENAWAY, KATE, English illustrator, died in London, November 7, 1901. She was born in London in 1846, the daughter of a wood engraver, and was educated in the London art schools and at South Kensington. Miss Greenaway first won notice as a maker of Christmas cards at the time when color presses came into use. In the illustration of children's books she set a standard, with *Under the Window* in 1879, to which illustrators had before failed to attain. Her pictures, charmingly fanciful in costume arrangement, and reminiscent in tone, caught the public taste. But back of the fanciful child and the sketchy, rough drawing, there was a carefully trained artistic sense, and Miss Greenaway's drawings always suggested real children at real, every-day games. Among her best-known illustrated books are: *The Pied Piper of Hamelin*; *A Day in a Child's Life*; *Mother Goose*; and *Kate Greenaway's Alphabet*.

GREENLAND, a Danish island situated northeast of North America, has an estimated area of 46,740 square miles and a population (1890) of 10,516. The capital is Godthaab. The Danish colonies extend along the west coast from about 60° to about 72° north latitude; on the east coast a mission and trading station was established at Angmagsalik in 1894. The trade of Greenland is a monopoly of the Danish government and regularly yields a small annual surplus. The imports and exports in 1899 were valued at 631,000 kroner (\$169,000) and 325,000 kroner (\$87,000) re-

spectively. The exports to Denmark include whale, cod, and carrion oil, eiderdown, and seal oil (10,000 casks annually), seal skins (30,000), fox skins (2,600).

GREENOUGH, JAMES BRADSTREET, American educator, died at Cambridge, Mass., October 11, 1901. He was born at Portland, Me., in 1833, and graduated at Harvard in 1856. After graduating at the Harvard Law School, he practiced law for a time at Marshall, Mich.; became a tutor of Latin at Harvard in 1865, and in 1873 was chosen an assistant professor. In the following year he was given the rank of professor, which he held at the time of his death, being an active teacher until 1899. Professor Greenough prepared, with Joseph H. and William F. Allen, a well-known series of classical text-books. Besides these he wrote *The Rose and the Ring: A Christmas Pantomime* (1880); *The Queen of Hearts: A Dramatic Fantasia* (1885); and a *Special Vocabulary to Virgil* (1883).

GREGORWITCH, CHARLES, Russian violinist, attracted favorable notice in 1901, during his second American tour. He was born in St. Petersburg, October 25, 1867, and received his early musical education under Wieniawski at the Brussels Conservatory, Dont at Vienna, and Joachim at Berlin. He first came to America in 1896, after touring most of the European countries. As a technician M. Gregorowitch takes high rank among contemporary violinists.

GREGORY, WILLIAM, governor of Rhode Island, died at Wickford, in that State, December 16, 1901. He was born at Astoria, N. Y., August 3, 1849, and was educated at the Westerly, R. I., high school. He became a prominent mill owner and banker. In 1888 he was elected to the Rhode Island Assembly, to the Senate in 1894, and in 1898 became lieutenant-governor, and two years later governor.

GRENADA. See WINDWARD ISLANDS.

GRIGGS, JOHN WILLIAM, former governor of New Jersey, and a well-known lawyer of that State, resigned the office of attorney-general in President McKinley's cabinet early in April, 1901. He was born at Newton, N. J., July 10, 1849, and graduated at Lafayette College in 1868. Three years later he began the practice of law at Paterson, N. J., and in 1876 was sent to the New Jersey General Assembly. From 1882 to 1888 he was a State senator, and was governor from 1896 to 1898, when he resigned to accept the post of attorney-general of the United States. His last prominent appearance in that capacity was in December, 1900, when he made an argument for the government's right to levy duty on imports from Porto Rico and other newly acquired territories.

GRIMM, HERMANN, German art critic and writer, died in Berlin, June 16, 1901. He was born at Kassel, Germany, January 6, 1828, and was educated at the universities of Bonn and Berlin. He became, in 1873, professor of the history of fine arts at the University of Berlin. His writing consisted chiefly of essays on literature and art, although he published a number of novels, a drama *Arminius*, and a tragedy, *Demetrius*. His greatest work was a *Life of Michel Angelo* (2 vols. Hanover, 1860-63).

GRIPPE. See INFLUENZA, EPIDEMIC.

GRUMBKOW, VICTOR VON (GRUMBKOW PASHA), lieutenant-general in the Turkish army, died on board the Orient express from Constantinople to Germany, July 1, 1901. He was born in Germany in 1849, and entered the Prussian army at an early age. Attaining the rank of lieutenant-colonel in the Prussian forces, he, with the approval of the German Emperor, entered the service of the Sultan of Turkey. Together with General von der Goltz Pasha, of the Prussian engineers corps, General von Grumbkow was largely responsible for the reorganization of the Turkish army, particularly the artillery. In 1897, in the Græco-Turkish War, he saw his reconstructed army victorious, and was decorated on the field with the Osmanieh Order. He held the rank of lieutenant-general and was an aide-de-camp to the Sultan.

GUADALOUPE, a French colony in the West Indies, consists of the two islands of Basse-Terre and Grande-Terre, and five small island dependencies. It has a total area of 688 square miles and an estimated population of 167,000. The colony is administered by a governor and elected council, and is represented in the French parliament by a senator and two deputies. According to the local budget for 1900, revenue and expenditure balanced at 4,968,324 francs. The public debt amounted to 1,200,000 francs. France expended for the colony, according to the French budget of 1901, 1,586,213 francs. The imports in 1897 amounted to 18,400,000 francs and the exports to 16,300,000 francs. The trade is largely with France. The chief product is sugar, of which 44,840 tons were produced in 1898.

GUAM, the largest and most southerly of the Ladrone or Marianne Islands, ceded by Spain to the United States by the Treaty of Paris in 1898, is situated about 5,000 miles west of San Francisco and 1,500 miles east of the Philippines. The area is estimated at 150 square miles, and the total population between 9,000 and 10,000. Agaña, the capital, has 6,400 inhabitants. The government is administered under

direction of the United States Navy Department by a naval officer acting as governor. The present governor is Commander Seaton Schroeder. Although over half of the island is arable, very little of it is under cultivation, and its chief value lies in its importance as a naval base and coaling station, on the direct route between the United States and the Philippines. Sugar, rice, corn, wheat, figs, indigo, cotton, and cocoanuts are produced, but the only product exported to any extent is copra. A good road connects Agaña with the port of Apra, where, during 1901, the United States government determined to erect extensive coaling-docks and naval store-houses. The reforms instituted by Captain Richard P. Leary (*q.v.*), the first American governor, have been extended and enforced by his successor, Commander Schroeder. The sale of intoxicating liquors to the natives, without special license, has been prohibited, and the land laws and marriage customs have been reformed, with the result that the inhabitants are in a better condition than they ever were under Spanish rule, and the encouragement of agriculture and the introduction of new systems of labor and taxation have improved the industrial and social life. A system of public schools has been established, in which sectarian teaching is prohibited.

GUATEMALA. the most northern republic of Central America. The capital is Guatemala City.

Area and Population.—The 22 departments comprising Guatemala have an estimated area of 48,300 square miles and a population of over 1,574,000. Of the inhabitants, about 60 per cent. are Indians and the remainder largely mestizos. The population of Guatemala City is about 75,000. The prevailing religion is Roman Catholicism. In 1900 the national schools numbered 1,419 and the attendance, excepting that at 39 night schools, was 56,802. In addition there were 72 private schools, with an attendance of 3,702.

Government.—The chief executive is a president, who is assisted by a cabinet of six members. The president for the six-year term ending with 1904 is Señor Manuel Estrada Cabrera. The legislative power rests with an assembly elected by popular vote. The regular army comprises about 7,000 officers and men, and the effective army nearly 57,000 men.

Finance.—The monetary unit is the silver peso, worth 42.8 cents on October 1, 1901. In 1900 the estimated revenue amounted to 9,770,000 pesos (4,340,000 pesos from customs) and the estimated expenditure 9,611,201 pesos (3,157,856 pesos for finance, 1,998,203 for war, and 1,513,915 for public instruction). The paper currency of Guatemala is greatly depreciated. At the beginning of 1900 the total foreign debt amounted to \$9,087,414, and the total internal debt 25,763,776 pesos.

Industries and Commerce.—Agriculture is the principal industry, and coffee, sugar, corn, bananas, tobacco, and cacao the leading products. The estimated coffee crop for 1901 amounted to about 480,000 quintals, a decrease of about 40 per cent. as compared with the crop of 1900. Various minerals occur but are little worked. For 1898 the imports and exports, valued in gold pesos worth approximately one dollar in United States money, were reported at 4,850,835 and 5,648,286 respectively; for 1899 the imports are estimated at about 5,000,000 pesos gold, while the exports amounted to 8,370,555 pesos gold. The principal imports are cotton goods, food-stuffs, beverages, and iron and steel ware. In 1899 the chief exports, with values in gold pesos, were: Coffee, 7,390,477; hides and skins, 267,970; rubber, 256,921; sugar, 250,360; and bananas, 118,047. In the imports the United States is first, sending about two-fifths of the whole; in the exports Germany is first, since that country receives about four-sevenths of the coffee exported. During the last few years the trade with Great Britain has greatly suffered to the advantage of that with Germany.

Communications.—There are reported 262 miles of railway in operation. Guatemala City is connected with San José, 85 miles distant on the Pacific coast. A line from Puerto Barrios, on the Caribbean coast, has been projected to Guatemala City, about 193 miles distant; this line has been constructed to El Rancho, a distance of 133 miles, and in January, 1901, definite measures were taken for the completion of the road. In 1899 there were 279 post-offices and 3,400 miles of telegraph line. During 1900 and 1901 considerable improvement was made by the government in the roads of the republic. See CENTRAL AMERICA.

GUINEA WORM. See FILARIA.

GUZMÁN, HORACIO, South American diplomat, died at Washington, D. C., April 23, 1901. He was born at Granada, Nicaragua, February 3, 1850, and was educated at Leicester Academy, Mass., in Paris, and at the Jefferson Medical College of Philadelphia, Pa., where he graduated in 1882. He was chosen to represent Nicaragua at Washington in 1887, in which capacity he remained, with a short interruption, until 1894, when he was appointed, with the consent of his own government, representative of the Republic of Salvador at Washington. He served also as Nicaragua's representative to Mexico. In 1897 Dr. Guzmán became secretary to the Bureau of American Republics, and was acting director at the time of his death.

GYPSUM. The gypsum produced in the United States in 1900 amounted to 504,462 short tons, valued at \$1,627,203, as against 486,235 short tons, valued at \$1,287,080 in 1899. The 1900 production was more than double that of 1898 in both quantity and value. The product in 1900 came from seventeen States and Territories, of which the most important were Iowa, Kansas, Michigan, and New York. This great output was due to the increased use of patent wall plaster in modern office buildings, for it is found that plasters made of gypsum are harder than those made of lime. Much gypsum was also used in the production of staff. The value of the crude plaster was \$1.24 per short ton, of land plaster \$1.91, and of calcined \$3.79 to \$3.91. The imports in 1900 amounted to \$315,530 and were the largest on record, coming chiefly from Canada.

HABIBULLAH, Ameer of Afghanistan, who succeeded to the title upon the death of his father, Abdurrahman (*q.v.*), on October 3, 1901, was born at Samarkand, in 1872. His mother was the daughter of the Mir (chief) of Badakshan. He is the eldest of the surviving sons of the late ameer. From his earliest years he has been thrown into close relationship with the administration of Afghan affairs, as early as 1888 being intrusted with the government of Kabul during the war with Ishak. Of his two years' rule at Kabul his father wrote: "I found he had governed the country . . . wisely, cleverly, and . . . entirely in accordance with my wishes. . . ." In 1897 he was placed in control of the state treasury, and at the same time was constituted "the Supreme Court of Appeal." With this training behind him he is expected to follow closely in the firmly peaceful policy of his father; and one of his first declarations was that of his purpose to increase the army efficiency, and at the same time to reduce the tax rate.

HADLEY, HENRY K., American composer, whose symphony, *The Seasons*, produced in 1901, won for him the Paderewski prize of \$500 for the best orchestral work in symphonic form. He was born at Somerville, Mass., in 1871. After studying music in Boston and Vienna, he became instructor of music at St. Paul's School, Garden City, L. I. He is the author of numerous songs and piano pieces; he has written much chamber music, a number of concert overtures, symphonies, ballads, comic operas, a cantata, *In Musical Praise*, and several ballet suites.

HAGAN, JAMES, Confederate brigadier-general, died at Mobile, Ala., November 7, 1901. He was born in Ireland, in 1821, and came to the United States in time to serve through the Mexican War. At the outbreak of the Civil War he was commissioned a captain, and after the battle of Shiloh was made colonel of the Third Alabama cavalry. During the last two years of the war he was a brigade commander under General Joseph Wheeler, and before the close of hostilities was commissioned a brigadier-general.

HAGUE CONFERENCE. As a result of the peace conference at The Hague in 1899, a permanent international court of arbitration has been formed, for an account of which see **ARBITRATION**, **INTERNATIONAL**.

HAILSTORM PREVENTION. See **METEOROLOGY**.

HAITI, a republic occupying the western portion of the island of the same name, the eastern portion of which is occupied by the republic of Santo Domingo. The area is 10,204 square miles, and the population (1900) 1,244,650, over 90 per cent. of whom are negroes, and most of the remainder mulattoes. The capital is Port-au-Prince, with a population of 70,000. The executive power is vested in a president (General Tiresias Simon Sam since 1896), elected for a term of seven years, nominally by the people, but in practice by the legislature, comprised of a senate and a chamber of representatives.

Finance.—The financial condition of the country is improving, and in 1900, for the first time in several years, the government was not obliged to resort to a loan to meet its current expenses. The revenue is obtained almost entirely from import and export duties, the former being payable in currency and the latter in American gold. Import duties in 1900 yielded \$4,293,097, as against \$2,573,230 in 1899, and the export duties \$3,332,300, as against \$2,811,847 in the preceding year. At the same time the expenditure decreased from \$7,255,193 to \$6,589,480. The public debt is about \$27,000,000. The monetary circulation, as reported early in 1901, had reached a total of \$7,444,390, of which \$1,250,000 was American gold. The United States gold dollar is the standard of value.

Industries, Commerce, etc.—The country is chiefly agricultural, and coffee, cacao, logwood, honey, hides, and cotton are the principal products. The imports increased in value from \$3,943,800 in 1899 to \$4,033,800 in 1900, and the exports from \$12,747,900 to \$13,608,000. The exportation of the four leading products increased in amount in 1900 over 1899 as follows (in pounds): Coffee, 72,122,781, against 61,622,184; cacao, 4,224,691, against 4,039,500; logwood, 106,066,469, against 82,836,302, and cotton, 2,050,128, against 1,471,992. Two-thirds of the export trade is with the United

States. The exportation of coffee would be much greater than it is were it not for an export duty thereon of \$3.80 per hundred pounds.

HALIBURTON, ROBERT GRANT, Q. C., Canadian lawyer and scientist, died at Pass Christian, Miss., March 7, 1901. He was born at Windsor, Nova Scotia, June 3, 1831, and was educated at King's College there, and admitted to the bar in 1853. He soon became prominent in his profession, and during his practice conducted many important cases. In 1870, when the government was about to withdraw the troops sent to quell the revolt of the newly acquired Manitoba territory, Mr. Haliburton succeeded in frustrating the act, by a timely discovery of the plan, and saved the territory to the Dominion. He was a publicist of repute and wrote many magazine articles on legal, scientific, and ethnological subjects.

HALIL RIFAT, PASHA, Grand Vizier of Turkey, died at Constantinople, November 9, 1901. He was born at Seres, Turkey, in 1807. Early in life he entered the public service as secretary in the office of the governor-general of Salonika, and advanced to provincial governor, at Widdin, and later at Rustchuk. Subsequently he was governor at Sivas, Smyrna, Bagdad, and Monastir. He entered the Turkish cabinet in 1893 as minister of the interior, and in 1897 was made grand vizier.

HALL, ASAPH, professor of astronomy at Harvard University, was elected president of the American Association for the Advancement of Science in 1901. He was born at Goshen, Conn., October 15, 1829. His education was received at the University of Michigan and at Harvard University, where he was assistant in the astronomical observatory from 1857 to 1862. In 1863 he was made a professor in the United States Navy and attached to the Naval Observatory, where he served until his appointment as professor at Harvard in 1895. He has taken a prominent part in all of the astronomical work carried on by the United States government, particularly in foreign expeditions. The most important of his discoveries was the two moons of Mars, in August, 1877, but he is also known for his observations of double stars and the satellites of Saturn, and has received many honors for his discoveries and investigations. He was elected a member of the National Academy of Sciences in 1875 and has served as its vice-president.

HAMILTON COLLEGE, Clinton, N. Y., founded 1812, has a faculty of 19 professors and instructors, and a student body of 183. There are 50 permanent scholarship endowments. The sum of \$50,000 has been donated anonymously for the erection of a commons. The library contains 41,386 volumes and 27,011 pamphlets, which represents an increase during 1901 of about 1,000 volumes and 3,600 pamphlets.

HARKNESS, HARVEY W., American physician and naturalist, died in San Francisco, May 10, 1901. He was born at Pelham, Mass., May 25, 1821, and studied medicine at Berkshire Medical College, Pittsfield, Mass., graduating in 1847. Two years later he went to California, where he established himself as a practicing physician, but found time to pursue entomological and botanical studies. From 1887-1896 he was president of the California Academy of Sciences, and to this organization he presented his botanical collection, numbering some 10,000 specimens. He was the author of many scientific papers, particularly in the department of cryptogamic botany.

HARMSWORTH, ALFRED CHARLES, editor and proprietor of the *London Daily Mail*, visited the United States in 1901, and illustrated his theory, that the newspapers of the future would assume a "tabloid" form, by applying his ideas to the issue of a New York morning newspaper. Mr. Harmsworth made this issue of the newspaper a thirty-two-page small quarto magazine, in which each item of news was disposed of in the most compressed form. He was born near Dublin, Ireland, July 15, 1865, and was educated at Stamford and under a private tutor. In 1882 he entered the office of the *Illustrated London News* in an editorial capacity, and in 1888 he started *Answers*, a weekly journal. The *Evening News* passed into his control in 1894, and two years later he founded the *Daily Mail*, following this in 1898 with *Harmsworth's Magazine*.

HARRISON, BENJAMIN, President of the United States from 1888 to 1892, was born in North Bend, Hamilton County, O., August 20, 1833, and died at his home in Indianapolis, March 13, 1901. He was the grandson of William Henry Harrison, ninth President of the United States, and the great-grandson of Benjamin Harrison, one of the signers of the Declaration of Independence and three times governor of Virginia. Of John Scott Harrison, father of Benjamin Harrison, the younger, it was somewhat ungraciously said that his only claim to distinction lay in the fact that he was "the son of a great father and the father of a great son"; but for all that he was twice elected to Congress. His son Benjamin received his elementary education, first at a log schoolhouse, then at an academy near Cincinnati, and finally at Miami University, Oxford, O., where he graduated in 1852. He immediately

began the study of law and was admitted to the bar in 1853. In the following year he removed to Indianapolis, where he afterward made his home. Mr. Harrison's political career began with the reorganization of the Republican party in 1860, when he canvassed the State and was elected reporter of the Supreme Court. In August, 1862, he took the field in the Union cause as colonel of the Seventieth Regiment of Indiana Volunteers, and was honorably discharged in June, 1865, having been brevetted brigadier-general. In 1868 he refused a third nomination for reporter of the Supreme Court and returned to the practice of law, gaining prestige steadily as a thorough, conscientious, and able attorney. In 1876 Mr. Harrison was an unsuccessful candidate for governor, though he ran 2,000 votes ahead of his ticket; in 1879 he was appointed a member of the Mississippi River Commission by President Hayes, and in 1880 he was chairman of the Indiana delegation in the convention which nominated James A. Garfield for the presidency. In 1881 the State legislature being then Republican, he was elected to the United States Senate. While in the Senate Mr. Harrison acted in pretty strict accordance with the views of his party. As chairman of the committee on territories he demanded statehood for the Dakotas, Montana, Idaho, and Washington; he opposed Cleveland's vetoes of pension bills and urged the reconstruction of the navy and the adoption of civil service reform. In the Indiana elections of 1886 the Democrats, having gerrymandered the State, obtained a majority in the legislature, although the popular vote was against them. Thus Mr. Harrison was not returned to the Senate, and the Republicans, feeling that he had been unjustly deprived of office and that his party record was deserving of high recognition, determined that he should be nominated for the presidency in the convention of 1888. Hon. James G. Blaine, then the most prominent Republican in the country, would not have the nomination, and as Mr. Harrison came from one of the great doubtful States, and was, moreover, solidly supported by his delegation, he was nominated on the eighth ballot as a compromise candidate.

When Mr. Harrison took the Presidential chair, his party in Congress proceeded promptly, at the session which met in December, 1889, to fulfill their pledges made in convention. The McKinley *protective* tariff of 1890, reversing the Democratic principle of a "tariff for revenue only," was one of the important measures passed. It did not, however, meet the approval of the country, and was, as subsequent events showed, largely instrumental in defeating the Republicans in the fall elections of 1890. A more important measure passed in 1890 was the Sherman Silver Bill. The Bland Silver Bill of 1878, providing for the coinage of not less than \$2,000,000 of silver per month, had only whetted the appetites of the silver-mine interests, and there was a widespread demand that silver should receive some more substantial recognition in the country's currency. President Harrison's position on this subject was intermediate between the silver radicals and the gold monometallists. "I have always been an advocate," he said in his first annual message to Congress, "of the use of silver in our currency. We are large producers of that metal and should not discredit it." At the same time, pending an international bimetallic agreement, "I think it is clear that if we should make the coinage of silver at the present ratio free, we must expect that the difference in the bullion values of the gold and silver dollars will be taken account of in commercial transactions." The plan which the President presented to Congress, through the secretary of the Treasury, in order to placate the silver interests, while at the same time maintaining the financial stability of the country, was to permit the secretary to issue certificates against the deposit of bullion at its market value. This plan was enacted in the Sherman Law of 1890, and the secretary was directed to issue treasury certificates against 4,500,000 ounces of silver monthly, or so much of that amount as was offered to him. Shortly before this time, in November, 1889, the coinage of silver dollars amounted to \$343,638,001, of which \$283,539,521 were held in the treasury. Under the operation of the Sherman Law the treasury largely increased its purchases, issuing, up to July 15, 1890, \$147,000,000 in certificates against silver bullion. While it has been generally considered by financial interests that President Harrison erred in his interpretation of the disturbing financial events which followed the passage of the Sherman Act, and that the panic of 1893 might in fact be pretty directly attributed to that act, yet in 1890 the silver interests were so strong in both parties that legislation of some kind was inevitable. What President Harrison really brought about was "a truce after long struggle between the advocates of free silver coinage and those intending to be more conservative." And having made the truce, the President declined to see it broken. In the political history of the country his administration was in this respect of great importance, that the Sherman Act and its repeal in 1893 forced to a definite and clear-cut issue, in which there was no middle ground, the question of gold monometallism *vs.* the unlimited free coinage of silver.

Pensions.—In accordance with his long-expressed conviction, President Harrison recommended that the pension law be made much more liberal. As this law stood when he came into office, Union soldiers and sailors were entitled to pensions if they

received disabilities resulting from service. The President urged that if former Union soldiers and sailors suffered from disability for any cause, they should receive pensions. The origin of disability, he said, was often difficult, and in many cases impossible to establish. There were, moreover, many men who, having been under arms for three or four years, were justly entitled to pensions for that reason alone. By the act of June 27, 1890, which Congress passed in accordance with this recommendation, allowing pensions to soldiers or sailors who had served 90 days or more, and who had subsequently become invalided for any cause except their own vicious habits, the value of the pension roll rose \$58,000,000 in three years; from \$72,052,143 on June 30, 1890, to \$130,510,179 on June 30, 1893.

Force Bill.—A bill for whose passage the President was very solicitous was that giving the Federal authority power to supervise State elections, in order that the entire negro vote might be cast and correctly counted in the South, as contemplated in the fifteenth amendment to the Constitution. It was urged against this measure that it would tread on State rights; that it was a political expedient for getting Republican votes from Democratic territory; that it would intensify and solidify sectional feeling, constitute a second Federal "carpet-bag" régime, and by again binding together in unified resentment the South against the North, work grave public mischief. The President, however, with the inflexible conscientiousness that was characteristic of him, continued to demand that the Constitution be complied with, whether or not it was practically expedient; and thereby he is said to have shown himself abler as a moralist and logician than a statesman and man of affairs. Notwithstanding a Republican schism and a solid Democratic opposition, the President insisted in his four annual messages that the national government should interfere in southern elections. His reasons were unanswerable in law and in "pure reason." Starting from the undisputed premise that in the South the negroes were by various devices deprived of any effectual exercise of the political and of many of the civil rights guaranteed them by the Federal law, the President reached the unavoidable conclusion that "the colored man should be protected in all his relations to the Federal government, whether as litigant, juror, or witness in our courts, as an elector for members of Congress, or as a peaceful traveler upon our interstate railways." Following the President's recommendations, bills were introduced in Congress; but their progress was delayed and retarded in committees, and they were finally shelved when an alliance was made known between the Democrats and a group of western Republicans, by which the latter were to vote against the Force Bill in return for the help of the former in obtaining silver legislation. The defeat of the attempt to secure for the negro the rights given him under the Constitution, coming, as the defeat did, after prolonged discussion and agitation, was generally considered as tantamount to an admission by the North that a mistake had been made in conferring those rights upon the negro. So far as legislation was concerned the subject was definitely dropped, the South being inferentially given to understand that within reasonable limits no bar would be placed upon its readjusting for itself its "peculiar problem."

Other Affairs of the Administration.—If the position of President Harrison on the matter of civil service did not entirely please reformers, it appeared to please his party leaders no better. "Honorable party service," said the President, "will certainly not be esteemed by me a disqualification for public office, but it will in no case be allowed to serve as a shield of official negligence, incompetency, or delinquency." To the letter and spirit of this statement the President kept with much exactness. While he paid numerous party debts, the politicians generally found him cold upon the subject of gaining unfair advantage through patronage dispensation, and they disliked him accordingly. In appointments to the bench, moreover, the President practically disregarded all partisan considerations, taking care only that both parties and all sections of the country should be ably represented.

Throughout his administration, President Harrison consistently advocated the increase of the navy. In his inaugural, he said: "Judged by modern standards, we are practically without coast defenses. The security of our coast cities should not rest altogether in the friendly disposition of other nations. There should be a second line wholly in our own keeping." In this respect the President agreed with President Arthur and President Cleveland, and urged that the work of steel naval construction initiated by them should be carried on with greater rapidity. The policy of the administration of President McKinley to develop American commerce with Central and South America, China, and Japan, and to subsidize American vessels for this purpose, was also definitely outlined by President Harrison, who saw great and growing possibilities in trade with those countries. The attitude of the United States toward Great Britain's apparent determination to take over "without the advice or consent of any other nation," territory generally considered to belong to Venezuela, and President Cleveland's famous message to Congress upon that subject in 1895, were both foreshadowed by President Harrison, who said, in Decem-

ber, 1891: "I should have been glad to announce some favorable disposition of the boundary dispute between Great Britain and Venezuela. This government will continue to express its concern at any appearance of foreign encroachment in territories long under the administrative control of American states."

The last distinguishing act of the President's administration was his endeavor, upon the overthrow of the monarchy of Hawaii at the initiative of the American residents, to obtain from the Senate the ratification of a treaty annexing Hawaii. The Senate, however, did not ratify the treaty in the few days intervening between February 15 and the President's retirement from office on March 4, and on March 9 President Cleveland withdrew the treaty and appointed a special commissioner to examine the conditions under which it had been sent from Hawaii. As this commissioner reported that "beyond all question the constitutional government of Hawaii had been subverted with the active aid of the United States representative to Hawaii," President Cleveland would not re-submit the treaty to the Senate, but endeavored instead, though unsuccessfully, to restore Queen Liliuokalani to power. With the accession of President McKinley in 1897, the Hawaiian policy of President Harrison was again adopted and the islands were formally annexed in 1898.

Failure of Reelection and After Years.—Taken as a whole, the administration of President Harrison was not marked by party harmony; and this, perhaps, as much as anything else, was the cause of his failure to be reelected. All during his term he was dogged with the charge of being "cold"; so cold that "his political advisers rode in ice wagons," that "grass would not grow on the White House grounds," and that "the Church of the Covenant, though afire, was safe enough as long as it held the President's pew." The fact availed him nothing that "when his friends were assailed and needed his support, his sympathy became a wall of granite around them." The important political consideration was, "he was hard to get along with," inflexible in his "convictions," and "obtuse on matters of every-day political expediency." On June 4, 1892, three days before the National Republican Convention met, James G. Blaine resigned from the cabinet and announced himself as a candidate for the presidency. But at that time Mr. Blaine was broken in health, his political following was largely dissipated, and the movement to nominate him could not but be abortive. William McKinley, who, it was thought, might easily have been nominated, absolutely refused, out of loyalty to the President, to consider such a proposition. Mr. Harrison, therefore, was renominated on the first ballot. In the November elections he was defeated by Grover Cleveland, the electoral vote being 277 to 145.

After his retirement Mr. Harrison gained steadily in repute and prestige. He was the principal counsel for Venezuela before the Anglo-Venezuelan Boundary Arbitration Commission at Paris in 1899, and was appointed by President McKinley a member of the Hague Arbitration Commission. Relieved from the burdens and prejudices of office, he appeared at once to broaden in many ways, and the people at large, in view both of his well-known integrity and the disinterested position he occupied, were prepared to defer to and widely quote any statements he might make on current topics. Like Senator Hoar, Mr. Harrison took sharp exception to President McKinley's colonial policy, and like Senator Hoar, he considered, nevertheless, that the Republican administration should be sustained in the elections of 1900. After President McKinley's reelection, Mr. Harrison was more outspoken upon the administration's Eastern policy, and his objections to it, as stated in his writings, were widely quoted.

On October 20, 1853, Mr. Harrison married Miss Caroline Lavinia Scott, daughter of the Rev. John W. Scott, and sister of ex-Judge John N. Scott, a practicing attorney of Indianapolis. He had by her two children, Russell and Mary, who afterward became the wife of Robert J. McKee, of New York. In October, 1892, Mrs. Harrison died, during the heat of the presidential campaign. In April, 1896, Mr. Harrison was married to Mrs. Mary Scott Lord Dimmock, his first wife's niece, by whom he had one daughter.

HARRISON, HENRY BALDWIN, former governor of Connecticut, died at New Haven, October 29, 1901. He was born at New Haven, September 11, 1821, and graduated at the head of his class at Yale University in 1846. He was admitted to the bar, and in 1854 was elected to the State senate. During his service he drafted the Personal Liberty Bill, which resulted in the practical nullification of the Fugitive Slave Law. Mr. Harrison helped to organize the Republican party in 1856, and in 1865 he was elected to the first of his four terms in the State assembly. As a Republican he was elected governor in 1884.

HART, JAMES MACDOUGALL, American landscape painter, died in Brooklyn, N. Y., October 23, 1901. He was born at Kilmarnock, Scotland, May 10, 1828, and was brought by his parents to the United States in 1830. He studied landscape painting at Düsseldorf in 1850-53. In 1859 he was made a member of the Academy of Design, in the council of which he served for a number of years. His best work was in landscapes, including cattle, and among his well-known pictures are: "The

Drove at the Ford" (in the Corcoran Art Gallery, Washington); "At the Brookside" (in the Metropolitan Museum of Art, New York City); and "In the Autumn Woods" (Sayles Memorial Hall, Providence, R. I.).

HARVARD UNIVERSITY, Cambridge, Mass., founded 1636, is the oldest, most influential, and still the largest of American educational institutions. Its student enrollment in 1901 was the largest in its history, showing a total of 5,576 in all departments. The teaching staff numbered 475, exceeding that of any other American institution, though its ratio of teachers to students, 1 to 11, is higher than in several other universities, notably Johns Hopkins, where it is 1 to 5. The year 1901 was marked by no special event, unless it was the great advance made by the medical school. From having the least satisfactory financial support of any of the professional schools a few years ago, it now can claim the best. Early in the year Mr. J. Pierpont Morgan signified his intention of supplying three of the much-needed buildings, at a cost, including buildings and lands, of more than \$1,000,000. Late in the year came the gift of \$1,000,000 from Mr. John D. Rockefeller as an endowment. In 1901, which was the last year that a candidate could enter the medical school without a bachelor's degree, the attendance considerably increased, though the relatively large numbers dropped at mid-year brought the attendance to the normal point. During the year the School of Veterinary Medicine was closed on account of lack of support, both in students and in funds. This is the first time that the university has ever been compelled to abandon a department of instruction once adopted by it. For some time the faculty has been considering the redefinition of the requirements for the degree of Bachelor of Arts, to the intent that the college course might be shortened to a three-years' term for the average student, without any material reduction of the standards. Many other institutions are merely waiting for Harvard to take the lead in this much-needed reform. While the faculty adopted no definite revision, they presented a clear statement of the present practices with regard to recommending for the degree candidates who have been in residence less than four years. Under this practice, any young man of industry and fair ability can obtain the degree in three years, if he makes, rather early in his course, an intelligent plan for accomplishing that object. In respect to the higher degrees, President Eliot calls attention to the long period required for the Doctorate, and to the fact that the average age of those taking the degree is 27 years, indicating an unnecessary expenditure of time at some period in the educational career. The position is also taken that the standards for the doctor's thesis are too high for a man of the maturity and experience that the candidate would have should the degree be taken at a proper age. As usual, the president's report is one of the most valuable educational documents of the year, many of the points discussed, as college athletics, research, and library reorganization, being mentioned in the article Universities and Colleges (*q.v.*). The additions to the library during the year were 16,000. In 1901 an extraordinary number of buildings were under construction for the university, namely, the Nelson Robinson, Jr., Hall for Architecture, the Semitic Museum, the Simkins Laboratory, Pierce Hall, and the Harvard Union. The total expenditure for these buildings was over \$820,000. For the endowment of the Robinson Hall of Architecture, \$300,000 was also given. There was a net increase for the year of over \$500,000 in the endowment funds, which now amount to over \$13,000,000.

HARVEY, Rev. MOSES, Canadian scientist and author, died at St. Johns, N. F., September 3, 1901. He was born at Armagh, Ireland, in 1820, and was educated for the ministry at the Royal College, Belfast. For eight years (1844-52) he was pastor of a church at Maryport, Cumberland, England, and went from there to St. Andrew's Free Church, at St. Johns, where he stayed until 1878, when he retired from active church work. In recognition of his scientific research, he was in 1886 elected a fellow of the Royal Geographical Society of England, and in 1891 a fellow of the Royal Society of Canada. In 1873 Dr. Harvey discovered the giant cuttle-fish, *Archethuthis Harveyi*, now in the Smithsonian Institution at Washington. His writings include: *Lectures on the Harmony of Science and Revelation* (1856); *A Text-Book of Newfoundland History* (1890); and *Newfoundland as It is in 1894*.

HATCH, JOHN PORTER, major-general U. S. V., died in New York City. April 12, 1901. He was born at Oswego, N. Y., January 9, 1822, and graduated at West Point in 1845. He served throughout the Mexican War, being brevetted twice for gallantry, and during the first year of the Civil War was appointed brigadier-general of volunteers in the Union army. He held command of a brigade under General Banks in the Shenandoah Valley campaign, and at the close of the war had attained the rank of major-general of volunteers and brevet brigadier-general in the regular service. Continuing in the service, he was retired in 1886 with rank of colonel.

HATZFELDT-WILDENBURG, Count von, PAUL MELCHIOR HUBERT GUSTAV, German diplomat, died in London, November 22, 1901. He was born in 1831, and was educated in law at the universities of Bonn and Berlin. Entering the diplo-

HARVARD UNIVERSITY.—Harvard Union.

matic service as attaché at Paris, he was later transferred to Washington, and returned to Paris as secretary of embassy in 1860. In 1867 he was appointed to the foreign office at Berlin, and there came into close and friendly relations with Prince Bismarck, whom he accompanied to Paris during the Franco-Prussian War. Retaining his position at Berlin until 1874, he was sent to Madrid as German minister, and there saw the end of the Carlist rising and the restoration of the monarchy under Alfonso XII. In 1878 he was sent as ambassador to Constantinople, where he did much to cement friendly relations between his country and Turkey. Again, in 1881, he was recalled to Berlin to be secretary of state in the foreign office, where he worked once more in complete harmony with Prince Bismarck. In 1885, upon the transfer of Count Münster from London to Paris, Count Hatzfeldt was sent to London as German ambassador. During his sixteen years tenure of this office he was instrumental in arranging the agreement of 1890 with regard to Africa and the cession of Heligoland, the Samoa agreement of 1899, and the agreement of 1900 with regard to China, as well as other important questions bearing upon German colonial and commercial enterprises.

HAWAII, or SANDWICH ISLANDS, a group of small islands in the Pacific Ocean, about 2,100 miles west-southwest of San Francisco, Cal. The islands were acquired by the United States under an act of Congress of July 7, 1898, and were organized as the "Territory of Hawaii" by an act of April 30, 1900. The capital is Honolulu, on the island of Oahu.

Area and Population.—The group includes 8 inhabited islands, with an approximate area of 6,449 square miles; the other islands are small and unimportant. The islands are volcanic in origin, and are largely composed of barren mountains, the only inhabitable portions being "the narrow strips of land extending from the bases of the mountains to the sea." Maui, Oahu, and Kauai comprise about 90 per cent. of the territorial area, and had in 1900 a population of 151,325, or 98.3 per cent. of the total. The total population of the islands, according to the census of 1900, was 153,727, against 109,020 in 1896 and 89,990 in 1890. By race the main elements constituting the population in 1900 were: Hawaiians, 29,834; part Hawaiians, 7,835; Chinese, 25,742; Japanese, 61,122, and Caucasians, 28,533. The number of Hawaiians has steadily declined, the death-rate continuing much higher than that of the other races, and the birth-rate lower. While in 1872 the number of Hawaiians was placed at 49,044, in 1900 the number had declined to 29,834. Many reasons have been assigned for this, but the true physiological cause appears unknown.

Receipts and Expenditure.—The principal sources of revenue for the Territory are taxes upon real and personal property, the sale of territorial internal revenue stamps, license fees, inheritance taxes, land rents, and land sales. Taxes levied upon real and personal property are limited to 1 per cent. of the assessed value of the property; but, unlike most assessments in the United States, the Hawaiian assessments are made upon the basis of actual cash value. To add, however, to the revenue of the Territory, an income tax of 2 per cent. was established by the legislature at its first session in 1901, and this tax, though appealed, was sustained by the courts. The assessed valuation of property in 1901 was \$121,172,928, as against \$100,297,460 in 1900 and \$78,963,297 in 1899. The receipts for the fiscal year 1901 were \$2,140,297.36 and the expenditures \$2,925,703.53; in 1900 the receipts were \$2,772,871.87 and the expenditures \$3,680,184.91. For the fiscal year ending June 30, 1892, the estimated receipts were \$2,565,500.

Industries.—The manufacturing industries of Hawaii may be divided broadly into two kinds: various small ones which are maintained only to supply the local demands of the islands, and one large industry, the manufacture of sugar, springing from and dependent upon the territorial supply of sugar cane. The gross value of all industries in Hawaii in 1900, inclusive of products valued at \$3,101,806 re-used in the process of manufacture, was \$24,992,068, and of this latter amount \$19,254,773, or 77 per cent. of the whole, was the product of the sugar manufacturing industry. Sugar mills of the best kind, equipped with modern machinery, have been built in Hawaii, and the continued and increased success of the industry is assured, provided that the sugar-cane supply is kept sufficient; but this is in turn dependent upon the labor supply, and the labor supply appears to be at present a matter of political consideration. See following paragraph; also *COFFEE*.

Labor Conditions.—The prosperity of Hawaii appears to depend absolutely upon the successful and economical production of sugar. Upon this production is based the only large manufacturing industry of the islands and the only article of export enabling the Hawaiians to carry on commerce with the mainland. Of other industries native to Hawaii there are none, and other agricultural crops have either never passed the experimental stage or else are limited in quantity to the needs of the islanders themselves. The wealth of Hawaii, therefore, depends upon her sugar crop. Before the act of 1900, by which Hawaii was made a Territory of the United States, Chinese and Japanese were brought freely to the islands to work in the

sugar fields, and an abundant supply of cheap labor was assured. But the act of 1900 applied the immigration laws of the United States to Hawaii, and thereafter it was impossible to import alien contract laborers. Immediately labor became scarce and its quality deteriorated. Americans were unable to withstand the severe work of the sugar fields, and the supply from the East being cut off, the remaining laborers were in much less need, competition being removed, to find favor with their employers. Moreover, many of the former laborers had already gained a competence and so returned to their own country, 4,079 Japanese alone leaving between June 14, 1900, and September 1, 1901, and only 589 arriving to take their place. This and other deficiencies were in part made up by the importation of some 2,000 Porto Ricans in the summer of 1901; but the plantations were nevertheless so short-handed that, as stated by the acting-governor in his annual report for 1901, "all sugar plantation stocks have fallen far below their former value, owing to the uncertainty of the labor supply," and "if no relief is forthcoming the most disastrous results will surely follow."

Education.—The progress of education in Hawaii, conducted upon the grade system, with English as the basis of instruction, appears by the report of the acting-governor for 1901 to be upon the whole satisfactory, although the lack of sufficient funds for the erection of necessary school buildings acts as a serious handicap. The department of education has endeavored to shape schools to the actual needs of the people, and in this effort has established night schools, industrial schools, and a normal school. The night schools are open to pupils of all ages and all nationalities; the normal school is conducted to enable young men and women to become teachers in Hawaiian schools; the industrial school for boys has been equipped with a site of 733 acres of land, and will, it is believed, soon become self-supporting; and an industrial school for girls is in process of organization. As to higher-grade education, it is pointed out with some pride that the graduates of the high school at Honolulu are accepted as regular students by several United States universities without further examination. The amount expended for Hawaiian schools for the year ending June 30, 1901, was \$306,299.56.

Franchise Question.—When Congress was formulating the territorial act for the government of Hawaii in the spring of 1900, earnest representations were made at Washington urging a property qualification for the right of suffrage, on the ground that a general suffrage, placing the Hawaiians and poorer classes in power, would be prejudicial to American interests. These arguments were, however, rejected by Congress, and the islanders were given practically universal suffrage. As a result the native Hawaiians would not ally themselves with either the Republican or the Democratic party in the elections of November, 1900, but formed an independent party, pledged to "home rule," or "Hawaii for the Hawaiians." This party triumphed at the polls, elected Robert W. Wilcox as delegate to Congress, and in the territorial legislature elected nine of the fifteen senators and twenty-two of the thirty representatives.

Fire Claims.—During the prevalence of the bubonic plague in Honolulu between December, 1899, and February, 1900, it was found necessary to condemn and order burned many buildings in the "Chinatown" section of the city. One of the fires thus occasioned passed beyond control, destroyed "Chinatown" entire, and rendered homeless some five or six thousand Chinese, Japanese, and Hawaiians. No relief was afforded to the losers until in 1901 the territorial legislature passed "an act to provide for the ascertainment and payment of all claims" caused by the fire, and appropriated \$1,500,000 for this purpose. The direct expenses incurred by Hawaii in suppressing the plague had already cost \$720,488.07, and up to August 28, 1901, the claims for fire damages had aggregated \$2,472,451.83.

Legislative Session.—The first legislative session of the Territory of Hawaii, beginning March 1, 1901, and ending sixty days later, was a disappointment to American residents in the islands and to those who believed that the territorial act devised by Congress in 1900 would insure a stable and progressive government. Under the practically universal suffrage which Congress enacted for Hawaii, the so-called Home Rule Party, composed of Kanakas and others opposed to American sovereignty, easily gained a majority in the legislature, and its members were said to have spent their time largely in inveighing against Governor Dole and in creating embarrassments for him. On the third day of the session the secretary of the Territory, Mr. Cooper, was ordered to retire from the House, although he was present in accordance with the provisions of the territorial act requiring him to "record and preserve the laws and proceedings of the legislature." Practically no business was transacted at the session, the attention of the legislature, when not directed against Governor Dole, being turned to the consideration of a county government law and the devising of a dog tax. No appropriation bills were even introduced. An extra session of the legislature had therefore to be called on May 8 for voting money to carry on the government. In a message to the senate

the governor informed the members that they had been "wasteful both of time and of money," and that the special session which he would call should be for the passage of the neglected appropriation bills and for that purpose only. In reply, the Home Rule Party sent a petition to Washington asking for the governor's removal, alleging that he had lost the confidence of the majority of the people; that he had not their best interests at heart; and that he had tried to take the heritage of the people from the rightful owners and give it to a favored few. The Home Rule Party stated, in addition, that the governor had exceeded the powers of his office; had appointed his nephew as attorney-general of the island; and had caused a great financial loss to the Territory by ordering the burning of certain parts of Honolulu during the fire of 1899. In the meantime the Republican members of the legislature signed a statement to be sent to Washington, unanimously indorsing the governor.

Territorial Needs.—In his report for the fiscal year ending June 30, 1901, the acting-governor, Henry E. Cooper, asked aid of the national government on behalf of Hawaii for the following purposes: To authorize the conversion of all Hawaiian silver coins, amounting, as originally issued in 1883, to \$1,000,000, into corresponding coins of the United States; to amend the immigration laws (see paragraph Labor Conditions) so far as to allow "the immigration of a limited number of Chinese laborers, conditioned upon their engaging in agricultural pursuits only during their residence in the Territory, and that upon their ceasing to do so that they shall return to their own country;" to authorize the services in Hawaii of an expert forester to report upon the condition of forests and upon the best method of conserving and extending them; to authorize the granting of licenses to direct water from lands where it is valueless to arid sections that are otherwise adapted to agricultural purposes; to authorize the retention by the Territory of a sufficient amount of the receipts of the customs house to pay all judgments awarded by the commission on fire claims.

Territorial Officers.—The territorial officers in Hawaii in 1901 were as follows: Governor, Sanford B. Dole (owing to the illness of Governor Dole, Mr. Henry E. Cooper was acting-governor during part of 1901); secretary, Henry E. Cooper; auditor, H. C. Austin; superintendent of public works, J. H. McCandles; superintendent of public instruction, A. T. Atkinson; commissioner of public lands, J. T. Brown; United States district judge, M. M. Estee; territorial chief justice, Walter F. Frear; attorney-general, E. P. Dole; delegate to Congress, W. E. Wilcox.

Haweis, Hugh Reginald, M.A., Anglican divine and lecturer, died in London, January 29, 1901. He was born at Egham, Surrey, April 3, 1838, and was educated at Trinity College, Cambridge, graduating in 1859. In 1860, while traveling in Italy, he became interested in the revolution and served under Garibaldi at the siege of Capua, several times narrowly escaping death. He was ordained a priest in 1862, and in 1866 he was appointed to the perpetual curacy of St. James, Marylebone. While unusually successful as a preacher, it was as an author and lecturer that he became best known. He was a Royal Institution lecturer, a Lowell lecturer at Boston in 1885, and a delegate to the World's Parliament of Religions, Chicago, 1893. He traveled all over the world to lecture and gather material for books, his itinerary between 1885 and 1895 being about 200,000 miles. His best-known lecture was *Music and Morals* (1871), which he delivered in many cities of the United States in 1893. Some of his writings are: *Thoughts for the Times* (1872); *Arrows in the Air* (1878); and *Christ and Christianity* (5 vols., 1886-87). He was connected with the *Echo*, was editor of *Cassell's Magazine* (1868-69), and contributed many articles to current periodicals, particularly *Memoirs of Garibaldi* for *Cassell's*. His wife, a well-known artist and writer, died in November, 1898.

Hawes, Josiah Johnson, American photographer, died in New Hampshire, August 7, 1901. He was born at Boston, in 1807, and early in life was a painter of oil portraits and miniatures on ivory. When M. Gourod went to Boston in 1841 to explain the daguerreotype process, Mr. Hawes took the American agency for it. He fitted up a photographic studio in 1843, and continued the business until the time of his death, numbering, among his early patrons and friends, Daniel Webster, Holmes Emerson, Longfellow, Whittier, and Kossuth.

HAY. The hay crop in point of value is second in importance in the United States. In 1900 its value was \$445,538,870, as compared with \$751,220,034 for corn and \$323,515,177 for wheat. In 1901 its estimated value was about \$500,000,000. In spite of the drought in several of the hay-producing States, the crop was apparently nearly an average one. The rate of yield in the Ohio Valley is estimated above the average for a series of years, which offsets the lower yield in the Mississippi and Missouri valleys. The shortage was the most serious in Illinois, Missouri, and Kansas, and to a less extent in Iowa and Nebraska. East of the Alleghanies, the hay crop was almost uniformly a large one. The acreage and yield in the principal hay-producing sections, as estimated by the *American Agriculturist*, together with its figures for production in 1900, are shown in the following table:

	Acreage.	Average Yield per Acre, Tons.	Production, Tons, 1901.	Production, Tons, 1900.
New England States.....	3,370,000	1.40	4,718,000	3,666,000
New York	4,405,000	1.30	5,726,000	4,050,000
Pennsylvania	2,585,000	1.25	3,230,000	3,029,000
Ohio	1,397,000	1.43	1,998,000	1,757,000
Michigan	1,174,000	1.26	1,479,000	1,556,000
Indiana	1,260,000	1.31	1,651,000	1,764,000
Illinois	1,656,000	.88	1,457,000	2,165,000
Wisconsin	1,249,000	1.25	1,561,000	1,377,000
Minnesota	1,622,000	1.34	2,173,000	1,577,000
Iowa	4,561,000	1.26	5,747,000	5,989,000
Missouri	1,875,000	.71	1,331,000	2,505,000
Kansas	3,649,000	.75	2,737,000	4,877,000
Nebraska	2,106,000	1.13	2,380,000	2,744,000
South Dakota	2,311,000	1.01	2,334,000	2,064,000
California	2,248,000	1.68	3,777,000	3,000,000
Oregon	573,000	1.52	871,000	1,013,000
Other States	5,979,000	...	7,811,000	7,943,000
Total	42,020,000	1.21	50,981,000	52,006,000

The average yields per acre are the only estimates published by the Department of Agriculture at Washington. The average of the latter for the whole country, 1.32 tons per acre, is slightly higher than that given above. The exports of hay, as computed by F. H. Hitchcock, chief of the section of foreign markets of the Department of Agriculture, were as follows for years ending June 30:

Countries to which Exported.	1900.		1901.	
	Tons.	Value.	Tons.	Value.
United Kingdom	22,175	\$291,464	30,374	\$479,931
Philippine Islands	10,544	162,199	16,693	325,994
British Africa	11,156	192,485	13,331	242,219
Mexico	4,487	50,355	7,374	118,031
Chinese Empire	8	85	9,273	114,243
Canada	4,054	48,530	6,053	100,670
Other countries	20,292	247,623	6,266	97,782
Total	72,716	\$992,741	89,364	\$1,476,870

The imports of hay in 1901, furnished by the same source, were 142,620 tons, valued at \$1,128,610, as against 143,890 tons in 1900, valued at \$1,019,000. These came almost exclusively from Canada. The hay crops of foreign countries are of little interest in this country, and only quite fragmentary data are available for 1901. For the cultivation of brome grass (*Bromus inermis*), see AGRICULTURE.

HAY, ADELBERT STONE, former United States consul at Pretoria, Transvaal, died at New Haven, Conn., June 23, 1901. He was born at Cleveland, O., in 1876 and was educated at Yale University, where he graduated in 1898. In 1899 he was appointed United States consul at Pretoria. He returned to the United States in 1900 and resigned his post in April, 1901. While attending the Yale commencement exercises he was killed by a fall from the window of his room in a hotel. He was the son of Secretary of State John Hay.

HAY, JOHN, secretary of state of the United States, was born at Salem, Ind., October 8, 1838, and graduated at Brown University in 1858. He entered the law office of Abraham Lincoln soon after leaving college and on Lincoln's accession to the Presidency was appointed one of the President's private secretaries, the other being John G. Nicolay (*q. v.*). As private secretary, Mr. Hay had access to practically all of the voluminous diplomatic correspondence carried on during the Civil War with the various European nations, and both on this account and through his necessarily intimate acquaintance with Mr. Lincoln and the war methods and policies which he advocated, Mr. Hay was later enabled to write in conjunction with John G. Nicolay the first exhaustive and, in the main, authoritative history of the Civil War both in its foreign and domestic aspects. Mr. Hay's diplomatic career proper began with his appointment as secretary of legation at Paris, and he then served in the same capacity at Madrid and Vienna, and later became *chargé d'affaires* at Vienna. For some time he was connected with the New York *Tribune*, and leaving that paper became first assistant secretary of state (1879-1881). In 1897-98 he was United States ambassador to Great Britain, and upon the resignation of Secretary Day from President McKinley's cabinet, September 30, 1898, Mr. Hay was nominated

to succeed him as secretary of state. Upon the death of President McKinley, Mr. Hay agreed to retain the state portfolio under President Roosevelt. The Spanish War and the negotiations with the Continental Powers which preceded it brought Mr. Hay into great public prominence, and this prominence was accentuated by the international negotiations which accompanied and followed the Boxer outbreaks in China and by the ratification, through Mr. Hay's efforts, of a new treaty with Great Britain with regard to the proposed Isthmian Canal. In connection with affairs in the Far East, Mr. Hay was the first of American statesmen to bring the United States prominently into the councils of the great nations concerning an affair external, strictly speaking, to the immediate interests of the United States. Mr. Hay gained the nominal consent, at least, of the various Powers interested to use their influence in maintaining the so-called open trade door in China, and he also employed the influence of the United States to reduce the extortionate demands for indemnities made by several of the Powers, and to prevent the official looting of China under more or less plausible pretexts of "necessary retribution." In both these respects, Mr. Hay made the policy of the United States practically identical at any rate for the moment with that of Great Britain and Japan. The Isthmian Canal convention with Great Britain, which was finally ratified by the Senate in December, 1901, followed a long course of negotiation made requisite by the refusal of the Senate to ratify a prior treaty in 1900, radically different in some respects from that finally adopted. Much credit was ascribed to Mr. Hay for being able at once to meet the objections which Great Britain made to the amendments introduced by the Senate in the earlier treaty of 1900, and at the same time to draw up such a new treaty as would be satisfactory to such a difficult body to handle as the United States Senate. He has published: *Castilian Days* (1871); *Pike County Ballads* (1871); a translation of Castelar's *Democracy in Europe* (1872); *Abraham Lincoln: A History* (1890); *Poems* (1890); and *Sir Walter Scott: An Address* (1897).

HAYDEN, CHARLES H., American painter, died at Belmont, Mass., August 4, 1901. He was born at Plymouth, Mass., in 1856. He studied in Boston and Paris. At the Paris Exposition of 1889 he received honorable mention; in 1895 he received the Jordan prize of \$1,500 at Boston, and a silver medal at the Atlanta Exposition, and he was awarded a bronze medal at the Paris Exposition in 1900. Most of Mr. Hayden's work was in landscapes, although his animal studies were also well known.

HAYTI. See **HAITI**.

HEART, WOUNDS OF THE. In April, 1901, an examination was made, with the help of the X-ray fluoroscope, of the heart of Charles B. Nelson, of Cadillac, Mich., who was shot in 1896. The bullet which nearly caused his death was seen in the heart, moving with each pulsation of the organ. In December, 1901, Dr. Nietert, of St. Louis, reported a case of a stab wound of the left ventricle of the heart. Twenty-four hours after the injury he opened the pericardium and emptied it of blood, whereupon the patient recovered consciousness. The surgeon then sewed up the wound in the heart. The patient died a day and a half later of shock, peritonitis, and suppression of urine. Nietert reports 22 other cases of wounds of the heart, all of which went to operation, and seven of which recovered. Ninety per cent. of such wounds without operative interference result in death.

HEDIN, SVEN ANDERS, a Swedish explorer whose explorations in Central Asia from 1899 to 1901 covered the Lob Nor region and part of Thibet, was born in Stockholm, February 19, 1865. He was educated at the universities of Upsala, Berlin, and Halle, and from the last named received the honorary degree of Ph.D. In 1885-86 he made his first journey of exploration, the results of which he published in 1887 under the title, *A Journey from Persia to Mesopotamia*. As a member of the Swedish embassy, he revisited Berlin in 1890, and in the following year traveled in Turkistan. The years 1892-95 he spent in a journey through Asia, penetrating into Thibet, and studying in considerable detail the Lob Nor district. This expedition took him from Orenburg on the Russian frontier through the Chinese empire to Peking. A full account of this trip was published by him in 1898 under the title *Through Asia*.

His latest explorations were begun in August, 1899, and had for their final object the tracing of the sources of the River Indus, in Thibet; but before he penetrated into that region he made a survey of the central region of Turkistan. He organized his caravan at Kashgar and sent it to Yangi-Kul. He himself floated down the Yarkand river from Lailik, and mapped it in 60 large sheets. This trip took three months. He met the caravan at Yangi-Kul and made a ten days' trip to Cherchen across the desert. In 1900 he pushed to the Lob Nor region and located and defined the boundaries of the ancient lake, around the southern shore of which passed the old caravan route, from Central China westward. On the shore of this lake he discovered salt beds. He also discovered the ruins of the ancient city of Altimish-

buluk, and from the evidences of ruined temples and manuscripts left by the Chinese he inferred that this city flourished some 2,000 years ago.

About the end of April, 1901, he set forth from Chaklik, on the southern border of Lob Nor, with 27 camels and 36 horses and mules. His intention was to cross Thibet diagonally from the Chimen-Tag to the sources of the Indus, passing south of Lake Manasarowar. He meant to visit the northern boundary of India, and there (having promised to restore his Cossacks to their native town) to return to Osh by way of Kashgar. The reports of this expedition are somewhat meagre, but apparently he decided to attempt to reach Lhasa, the sacred city of Thibet—an adventure which has been attempted by many explorers, including the American, William Woodville Rockhill, and the Englishman, Henry Savage Landor. The Lamas, who dread foreigners, are adverse to the presence of strangers in their city. They had captured Mr. Landor in 1897 and tortured him. Dr. Hedin disguised himself as a pilgrim and reached a point a few miles from Lhasa. He was then captured, but was well treated by the command of the Dalai Lama. He was released by the Lama, but made a second effort to reach the city, and this time was attacked by 500 soldiers, who destroyed his caravan. He then turned back and reached the British territory at Ladakh. A telegram from him sent to King Oscar of Sweden announced that on the second attack his baggage, including apparently his collections, was lost, but his note books were saved. He arrived at Leh, India, on December 20, 1901.

HELLMUTH, Rt. Rev. ISAAC, former Anglican bishop of Huron, Canada, died at Weston-super-Mare, England, May 30, 1901. He was born near Warsaw, Poland, December 14, 1820, and was educated at the University of Breslau. Born a Jew, he became, upon his removal to England, a Christian, and in 1844 was sent to Canada as an Anglican clergyman. In 1863 he became principal of the Huron Theological College, the endowment for which he collected in person, in 1871 bishop of Norfolk, and a few months later bishop of Huron. In 1883 he resigned his office and returned to England. He was the founder of Hellmuth College, London, Ontario. He wrote *The Authenticity and Genuineness of the Pentateuch*, and *A Biblical Thesaurus*.

HELY-HUTCHINSON, Sir WALTER FRANCIS, who was made governor of Cape Colony in January, 1901, was born in Dublin, Ireland, August 22, 1849. He was educated at Harrow and at Trinity College, Cambridge. After holding various colonial positions he became lieutenant-governor of Malta (1884), governor of the Windward Islands (1889), and governor of Natal (1893). In Natal he was active in inaugurating the system of "responsible government," and in effecting consolidation of that colony with Zululand and the trans-Pongola territories, which occurred in 1897. Upon the transfer of Lord Milner (q. v.) to the governorship of the Transvaal and the Orange River Colony, he was made governor and commander-in-chief of the Cape.

HENLEY, WILLIAM ERNEST, English poet and man of letters, published during 1901, in a review of two new biographies of Robert Louis Stevenson, a criticism of that writer which occasioned much protest. The substance of Mr. Henley's criticism was contained in the sentences: "At bottom Stevenson was an excellent fellow; but he was of his essence what the French call *personnel*. He was, that is, incessantly and passionately interested in Stevenson." Mr. Henley was born at Gloucester, England, August 23, 1849, and was educated in the schools of that town. He has edited *London* (1877-78), the *Magazine of Art* (1882-86), the *Scots Observer* (1888-93), and the *New Review* (1893-98). His published works, poems and essays, show a fine literary quality, and include *Views and Reviews* (1890), *Song of the Sword* (1892), *English Lyrics* (1897), and (with W. Nicholson) *London Types* (1898).

HENSCHEL, LILIAN (BAILEY), concert singer, died in London, England, November 4, 1901. She was born in Ohio in 1860, and studied music under her uncle, C. Hayden, and under Madame Viardot in Paris, and George Henschel, whom she married in 1881. After her marriage she was associated with her husband in vocal recitals and on concert tours throughout Europe and the United States. She was regarded as one of the most charming of soprano "lieder singers," and was exceedingly popular.

HERMITE, CHARLES, French mathematician and professor at the Sorbonne, Paris, died in that city January 14, 1901. He was born in Paris in 1822, and was educated at the Ecole Polytechnique. In 1856 he was elected a member of the Institute of France, and from this time a number of brilliant mathematical discoveries followed in rapid succession. In 1862 Professor Hermite was chosen to the faculty of the Ecole Normale, subsequently succeeding to the chairs of mathematics at the Ecole Polytechnique and the Sorbonne. He is considered the founder of a new school of geometry in France, and his work is well appreciated by mathematicians of all countries.

HERNE, JAMES A. (James Aherne), American actor and playwright, died in New York City, June 2, 1901. He was born at Troy, N. Y., in 1840, and received his first training as an actor in a theatre there. From 1859 to 1878 he played in various companies throughout the United States, and afterward performed the leading parts in plays written by himself. *Hearts of Oak* ran for a number of years, and following this he brought out (1885), *The Minute Men*, and (1886), *Drifting Apart*, both of which proved failures. In *Margaret Fleming* (1890), Mr. Herne reached his highest artistic level, according to some critics, but it was not until *Shore Acres* appeared in the later nineties that he scored another popular success. As a sympathetic and accurate delineator of types of every-day life Mr. Herne occupied a high place on the American stage.

HERZEGOVINA. See BOSNIA AND HERZEGOVINA.

HIRSCH, ADOLPH, Swiss meteorologist, died at Neuchâtel, Switzerland, April 18, 1901. Dr. Hirsch was born in 1830 and served as director of the observatory in Neuchâtel from its foundation in 1859 until his death. In addition to his numerous researches in astronomy and meteorology, he was well known for his work in the extension of the metric system of weights and measures. Dr. Hirsch was a member of the original Commission International du Mètre of 1872, and when the International Committee of Weights and Measures was organized under the terms of the metric convention of 1875 he was made its secretary, a position which he held at the time of his death.

HIRSCH, JOSEPH, French engineer, died in 1901. He was born in 1836, and was trained as an engineer in the Ecole Technique and the famous Ponts et Chaussées. He soon developed considerable talent in engineering enterprises and was employed on various works in France, Alsace, and Austria. One of his early notable works was the Houillères de la Sarre canal, for which he invented special arrangements to regulate the level of the water automatically. He became interested in the iron and steel works of his father-in-law, M. Dreyfus-Dupont, and originated many new and improved methods of operation. Becoming in 1876 a member of the faculty of the Ecole des Ponts et Chaussées, M. Hirsch occupied the chair of "The Steam Engine" for twenty-two years and also lectured on mechanics before the evening classes of the Conservatoire des Arts et Métiers. He held a number of important official positions, being in 1879 a member of the State commission of steam engines and in 1880 engineer-in-chief of the department of purchase and inspector of materials. He was actively interested in the Paris Expositions of 1878, 1889, and 1900, and prepared reports on the machinery exhibited, which were printed by the government. M. Hirsch was made a chevalier of the Legion of Honor in 1878 and an officer in 1900.

HISTORICAL ASSOCIATION, AMERICAN, founded in 1884 and incorporated by congress in 1889, held its annual meeting in Washington in the closing week of 1901. By pre-arrangement the annual meeting of the American Economic Association was held at the national capital at the same time, enabling the members of the two organizations to hold a joint session and discuss matters of mutual interest. The meeting was truly national in the character of its attendance, and from the interest displayed, the outlook for the work in hand was promising. Addresses were delivered by the presidents of both organizations. President Ely, of the Economic Association, discussed the question of *Industrial Liberty*, while President Adams, of the Historical Society, took for his subject *An Undeveloped Function*, in the treatment of which he urged that the Association as a body should take an active part in national politics, so as to secure as far as possible an adherence to sound principles and wise government. A visit of inspection was paid to the Congressional Library, where several papers on European history were read. An interesting matter connected with the visit was the presentation by the librarian, Mr. Putnam, of the outline of a scheme of cooperation, whereby the Congressional Library might be placed at the service of students of history. Among other papers read at the meeting were one by Professor A. Lawrence Lowell on *Party Legislation*, and one on *Economic Interpretation of History*, by Professor Seligman. The drift of Professor Lowell's paper was to show that the cry against the tyranny of party legislation in a great degree was not justified by facts, and that in this country only a small percentage of legislation, either State or national, is partisan. Other very valuable papers were presented at the meeting by Professor Osgood, of Columbia University, and Mr. Gaillard Hunt, of the Department of State. The membership of the Association now numbers 1,600, including 110 life members. President, Alfred T. Mahan, Washington, D. C.; secretary, A. Howard Clark, Smithsonian Institution, Washington, D. C.

HITTELL, JOHN SHERZER, American journalist and author, died in San Francisco, March 8, 1901. He was born at Jonestown, Pa., December 25, 1825, and graduated at Miami University, O., 1843. During the gold frenzy of 1849 he went to California and settled at San Francisco, where he was engaged in newspaper and

historical work. Some of his works are: *Evidences Against Christianity* (1857); *Spirit of the Papacy*; *The Resources of California* (1863); and *History of San Francisco* (1878).

HOBSON, EDWARD HENRY, brigadier-general, U. S. V., died at Cleveland, O., September 14, 1901. He was born at Greensburg, Ky., July 11, 1825, and was educated in the common schools. He served in the Mexican War and with the Union forces in the Civil War. In 1861 he organized and was made colonel of the Fifteenth Kentucky volunteers. He was for a time with General Buell's army, was in command of his regiment at Shiloh, and after various campaigns in Kentucky, Indiana, and Ohio, in pursuit of Morgan's raiders, was mustered out in 1865, with the rank of brigadier-general of volunteers. General Hobson was president of the Mexican War Veterans' Association at the time of his death.

HOCKEY, ICE. See ICE-HOCKEY.

HOFMANN, JOSEF, Austrian concert pianist, concluded his second American tour in 1901. He was born at Cracow, Austria, January 20, 1877, and received his musical education from his father, Casimir, at the Warsaw Conservatory until 1892, after which for two years he was the pupil of Rubinstein at Dresden. His first public appearance was made when he was six years old, and at the age of nine he made a tour of Germany, Denmark, Norway, and Sweden, playing also in Vienna, Paris, London, and (1887-88) in America. From that date until 1894 he studied, and then made his second debut at Dresden, after which he toured Europe again. He has written a number of piano pieces, and enjoys a well-established popularity as a technician and interpreter of delicate music.

HOHENLOHE-SCHILLINGSFÜRST, CHLODWIG KARL VICTOR, Prince von, former chancellor of Germany, died at Ragatz, July 6, 1901. He was born at Rotenburg, Bavaria, March 31, 1819, and was educated in law at the universities of Göttingen, Heidelberg, and Bonn. Entering the Prussian judicial service in 1842, he went from Ehrenbreitstein to Potsdam and thence to Breslau, where he remained until 1846, when he returned to manage his estates at Schillingsfürst. As a Bavarian magnate Prince von Hohenlohe sat in the upper house of the Diet until he went as Bavarian envoy to London in 1849. Brought into prominence by the changes resulting from the Austro-Prussian War of 1866, he became Bavarian premier and was a strong advocate of the plan to unite Bavaria with Prussia and the North German Federation, a stand which aroused great hostility in the anti-Union party, and necessitated his resignation in 1890. From 1871 to 1874 he was a member of the first German *Reichstag* and served as vice-president of that body. In 1874 he was sent by Prince Bismarck as German ambassador to Paris, and during his eleven years of service there he exerted a powerful pacifying influence upon French fears of fresh German hostility. From Paris, Prince Hohenlohe was sent in 1855 to Alsace-Lorraine as governor, one of the most difficult posts under his government. Here the new *Staatthalter* exerted the same influence for harmony that had made him trusted at Paris, one result of which was to secure adequate German representation in the administrative affairs of the province. Upon the resignation of the imperial chancellor, Count Caprivi, in 1894, Prince Hohenlohe became the third German chancellor and prime minister of Prussia. With the rise to influence of Count von Bülow, about 1897, Prince Hohenlohe's power began to decline, and in October, 1900, just prior to the meeting of the last diet, he resigned the chancellorship. "Of Prince Hohenlohe," says the London *Times* in a biographical notice, "it may be said that during his long career of 20 years in the midst of hostile population he has done more than any of his contemporaries to neutralize the bitter memories of the Franco-German War." That was his greatest work. As chancellor he did much to mollify the hostile Agrarians and Social Democrats and was responsible for the accomplishment of important reforms. For his moderate foreign policy, particularly in connection with affairs in China, which was commonly considered to be at variance with that of the emperor, he was sharply criticised by the German press, and to this, probably as much as his advanced age, was due his retirement from public affairs.

HOLLAND. See NETHERLANDS.

HONDURAS, a Central American republic, borders on the Caribbean Sea and touches the Pacific at the Gulf of Conchagua. The capital is Tegucigalpa.

Area and Population.—The 15 departments comprising Honduras have a total area of about 43,000 square miles. In 1901 the estimated population, exclusive of "savage" Indians, was 587,500; it is not unlikely, however, that this estimate is too high. The majority of the inhabitants are of Indian blood. Roman Catholicism is the prevailing religion, but there is no state church. Primary instruction is free, secular, and nominally compulsory. At the beginning of 1901 there were 768 primary schools, with 30,251 pupils enrolled. A "college" is maintained in each of the departments and a private university so-called is maintained at Tegucigalpa and Comayagua.

Government.—The chief executive is a president, who is assisted by a cabinet of five members. The legislative power rests with a congress of deputies. The president for the four-year term beginning February 1, 1899, is Señor Terencio Sierra. The regular army numbers only about 500 men. According to the report of the secretary of war, the total strength of the militia in 1901 was 40,079 men, an increase of 7,726 men over 1899.

Finance.—The monetary standard is silver and the unit of value the peso, which was worth in United States money 45.1 cents on October 1, 1900, and 42.8 cents on October 1, 1901. The principal sources of revenue are customs and taxes on alcoholic liquors. The reported revenue and expenditure for fiscal years were 2,351,240 pesos and 2,378,565 pesos respectively in 1899, and 2,824,131 pesos and 1,662,652 pesos respectively in 1900. The external debt with arrears of interest, unpaid since 1872, amounted in July, 1900, to £18,298,258 (\$89,038,473). The internal debt in 1900 was reported at 1,800,812 pesos.
